East Europe Report

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

AGRICULTURE GERMAN DEMOCRATIC REPUBLIC

VETERINARIANS AID LPG-VEG COOPERATION IN LIVESTOCK PRODUCTION

Jena MONATSHEFTE FUER VETERINAERMEDIZIN in German Vol 40 No 23, 1985 pp 793-797

[Article by Prof Dr H. Schwedler, Department of Veterinary Services, Ministry for Agriculture, Forestry and Foodstuffs; Code: State Veterinary Medicine, Socialist Veterinary Service,STGP (Adopted on 10 July 1985)]

[Excerpts] "Summary: Socialist Veterinary Services of the GDR - Developments and Challenge

The government-controlled veterinary group practice had been introduced in the GDR 30 years ago. An account is given of the history of the veterinary profession which had always been closely linked to class and ownership conditions in society. The opening of the first government-controlled veterinary practice on June 1st, 1955, in Leutenberg/Saalfeld District had ushered in a new phase in GDR veterinary services in keeping with progress of society at large. Reference is made to the achievements of the veterinary services in the GDR ever since, with emphasis being laid on the excellent performance of 15,000 people involved. Forthcoming priorities are expounded."

This year, members of the veterinary services of the GDR, together with the cooperative farmers and workers in the agricultural production cooperatives (LPGs) and the state-owned farms (VEGs), are celebrating a memorable result of the agricultural policy of the SED and in the history of our socialist state:

Thirty years ago, on 1 June 1955, the first state-run veterinary group practice in the GDR was founded in Leutenberg, kreis Saalfeld. Thereby a type of veterinary service for livestock production was introduced which corresponds to the socialist production conditions in the countryside.

After socialist agriculture had been strengthened, it was decided to go on to socialist intensification and gradual transition to industrial-type production methods through cooperation, which lead objectively to concentration and increasing specialization also in the area of livestock production. This posed entirely new demands on veterinarians and on veterinary medicine.

At the end of the 1960's, progressive veterinarians both in science and in practice applied their knowledge and know-how to the development and testing of industrial installations of livestock production. Naturally, this step in the development of veterinary medicine was not without conflicts. Yet the subjective reservations against such high animal concentrations--in some countries pejoratively called "animal mass production"--were overcome to the extent that we succeeded increasingly, through scientific solutions and practical testing, in combining construction techniques and animal physiological and hygienic requirements. Design engineers of the VEB agricultural construction project Potsdam, scientists of the research institutes for livestock production of the Academy of Agricultural Sciences, scientists of the Institute for Applied Animal Hygiene, veterinary scientists of the Karl Marx University, supported by many experienced farmers and practicing veterinarians; all of them constituted a firm and sworn fraternity which aided in the breakthrough of the development steps which had matured socially and objectively, as formulated by the SED. Today, almost 50 percent of all laying hens, almost all the broilers, and a large part of calves, yearlings, cows and cattle for slaughter, as well as sows, hogs and pigs for slaughter are kept in industrially produced installations where the animals number in four to six figures. These installations achieve significant and stable production performances.

Preventive measures, livestock health control, cleaning and disinfecting regimens and other veterinary medical measures have become developed to such an extent that effective and uninterrupted production can be guaranteed under those conditions if production management, subjective knowledge and know-how as well as strict observance of technological discipline are mastered. The experience garnered in the field of industrialized animal production in the socialist agriculture of the GDR is of great importance internationally. As veterinarians we are proud to have made our contribution to this development.

Applying primarily traditional technologies, a significant process of concentration and specialization in livestock production took place in the LPGs and VEGs, also. Veterinary medicine dealt with these social requirements. Cooperative veterinary work developed and linked itself even more closely with management and planning of livestock production and processing of its products.

While in a state veterinary practice the veterinarian worked alone or with a veterinary technician, a state veterinary group practice developed since the beginning of the 1970's, in which three to six veterinarians work together with an appropriate number of medium-level veterinary specialists such as veterinary engineers and technicians. This promoted significantly the effect of veterinary-medical care of livestock, scientific standards of veterinary measures through collective consultation, division of work and specialization of the veterinarians, and above all, the process of mutual education in the collective in assuming political and professional responsibility. Many managers and veterinarians of the government-run veterinary group practices have become outstanding and recognized personalities. Each veterinarian in such an establishment has his definite field of work and is responsible for certain LPGs and VEGs under the regional principle.

Integration of the veterinary collective in the installation collective and its management has proven helpful in the case of modern installations of livestock production with high animal concentrations. It ensures close linkage of the production tasks and veterinary measures in accordance with technological requirements and application of scientific-technical progress in livestock production. Cooperation of the veterinarians in managing and preparing the processes, and their share of economic responsibility, have a direct effect. This is also the case where the collective of a state veterinary group practice is assigned exclusively to caring for a modern livestock production installation.

Over-all, by carrying political and economic responsiblity, the veterinarians in individual and group state veterinary practices have more and more grown into the tasks of a close cooperation and alliance partner of cooperative farmers and workers, a responsibility firmly set down in the statute and operating rules of the LPGs of animal production, based on the law for agricultural production cooperatives. On the basis of the economic strategy of the SED, veterinarians active in primary animal production must focus on the following points of task fulfillment:

--Increasing foodstuffs and raw material supplies from livestock production, and securing the livestock through comprehensive preventive animal health care, further improvement of production hygiene, perfecting preventive health measures and animal care.
--Reducing production expenditure, lowering animal losses, and avoiding decreases in performance through further increasing the fertility and procreation performance of breeding stock; further increasing the rate of raising young animals through a systematic fight against infectious diseases and livestock epidemics and their elimination as a risk factor of livestock production.
--Making better use of the biological cycle of the animals and animal production, particularly by applying the findings of veterinary medicine to increasing performance per animal.
--Further implementing government order in the area of protecting livestock health against animal epidemics to secure state-owned and cooperative livestock property.

The SED and the government of the GDR have always ensured the development of the veterinary service according to national economic tasks. The development of working and living conditions of veterinarians and other veterinary service personnel has always been promoted with great care. The state and government have always appreciated the work of the veterinary service. Many veterinarians were recognized for extraordinary services with the National Prize, or given the title Meritorious Veterinarian, Chief Veterinary Counselor, Veterinary Counselor, and honored with national decorations.

More than 5,500 veterinary and other university cadres, 2,500 veterinary engineers, 7,000 mid-level veterinary experts and other personnel, a total of about 15,000 employees of the veterinary service, are experienced cooperation and alliance partners of cooperative farmers and workers in livestock production and the foodstuffs industry in implementing the decisions of the party of the working class and the government of the GDR. The veterinary service is a firm component of socialist state power in the GDR.

In the Ministry for Agriculture, Forestry and Foodstuffs and the bezirk and kreis councils there are special organizations of veterinary medicine. They provide
--veterinary care of animals and livestock, above all with the goal of advancing the orderly development and comprehensive intensification of socialist agriculture in the field of livestock production;
--cooperation in guaranteeing our people's health, above all through inspection of slaughter animals and meat, protecting the population from diseases transmittable from animal to man,and from harm caused by products and foodstuffs made from livestock. This also includes preventing harm from foodstuffs coming from spoilage of animals, and influencing improvement of quality and control of these foodstuffs;
--teaching and research in veterinary medicine.

Over 3,000 veterinarians in the field of livestock production work in state-run veterinary group practices and in veterinary departments of VEGs and LPGs. A corresponding number of veterinarians are employed in the veterinary hygiene inspections of the bezirk councils and in the veterinary hygiene services of the foodstuffs combines in the field of veterinary foodstuffs hygiene. In 15 bezirk institutes for veterinary services as well as in the Institute for Veterinary Pharmacology and Toxicology, they are supported by specialists for scientific-diagnostic tasks and special assistance.

Over 43 percent of veterinarians successfully concluded post-graduate university studies as special veterinarians for state veterinary sciences, cattle, hog, sheep, or poultry production, for foodstuffs hygiene, laboratory diagnostics, and for small domestic animals and pets. The tasks of securing and applying veterinary scientific progress are concentrated in four central veterinary institutes (State Institute for Veterinary Medical Testing, State Institute for Epizootic Epidemic Control, Ebers-walde Institute for Applied Animal Hygiene, Jena Institute for Research on Bacterial Animal Epidemics). The required number of veterinarians and other specialists is employed in the border veterinary service of the GDR, at the central office of the fish health service and in the bee health service, as well as in the central office for epizootoic rabies and wildlife hygiene.

Special tasks are carried out by the central office for standardization in the veterinary service, the central office for innovations in the veterinary service, the veterinary medicine section of the central committee of experts for the pharmaceutical trade, and the central committee of experts for veterinary instruments and technology.

The Dessau VEB Combine of Veterinary Vaccines has a staff of over 2,200, where production of vaccines, diagnostic aids and other bio-preparations for veterinary medicine is carried out in its main factory Dessau-Tornau as well as in its VEB combine plant "Friedrich-Loeffler-Institut Insel Riems." Efficient research sectors at Dessau and on the Isle of Riems ensure scientific-technical progress in this field. Many top performances were achieved there, and a significant export of vaccines was developed.

Of all veterinaries, 17.2 percent are women. They are employed in all sectors of the veterinary service. The great majority perform outstanding work with strong commitment.

The training of veterinarians is carried out in the field of veterinary medicine at the Karl Marx University of Leipzig and the Humboldt University of Berlin, in the sectors of livestock production and veterinary medicine. The engineering schools for veterinary medicine in Rostock and Beichlingen of the Ministry for Agriculture, Forestry and Foodstuffs train veterinary engineers for employment in veterinary establishments of livestock production, in the foodstuffs industry, and in laboratory diagnostics.

The Scientific Society for the Veterinary Service of the GDR, of which almost all veterinarians and about 90 percent of veterinary engineers are members, is in charge of the government-controlled continued education of specialized veterinary personnel. In 1984, a total of 13,623 specialized personnel received continued training within the framework of 207 scientific events held by the presidium, 9 expert commissions and 5 study groups. This also includes obligatory rotational extended training of veterinarians and specialized veterinarians.

The GDR veterinary service cooperates closely with the veterinary services and establishments of veterinary research of the USSR and the other socialist countries. In all important tasks to be tackled, there exists a stable and effective bilateral and multilateral cooperation on the basis of government agreements. Consultations among the managers of the veterinary services of the member states of CEMA ensures cooperation in strategic questions of development of the veterinary service. There exist government agreements with capitalist countries such as Austria, Italy, the FRG, the Netherlands, Belgium, and Denmark on cooperation in the area of veterinary service.

Of special importance to us is the cooperation in the International Office for Livestock Epidemics, in which 106 countries cooperate to avoid and fight animal epidemics, give impulses to scientific-technical progress in this area, and internationally standardize diagnostic methods and biocompounds.

Over-all, the GDR has an efficient and effective veterinary service, which is directed uniformly and universally in all its sectors by the Minister for Agriculture, Forestry and Foodstuffs through the veterinary-medical special section (director of the veterinary service). The veterinary service of the GDR enjoys a high international reputation. Today, the veterinary service of the GDR is even in the position of being able to offer international help to other countries, among them the People's Republic of Mongolia, the Republic of Cuba, Angola, and other African and Arab states.

Together with the cooperative farmers and workers of the agricultural and foodstuffs industry, and together with the entire working population, the members of the GDR veterinary service are preparing for the 11th SED Party Congress through new initiatives for the general strengthening of their worker-and-peasant state.

In the veterinary service,also, the goals of socialist competition in honor of the 40th anniversary of the victory over Hitler fascism and the liberation of the German people from Nazi barbarism were achieved and exceeded almost everywhere through politically responsible work and expert knowledge, supported by performance comparisons and the struggle for outstanding results.

At the veterinary congress of the GDR in 1984, members of the veterinary service discussed with Comrade Werner Felfe, member of the Politburo and secretary of the SED Central Committee, and with Comrade Bruno Lietz, Minister of Agriculture, Forestry and Foodstuffs, how they will contribute to performance growth and increased economic power in the GDR, and thus will support the securing of peace in accordance with the coordinated policy of the socialist community of states.

What tasks will we focus on in the work of the veterinary service during the coming period?

--We have to work with all our strength and persistence to further increase the results in raising young animals and to continue to reduce the losses in livestock due to death, sickness and emergency slaughter, and to keep it always at a minimum. This is the most visible expression of a high standard of livestock health in accordance with technological conditions, and has a great effect on the comprehensive intensification of livestock production.

--Reliable protection of valuable livestock in the LPGs and VEGs against epidemics and other dangers is of equal importance. Much has been achieved by securing stables and installations and increasing the impact of diagnostics and disinfection. The last meeting of the International Office of Livestock Epidemics clearly pointed out the growing danger of livestock epidemics in Europe, particularly with reference to African and classical hog cholera, foot-and-mouth disease, Aujeszky disease, and lung disease of cattle. Everywhere, we must strive for an even more persistent attitude toward protecting our livestock. Every measure of efficiency and reconstruction in livestock production must be combined with the guarantee of high standards in livestock epidemic protection.

--We must purposefully eliminate from livestock production certain livestock epidemics and infectious diseases as a production risk and cause of loss, as we succeeded earlier in the case of cattle tuberculosis, brucellosis, and infestation of cattle with warble fly larvae.

By the 11th SED Party Congress, we must succeed in freeing our hog herds from Aujeszky diease, transmittable gastroenteritis, clinical dysentery and leptospirosis. The fight must be continued against leucosis and other udder diseases causing great losses. The fight against salmonellosis in livestock production must be continued persistently through hygiene and vaccination measures. Important scientific work must be carried out in order to comprehensively eliminate other infections and diseases and to noticeably reduce the sickness rate of livestock.

--Together with livestock production institutions, we must strive for a further increase in effectiveness of artificial insemination as the dominant breeding method in cattle and hog production. It is an important basis for embryo implantation which further accelerates breeding progress, and for which we now jointly prepare the prerequisites in all cattle breeding centers.

--Further progress must be made in the field of diagnostic technology, the development of efficient methods of livestock health control, and further mechanization and automation of veterinary service processes. Although expenditures of the veterinary service were generally favorable, particularly due to expansion of significant preventive measures in livestock health care, a further increase in work productivity of the veterinary service itself is needed, i.e., a necessary increase in intensity of veterinary cooperation in livestock production.

--The government-controlled veterinary service and veterinary group practices will continue to be the determining organizational form of veterinary service in our republic. Greatest care and conscientiousness must be exercised in the collection and generalization of experiences, such as how the cooperation of veterinarians in the division-of-labor process of management and preparation of livestock production can be further increased and their responsibility expanded. This intensified work with the managing boards of the LPGs, the managements of VEGs, and the cooperation councils must above all be used to increase preventive treatment for animal health and performance.

This defines the development, goal and content of the work of the veterinary service as a firm component of the SED's agricultural and alliance policy.

On the occasion of the 30th anniversary of the government-controlled veterinary group practices, many veterinarians and other staff of the veterinary service, having co-created this development successfully and over many years, will be honored with certificates or state awards. This will enrich the socialist tradition of the veterinary service. It is both an incentive and an obligation to support with even greater commitment and effectiveness the cooperative farmers and workers of the LPGs, VEGs, in the combines of the foodstuffs industry and in other areas, in their responsible task of ensuring the food supply for all our people and achieving further performance and quality progress in honor of the 11th Party Congress of the SED.

EAST-WEST ECONOMIC COOPERATION SYMPOSIUM

Warsaw ZYCIE WARSZAWY in Polish 25 Nov 85 p 1

[Article: "East-West Economic Cooperation Symposium in Warsaw"]

[Text] The eighth symposium, the first to be held in Poland, of the Austrian-French meetings, East-West, closed in Warsaw. Poland and Hungary were participants. The symposium attracted approximately 130 educators and banking representatives from all four countries. Under discussion were problems of monetary policies, level and basis for setting prices and manifestations of inflation as well as the effect of these factors on economic conditions that prevail between socialist and capitalist countries.

The problem of prices in socialist countries and the effect of their levels on trade was a subject of broad discussion. Problems of monetary prospects were discussed in the same way. An exchange of views indicated that strong government interventionism has been noted in these areas in western countries also. The matter of overcoming inflation and its consequences for international trade conditions was also considered.

The participation of so many representatives of banking circles from both France and Austria indicates an increased interest in cooperation of those governments with Poland. Participants in the symposium had the opportunity to meet with the minister of foreign trade, Andrzej Wojcik, and with the minister of foreign affairs, Marian Orzechowski.

EAST-WEST TRADE DEALS REPORTED

Warsaw POLITYKA in Polish No 47, 23 Nov 85 p 14 supplement POLITYKA EKSPORT IMPORT No 22, Nov 85

[Article: "East-West"]

[Text] HUNGARY-GREAT BRITAIN: C. R. Braybrooke (Great Britain) and Magyar Huetoeipari (Hungary) concluded a joint venture agreement to sell and market Hungarian frozen fruits, vegetables and other "green" branch products in Great Britain. To increase sales, introduction of new products such as frozen cabbage, asparagus and pizza sauces has been proposed. C. R. Braybrooke has managed an agency selling Hungarian products for many years.

GREAT BRITAIN-BULGARIA: The British firm, Precision Air Control, Eden bridge, will install a climate control system consisting of two central ventilators and three climate control units in a newly constructed Bulgarian printing plant. The new printing plant, equipped with the most modern polygraphic facilities procured mainly from Great Britain, was funded by the Ludmila Ziwkowa International Foundation.

ROMANIA-BURKINA FASO: Romania recently confirmed its interest in participating in extending credit and in priority investments in Burkina Faso, including the construction of the Sahelian rail line, a manganese mine in Tambao, and cultivation of 500 ha of irrigated desert land in Sourou. The first binding agreements in this matter were concluded during the most recent meeting of the joint commission in Ouagadougou, the capitol of Burkina Faso.

YUGOSLAVIA-GREAT BRITAIN: The Yugoslavian electronics enterprise, El, signed a long-term agreement with the British firm, Rank Xerox, on the production in Yugoslavia of all types of copying machines. Production cooperation between the two firms is to develop gradually beginning with the first quarter of 1985 so that in 7 years, the value of the mutual product exchange might reach the £6.7 million quota.

HUNGARY-U.S.A.: The first lot of 15 tons of Hungarian salami found its way from New Jersey to the American market through the mediation of Universal Foods Corporation. The introduction of this traditional Hungarian smoked meat product to this market was preceded by an intensive advertising campaign organized by Universal Foods and the Hungarian Terimpex. The export of salami to the U.S.A. may soon reach a volume of 100-150 tons annually.

GREAT BRITAIN-CZECHOSLOVAKIA: The glass factory in the Teplice area ordered a complete control system for its production line from the British firm, Kent Process Control. The cost of the equipment is £750,000.

YUGOSLAVIA-JAPAN: During the next 5 years, the Yugoslavian producer of baby foods, Juvitana, plans to export products to Japan worth a total of $20 million. The Japanese firm, Wellestone Enterprise Co. Ltd., will handle the sale of 11 types of baby foods on the Japanese market.

FINLAND-USSR: The Finnish construction firm in Helsinki, YIT, received an order for work on enlarging the exposition area of the Tretyakov Gallery in Moscow. The contract includes alterations in an area of more than 10,000 m^2 and supplying and installing whole units of technical equipment. The new installation will be ready for visitors in October, 1987. The contract is worth 100 million Finnish markkas.

YUGOSLAVIA-U.S.A.: The export of Yugoslavian wine to the U.S.A. increased threefold, reaching $1.5 million. The specialists believe that the reasons for this commercial success are the larger assortment of Yugoslavian wines available and more advertising. Yugoslavia exports $5 million worth of wine annually.

SWITZERLAND-HUNGARY: The Swiss concern, Sulzer, opened an office in Budapest to promote its technology and equipment on the Hungarian market, mainly for the chemical and textile industry. At the same time, Sulzer is buying Hungarian electrical equipment to be installed in Swiss plants.

USSR-FINLAND: These countries signed an agreement in Helsinki to cooperate on environmental protection. The basic points of the agreement include joint resolution of problems dealing with rational use of natural resources and expanding measures to decrease pollution of air, water and soil and conserve flora and fauna. Plans were made to standardize methods of studying and monitoring the environment. This is the first international agreement of this type between Finland and the government of another country.

USSR-ARGENTINA: Mashpriborintorg, the USSR central office for foreign trade, signed an agreement with the government of Mendoza Province to provide meteorological instruments worth 1.3 million rubles. The instruments are expected to arrive in Argentina this year.

HUNGARY-SWEDEN: Hungarotex and Inetinvest, two Hungarian enterprises involved in foreign trade and promotion, and the Swedish firm, Moelnycke Consumer Products, established a new enterprise in Budapest with initial funding of 100 million forints. The shares of the firms are 34, 17, 49 percent respectively. Beginning next year, the new firm, Sancelia Hungary Co. Ltd., will produce disposable diapers. Of this production, 3/4 will go to the Hungarian market, and 1/4 will be exported.

FURTHER REPORT ON EAST-WEST TRADE DEALS

Warsaw POLITYKA in Polish No 51/52, 21-28 Dec 85 p 23 supplement POLITYKA EKSPORT IMPORT No 25, Dec 85

[Article: "East-West"]

[Text] WEST BERLIN-USSR: Berlin-Consult GmbH, a West German engineering enterprise, received an order from the USSR to build a factory in Zaporoze, Ukraine, to produce magnetic heads for tape recorders at a rate of 880,000 units annually. The factory is to begin production in 1987. This is the second factory of this type that Berlin-Consult GmbH will build in the USSR. The cost of the contract is 32 million marks.

YUGOSLAVIA-AUSTRIA: The Yugoslav bank, Yugobank of Belgrade, concluded an agreement with the Genossenschaftliche Zentralbank A. G. in Vienna for granting credits to Yugoslavs working temporarily in Austria. Those Yugoslav workers who have open savings accounts in Yugobank will have access to credits. Individual credit will range from 10,000 to 500,000 schillings and will be granted according to conditions prevalent in Austria.

AUSTRIA-CZECHOSLOVAKIA: An Austrian information office of the firm, Festo-Maschinenfabrik GmbH, opened recently at the Polytechnicum in Koszyce. A series of lectures and exhibitions on construction and installation of pneumatic control systems and measuring equipment will take place at this center. The purpose of the seminars is to increase technical knowledge concerning pneumatic control systems, which, in the opinion of representatives of the Austrian firm, will lead to increasing Czechoslovakian orders for Festo products.

ROMANIA-THAILAND: Both countries recently signed two separate trade agreements. The first is a 3-year agreement that requires Romania to provide Thailand with agricultural machinery, tractors, artificial fertilizers, wine and alcohol in exchange for tapioca, rice, sugar and other agricultural products. The second, a 5-year agreement, pertains to exchange of similar goods, but extends the kinds of commercial goods supplied by Romania. Thailand will act as middleman in the sale of crude oil to Romania. The total value of both agreements is $260 million.

USSR-GREECE: Following a series of conferences, representatives of both countries signed an agreement for the joint construction of an aluminum plant to be located near the Greek city of Delphi, 160 km west of Athens. Construction is to begin early in 1986 and will take 5 years. At full capacity, the aluminum plant will produce 600,000 tons of aluminum annually, of which 380,000 tons will be supplied to the USSR. The technical plans of the entire investment enterprise were developed by USSR specialists. The final agreement for joint construction was reached after 6 years of discussions in which the partners worked out the details of the undertaking. The value of this investment is $480 million. Discussions between Bulgaria and Greece concerning a long-term agreement for the purchase of significant amounts of aluminum from Greece are in progress. This country has documented bauxite deposits amounting to 100 million tons.

HUNGARY-AUSTRIA: Vasert, a network of stores selling domestic articles, opened a new division in Budapest in which it will be possible to buy products of the firm, Kludi, (mainly bathroom fittings) for forints. The Austrian firm has cooperated for many years with Hungarian enterprises that supply parts and semi-manufactured products to the Vasert affiliate in Hornstein; the value of the cooperative exchanges during 13 years of mutual cooperation between Hungarian enterprises and Kludi amounted to 1.2 billion schillings. Finally, cooperative agreements were extended for 5 years; during this time mutual exchange of goods will amount to 700 million schillings.

JAPAN-USSR: The Soviet office, Technointorg, ordered a lot of 130 knitting machines from the Japanese manufacturer, Chori Co. Ltd., to be supplied to the USSR as early as in 1985.

INTERNATIONAL SEMINAR ON CEMA INTEGRATION

Warsaw RZECZPOSPOLITA in Polish 28 Nov 85 p 2

[Article by A. S.: "Economic Integration of CEMA Countries, Seventh International Student Seminar"]

[Text] The seventh international student seminar, "Economic Integration of CEMA Countries," opened in Warsaw on 27 November in the Main School of Planning and Statistics. These seminars are usually organized every second year. Participating in the seminar that opened yesterday are delegates of all socialist countries, students from Switzerland and Finland and representatives of developing countries who are studying in Poland. In addition to the students, educators and representatives of the economy and of Polish foreign trade enterprises are also participating. The minister of foreign trade, Andrzej Wojcik, is the honorary sponsor of the seminar.

ITALIAN FIRMS EXPLOIT OPENINGS IN YUGOSLAV MARKET

Milan ESPANSIONE in Italian in January 1986 publishes on pages 149 and 152 an article by Luigi Orescano entitled "Yugoslavia: A More Aligned Import." The article foscuses on Italian-Yugoslav industrial joint ventures in footwear, machinery, chemical products, fabrics, automobiles, etc. Due to Yugoslavia's negative trade balance of payments, Italian firms often rely on countertrade through specialized firms representing Yugoslav trade groups and working as middlemen. The article includes a list of some of the main trading firms operating in Italy for Yugoslavia. For the text of Orescano's article, see pages 143-146 of the WEST EUROPE REPORT JPRS-WER-86-018 of 19 February 1986.

ITALIAN PRESS ON OBSTACLES TO TRADE WITH BALKAN COUNTRIES

Milan ESPANSIONE in Italian in January 1986 publishes on pages 152-153 an article by Sergio Luciano entitled "The Balkans Are Beautiful When You Manage to Sell." The article cites Bulgaria's and Romania's growing interest in Italian products. Trade with Romania, however, has been hampered by Romanian problems with payments, delivery of goods, and quality of product. Trade with Bulgaria, which has suffered from recent political issues, has begun to recover only this year. Luciano focuses on the difficulties in trading with both Romania and Bulgaria, but states that countertrade in Bulgaria is declining. Also according to Luciano, machinery and technology could be the most promising sector for Italian industry in Romania. The article provides a list of some of the main commercial intermediary companies in Italy that operate with Bulgaria and Romania. For the full text of Luciano's article, see page 147 of the WEST EUROPE REPORT JPRS-WER-86-018 of 19 February 1986.

FOREIGN TRADE IN AGRICULTURAL PRODUCTS NOTED

Prague ZAHRANICNI OBCHOD in Czech No 8, 1985 pp 2-6

[Text] Foreign trade in agricultural products in all economically developed countries, and in the international context as well, possesses certain specifics which set it apart from other groups of commodities in international trading. These distinctive features are determined not only by the biological nature of the traded products and the place food holds within the structure of necessities, but above all by the modified, administrative systems governing agriculture, an increasing turning away from market relations, and the creation of more or less independent agricultural, agricultural-food processing, or agricultural-industrial complexes in individual countries or groups of countries.

This unique position of agricultural and food production is often intensified by the impact of international trade in agricultural products.

The Czechoslovak foreign trade in agricultural products also has a number of unique features--in comparison with other groups of exported and imported goods--and taking them into consideration is one of the necessary conditions for achieving an optimum long-range development of the participation of our agricultural-food complex in the international division of labor.

The position of agricultural products in the Czechoslovak foreign trade can be described as amounting to roughly a 4 percent share of the total export and about an 11 percent share of the total import during recent years. In conformity with the developments on the worldwide scale, the share of foodstuffs and agricultural products in the total turnover is decreasing. Nonetheless, during the initial 3 years of the Seventh 5-Year Plan the average turnover was 230 percent higher than in 1960.

Table 1. Czechoslovak Foreign Trade in Agricultural Products (in million Kcs fco)

Year	Value of Export	Index	Value of Import	Index	Value of balance in mil Kcs fco	Index
1960	943	100	4,158	100	-3,161	100
1970	1,209	128	6,071	146	-8,463	154
1980	3,876	411	12,914	311	-9,038	286
1981	3,790	402	12,523	301	-8,733	276
1982	3,879	411	13,115	315	-9,242	292
1983	3,461	367	11,758	283	-8,297	262

Definition by items in CEMA classification

8--foodstuffs
7--raw materials for food processing
6--livestock on the hoof
58--fodder, concentrated and in bulk
55--seeds and seedlings
59, 102--artificial gut (cutisin and viscose gut)
510--plant fibers
511--wool
530--raw materials for tanning and leather
56--ether oils, exotic resins, medicinal and technical healthcare raw materials (of plant origin)
57--fats and oils for technical purposes (of animal and plant origin)
590--bristles, animal hair and other raw materials of animal origin

Note: A passive balance, with regard to the proportions of imports and exports, reflected, in those years when prices of agricultural products were rising, this fact even when the physical volume of import and export was changed significantly.

A positive feature of the long range development is a faster growth of exports in comparison with the growth of imports, resulting in a higher defrayal of imports by exports. While during the Fifth 5-Year Plan such defrayal amounted to 20 percent, during the initial 3 years of the Seventh 5-Year Plan it reached 30 percent. The dynamic growth of agricultural production and food production, which is manifest in the substantially increased degree of self-sufficiency of Czechoslovakia in agricultural production of the temperate zone, is not, however, fully reflected by a decline of the deficit balance in foreign trade in this branch. This is the result of certain structural changes in imports and exports. The deficit balance, the reduction of which is one of the basic goals of our agricultural complex (ZPoK), has actually been stagnating for the last several years. In comparison with 1970, it has been 80 percent higher during the initial 3 years of the Seventh 5-Year Plan.

On the whole, one can characterize the development of foreign trade in agricultural products and foodstuffs as permanently passive, with long range higher dynamics of exports as compared to imports, while during the last 5 years there has been a visible stagnation in the growth of foreign trade balance in this sector, with the volume of the passive balance remaining unchanged overall.

Considering the fact that in the total value of imports of the Czechoslovak agricultural-food complex are included also non-competetive products and agricultural raw materials of non-food nature--and their share has been increasing significantly--the quantified degree of defrayal of imports by exports and the passive balance cannot be considered to be indicative of the self-sufficiency in the basic kinds of foods. Were the quantification made only for products of the temperate zone, the degree of defrayal of imports by exports during the last several years would amount to roughly 49-55 percent.

Non-essential categories of goods in foreign trade are not altogether appropriate for quantifying groups of products of the temperate zone and non-competitive products, or rather to define "basic foodstuffs." Similarly, a methodical delimitation of products of the agricultural-food complex does not enable us to sufficiently extrapolate the proper foods and alimentary raw materials out of the total production of the branches, or its foreign trade. To explain the development and changes in the composition of Czechoslovak imports and exports, or the disparity between the growth in self-sufficiency and an inadequate decline of the foreign trade deficit in agricultural products, one can point to the typical changes in the product mix in imports and exports.

It is obvious that typical for the product mix of imports of foodstuffs and food raw materials is the decline of the share of basic food commodities, i.e., grains, meat, oil plants and oils, and milk products (the import of those fell between 1970 and 1982 to 6 percent), while on the other hand the share of non-competitive items rose considerably, comprising mostly fodder --such as oily groats, oil-cakes, or fishmeal--coffee, cocoa, tea, and fruits and vegetables--specifically citrus fruit.

Table 2. Development of the Product Mix of Agricultural Imports (shares of products groups in values fco in the total value of imports of the Czechoslovak agricultural complex in percent)

Group	1960	1965	1970	1979	1980	1981	1982	1983
Grains	27.1	20.4	16.0	15.4	15.3	7.9	9.6	6.3
Meat and fattened cattle (1)	11.6	6.8	9.9	3.1	3.5	2.6	2.7	6.3
Fodder (2)	1.3	5.7	3.5	8.3	10.8	12.6	9.4	10.0
Oil seeds (3)	10.9	10.0	8.2	5.0	2.4	3.1	5.0	4.5
Fruits and vegetables (4)	2.1	4.4	5.0	14.7	15.5	18.0	16.7	15.7
Coffee, cocoa, tea	2.7	2.7	4.8	7.5	7.4	5.9	5.2	5.9
Total share of above mentioned groups	55.7	50.0	47.4	54.0	54.9	50.1	48.6	45.9

Explanatory notes:

(1)--sub-groups 719, i.e., fattened cattle on the hoof and sub-group 800, i.e., meat and canned meats, smoked meat products, killed poultry.
(2)--group 58, i.e., concentrated and bulk fodder
(3)--sub-groups 720, oil seeds and fruits and sub-group 841, edible vegetable oils
(4)--sub-group 83, fruits, vegetables, berries and other fruits.

The implementation of nutritional policy in Czechoslovakia, which rests among other things on the improvement of the composition of nutrition, where the weak link is the excessive caloric intake and an insufficient provision of needed vitamin C, led to an improvement in supplying the domestic market with fruits and vegetables, also by means of imports. The low level of self-sufficiency in fruits and vegetables became apparent in the composition of exports of this branch by a marked increase of the share of this group, the change having been caused by higher import prices. At the beginning of the Seventh 5-Year Plan the physical volume of imports of tropical fruits was five times that of 1960, but the average price per ton was more than triple. Fruits and vegetables became the largest group of imports of all the agricultural foreign trade.

There have been however, other changes in the structure of imports, and they are the reason for the insufficient reduction of the deficit balance and to a certain degree obscure the positive results achieved in the growth of self-sufficiency in basic kinds of foods. They concern primarily the increase in the value of imported agricultural non-food commodities, mostly wool, plant fibers, raw materials for tanning and leather. In the composition of imports of the branch in 1983, wool accounted for 5.6 percent, raw materials for tanning and leather 6.7 percent, and plant fibers for as much as 13.8 percent of the total value. This high percentage is the result of a significant increase of import prices.

Whereas, then, during the Fourth 5-Year Plan the determining import commodities of the Czechoslovak agricultural complex were grains, meat and meat products, an oil seeds, in the initial years of the Seventh 5-Year Plan the focus of imports of the branch has been in fruits and vegetables, plant fibers, raw materials for tanning and leather, and albuminous fodder. The increase in self-sufficiency in agricultural products of the temperate zone is, on the other hand, reflected in a continuing decline of some previously dominant import groups, some of which have even become at the present time viable items of the branch export. The fulfillment of the pivotal task of our agricultural complex, decreed by the 15th and the 16th Congress of the Czechoslovak Communist Party, namely achieving self-sufficiency in the production of grains and improving self-sufficiency in the basic kinds of foods, is therefore significantly reflected in the product mix of both imports and exports, while its impact on passive foreign trade is, from the viewpoint of the total concept of our external relations, positive, the situation in the active foreign trade being by no means quite as clear-cut. The changes in the composition of agricultural exports are basically the result of two causes. The first one, closely connected with the growth of self-sufficiency, lies in the rapid development of domestic animal production, accompanied by parallel growth in, and modernization of appropriate capacities of, the food processing industry; also lead time in animal over plant production, resulting in overstocks of animal products that indicate cutbacks in production. The other lies in the reduction of export activity in the so-called traditional export commodities, overwhelmingly those of plant origin, as a result of markedly slower modernization and an inadequate expansion of the capacities of corresponding export branches of the food industry, resulting from a slower rate of growth of labor productivity not only in the area of raw materials of plant origin, but also in the final processing branches. The outcome of these parallel trends then is a change in the export product mix of our agricultural complex, the rationality of which is debatable.

Table 3. Development of the Product Mix of Czechoslovak Agricultural Exports (shares of the product groups in fco values in the total value of imports of the Czechoslovak agricultural-food complex in percent)

Group	1960	1965	1970	1979	1980	1981	1982	1983
Meat (1)	5.0	11.5	11.2	11.8	11.3	16.3	18.7	14.6
Sugar	21.4	19.4	15.0	10.3	23.6	11.6	4.9	5.4
Beer	4.3	2.9	6.5	12.2	9.6	11.5	11.3	12.2
Malt	13.6	13.3	13.0	9.1	9.4	8.2	8.0	8.2
Fruit and Vegetables (2)	3.0	5.7	7.6	7.3	7.2	8.5	5.4	7.3
Dairy products (3)	1.9	2.0	4.1	7.0	5.5	7.3	7.0	9.1
Hops	5.1	7.3	8.3	7.0	6.3	5.0	6.7	7.1

Explanatory notes:

(1)--sub-group 800 of CEMA classification, meat, meat products, smoked meat products and killed poultry
(2)--group 83, fruits, vegetables, berries and other fruits
(3)--sub-group 802, milk products exclusive of butter

In the 1960's the share of traditional key commodities, that is raw brewery materials, beer and sugar, represented 45 percent of Czechoslovak agricultural exports, in the Fourth and Fifth 5-Year Plans still roughly 43 percent, but at the beginning of the Seventh 5-Year Plan not quite 33 percent. On the other hand, dairy products and meat (in the 1960-1970 period the net-import group) have been used in the Czechoslovak exports of the agricultural complex at the beginning of the period up to about 7 percent, in the 1970's already up to 15 percent, and in the Seventh 5-Year Plan just these two groups of animal products amounted to about 25 percent of the total export. All animal products (including butter, eggs, fattened cattle, etc.) represented more than 38 percent of the Czechoslovak exports of this branch in 1983. At the same time, their export has been directed mostly to developed non-socialist countries. In the total active foreign trade with these countries the share of animal products in the first 3 years of the Seventh 5-Year Plan has been more than 48 percent.

These trends in the changing of the composition of exports cannot be considered desirable, especially because they are having a negative impact on the overall economic profitability of the foreign trade of the branch, and are weakening the specialized profile of the participation of the Czechoslovak agricultural complex in the international division of labor. Animal products, which are part of our export assets, are produced with the help of fodder which we import, and the greatest part of the imported fodder we use comes from the area of non-socialist countries. Even though we have been successful in cutting the share of imported fodder per unit of animal production, the encumbrance of our animal production by imported raw materials has been considerably higher than in the case of the traditional export assets of plant origin. More than that, our animal production, in comparison with plant production, is less effective in the area of agricultural production according to the standards of the developed countries. Studies done during the past 6 years, with the aim of expressing labor productivity in individual branches by means of assumed world prices, proceeding, similarly as other analyses, from price relations of domestic producer prices, evince the considerably higher differences in labor productivity in comparison with the developed countries in animal production and lesser difference in plant production. (Footnote 1)

And finally, indicators of economic effectiveness in the long-range average also confirm the lower profitability of the Czechoslovak exports of most animal products in comparison with traditional plant products. The specific problem of the absolute growth of our export of animal products is also its territorial structure and absorption of its products into purchasing markets resulting therefrom.

The weakening of the specialized profile of our agricultural exports as a consequence of the above mentioned trends, is evident not only within the framework of our participation in CEMA, but also within the Czechoslovak agricultural complex itself. Branches which have been oriented particularly toward exports show a weakening in that direction and branches oriented in the past almost exclusively to the domestic market are tending toward exports.

Footnote 1) The coefficients of the relationship between world assumed prices with the purchase prices of Czechoslovak plant and animal production, used for a schematic illustration of the comparison of the level of labor productivity, were in the case of plant production in 1977 0.6514 up to 0.7386, while in the case of animal production they reached the value of 0.4428 up to 0.5263. A lower coefficient signals a greater difference between world assumed prices and Czechoslovak purchase prices, or wholesale prices. (Tucek, P.: Relations of world assumed prices and purchase prices in animal and plant production in 1977-1982, established with the assistance of principal representatives of CSR agricultural production. Study of VUSPR, Bratislava, 1984).

Table No 4. Changes in the Share of Exports in Total Czechoslovak Production of Selected Commodities (in percent)

Commodity	1968-1970	1971-1975	1976-1980	1981-1982
Refined sugar	31.3	26.6	23.8	20.1
Malt	43.8	40.9	40.2	38.3
Hops	57.8	63.3	64.0	56.3
Beer	4.4	5.6	9.3	8.9
Meat and Meat Products	2.2	1.7	1.9	3.8
Dairy Products	2.2	2.6	4.8	5.4

These changes also bring about consequences in the area of productions, planning, and investment activities. Through the increase in the export of animal products, which is oriented predominantly toward the developed non-socialist countries in Europe, we are further increasing the volume of deliveries of CEMA member countries to that market, which, in the given commodities, is and undoubtedly will be overextended. Even though our share of exports of meat and meat products to the countries in question is thus far not significant, this trend should not be considered as merely conjectural in the long run.

Table No 5. Share of Meat and Fattened Cattle in the Total Agricultural Import by Selected Countries of the European CEMA Countries (Percent of value in dollars)

Importing countries	1976-78	1979-81	1980	1981	1982
a) share of import from European CEMA countries including USSR					
German Federal Republic	27.0	36.9	32.4	48.0	49.5
France	39.3	28.2	36.3	28.6	49.5
Italy	68.6	57.7	75.0	50.3	55.1
Great Britain	25.6	15.5	18.5	10.7	10.5
b) share of import from European CEMA countries excluding USSR					
German Federal Republic	33.7	44.7	39.2	59.3	61.3
France	66.5	49.5	63.7	53.7	40.0
Italy	80.1	78.2	84.8	64.0	65.1
Great Britain	46.0	27.3	30.4	21.8	20.2

Le Commerce Europeen Des Produits Agricoles, Economic Commission for Europe, No ECE/AGRI 77.

The high share of a single commodity groups--meat and fattened cattle--in the transfer of goods of agricultural type from the European CEMA countries to

West European countries points out the inadequate diversification of agricultural exports and indicates ensuing risks. An interesting aspect of this specialization is the fact that in most countries of Western Europe plant products predominate in their own agricultural exports. From a certain point of view, export of animal products could be considered economically desirable, inasmuch as they have a higher finalization with a higher added value in comparison with plant products. Most of the West European countries nevertheless assign a lesser share to animal products in the composition of their agricultural exports, even countries with a high level of livestock breeding and state of the art parameters in this type of production, as well as countries with a high degree of self-sufficiency in animal production. As an example one can cite the German Federal Republic, with a 42.5 percent share of animal products in its total agricultural export, Belgium--37.0 percent, France--30.2 percent, the Netherlands--43.2 percent, and Great Britain--merely 28.9 percent in 1981. Even if the generally followed trends, that is to export final products having a higher share of domestic labor. lead under optimum conditions to a more effective foreign trade, one cannot universally apply this tendency also to all products of an agricultural nature. In certain instances, products with a higher degree of processing tend to accumulate ex price instruments of defrayal (various subsidies), which happens comparatively often in practically all the developed countries. From the point of view of the exporting country, then, the export of agricultural raw materials and semi-finished products could be more advantageous, considering the lower share of interventions, grants, and other government ex-cost instruments expended on them. Obviously, what concerns us here is the specific approach of individual countries toward the financing of agriculture, or of the food processing industry, and the level of attainable prices. Despite that, it is also necessary to take this characteristic feature of agricultural production and export into consideration when formulating the concept of the product mix of our foreign trade in agriculture.

The question of the product mix of our exports is closely tied to the economic effectiveness of the integration of the agricultural-food complex into the international division of labor. The economic profitability of the export of food and agricultural products is connected directly on one hand with the extent of the differences between the development of costs and the development of prices, that is to say, with the degree of governmental influence on the economic procedures in the sphere of food production in countries which determine through their participation the situation in international markets, and on the other hand with comparable specific features of the agricultural-food complex in our national economy.

Not considering the demonstrable fact, that the populations in tens of developing countries are starving, that on the worldwide scale there is a long-term shortage of the basic kinds of foods, and that from the viewpoint of insufficient supplies in a number of countries the theoretical potential for marketing exportable agricultural goods is growing, economically advantageous marketing of determining basic agricultural commodities is increasingly becoming a problem for most of the exporting countries. The reasons for this trend, which has been growing stronger lately, rest mostly in the following factors:

--a number of formerly importing countries are striving to increase self-sufficiency in basic nutritional categories. At the same time, for strategic reasons they are energetically pursuing a build-up of their own agriculture and food processing industries, even when the costs of their domestic production exceed several times those of the potential costs of corresponding import. To this category belong primarily many countries of the Middle and Near East, North African countries and important exporters of crude oil, but also some countries in South America;

--the self-sufficiency of countries in Western Europe is rising dramatically, they are increasingly more active as exporters of agricultural and food products. In certain non-traditional commodities, the self-sufficiency of Far Eastern countries is also on the rise. The largest importing countries are emphasizing priority development of their domestic agricultural production, and the results, even at the cost of a considerable burdening of state budgets, show up not only as restrictions of imports, but often as exports of surpluses of basic agricultural products;

--growth of self-sufficiency is being very vigorously pursued in socialist countries, particularly in CEMA member countries. Exports show parallel increases, not only in the CEMA framework, but also to the markets of developed non-socialist countries and developing countries;

--stagnating and falling prices on the international markets of certain important commodities, caused by concurrent good harvests and small increases in consumption resulting from economic crises in non-socialist countries, and consequent losses in imports, are being compensated for by some agricultural countries increasing production and coincidentally increasing their export supplies, by which they further compound the weakening of prices (sugar, grains);

--the ineffectiveness and repeated break-downs of certain measures on the worldwide scale to regulate production or exports (wine, sugar, grains, hops);

--high indebtedness of a number of importing countries, particularly developing ones, which leads to an inability to pay, and therefore to a restriction of imports.

Among the mentioned circumstances, the one that stands out is the nature of agricultural production, given its biological nature and the limitation of structural changes, very limited possibilities for improvements, above-average costs of storage, climatically determined range of products and other circumstances restricting the flexibility of production and ability to adapt more quickly to external circumstances, and thus also to the situation on the international markets.

The focus of the problem of the profitability of exports or agricultural products lies nevertheless in the disparity of prices on the international markets, the domestic prices structures, and the average worldwide or regional costs of agricultural or food processing production. Various forms of support for agriculture and food processing out of state budgets, interventions, grants, and other forms of subsidies given in individual countries to agriculture at various stages of the vertical food processing production ladder--from pre-production stages up to end products for the foreign trade--make it difficult to map out and identify the composition of costs and other economic categories necessary for comparison and consequent decisions. The agricultural policies in most of the developed and in many developing countries, motivated by social, political, ecological, and other considerations, lead to the creation of more or less artificial price levels in the production of food, and funds provided out of state budgets to support exports keep distorting to a constantly greater degree the natural reflection of costs in prices on the international market. This complicates the possibility of achieving comparable advantages on the basis of lower production costs in comparison with those on the worldwide scale.

The nature of agricultural production, the dependency of its volume on weather, socio-political risks of a more drastic economic interference in agriculture, and above mentioned endeavors for self-sufficiency result, among other things, in over-production, often produced with obviously higher costs than the average regional costs for a given commodity, which is then--because that is practically the only way to make use of it--exported on the basis of a proportionately high government subsidy.

The consequence of the cumulative effect of the above mentioned, as well as other production, price, market and political factors, is the fact that prices of agricultural commodities on the international market do not reflect either in the short run, or in the long run, the level of the average costs of a given production, and therefore cannot be an objective criterion of effectiveness in the international context. One can cite several examples.

Sugar

In 1984, price of sugar on the international market fell to a level which did not equal the cost of its production in any of the producing countries. Considering the fact that for many of the producing and exporting countries of cane sugar this commodity is the only, or the basic, agricultural staple, and a crucial part of their income from foreign trade comes from sugar, some of them reacted to the situation by taking measures to increase production. Diversification in countries which produce beet sugar is very difficult, given the system of government regulation of prices and the over-production of many other, alternative agricultural products in developed countries. In August 1984, for example, the EEC granted a subsidy of approximately $350 per ton of exported sugar, in a specific case for the export of roughly 50 thousand tons of refined sugar. To compare--the concurrent LPD (London daily price for white sugar) was $143.5 per ton. Despite this situation, which, because of its extreme nature obviously cannot continue for long--one cannot expect that most of the producing countries will show a stronger inclination to cut back on production.

Grains

In 1983 average subsidies in EEC for export of wheat were $50 per ton, in 1982 as much as $80 per ton. In the current season the supplies of grain in the Community are 27 percent higher than the expected demand; the supplies of wheat are 45 percent higher. The Chinese People's Republic has entered the grain market as an exporter, so has India. China is exporting corn at prices which are 10-15 percent lower than prices of corn from the U.S. Austria, which in the middle of the 1960's was still importing almost one million tons of grain yearly, during the past 6 years exported almost 2.5 million tons of grain. In 1984, Austrian export was estimated at 0.9 million ton. A subsidy of 990 million schillings was used for the export of 750,000 tons from last year's harvest, half of it coming from the state budget. The total subsidy for grain export amounted to about 1.1 billion schillings. Sweden is exporting grains--wheat and oats at prices 400 Swedish kroner per ton lower than the domestic price paid to farmers. Even though the domestic prices paid to producers in the U.S. are relatively closest to world prices, the government is subsidizing the export. According to U.S. data, the federal programs for building and maintaining irrigation systems and ensuring their operation, and for erosion prevention, amount to as much as several billion dollars each year.

In specialized publications one can find data about expeditures out of the EEC budget for storing agricultural surplus, which are reaching astronomical figures. From time to time the reserves are sold off, or exported, at symbolic price which do not cover by any means the cost of buying the stored products. In 1984, for example, butter was exported, bought from trigger stockpiles by a special grant of 330 ECU/t; later this subsidy was raised to 345 ECU/t. This increase was of course in addition to the current rate of export subsidies for butter exported to third world countries, which, depending on the amount of fat in the butter, amounts to 940-1.810 ECU/t. Since November, exporters of butter have been buying butter from trigger stockpiles for export to third world countries with a discount of 1.415 ECU from the trigger price of 3,197 ECU/t. Even though this concerned butter from stockpiles (6 months old), it is obvious what the loss amounts to from such transactions, which are by no means isolated occurrences. Similar operations in foreign trade have been noted in the past also in the case of other commodities (poultry, eggs, dried milk, meat, etc).

The theoretical level of the economic effectiveness of exports of agricultural products in the last several years can be deduced approximately from the relationship of domestic prices paid to agricultural producers for basic agricultural products, and prices in foreign trade, or prices in basic markets, average import and export prices, or world prices. Despite the fact, that with the exception of the Hungarian People's Republic we do not have at our disposal data on the effectiveness of agricultural exports, the hypothetically arrived at values of relations between domestic producer prices and prices in foreign trade prove the high probability of economic unprofitability of actually realized or potentially realizeable exports of major agricultural products of the temperate zone in most European non-socialist countries.

Table 6. Comparison of World Prices of Wheat and Corn with Prices Paid to Farmers in EEC and Austria
(Yearly averages in dollars per 1.000 kg)

Year	World prices*		Prices in EEC**		Prices in Austria**	
	wheat	corn	wheat	corn	wheat	corn
1977	105	98	172	177	186	185
1978	131	105	200	202	214	212

Identical conclusions can be made by comparing indexes of domestic producer prices with prices of corresponding commodities on the international market. (Prices paid to agricultural producers increase even when there are declines in prices on basic markets, or world prices).

From the data on average export prices and average purchase prices in individual countries one can deduce, with a greater or lesser degree of inaccuracy, also the hypothetical value of the relationship between the domestic prices and prices realized in export, thus a certain analogue of a differential indicator. Calculations have been made purposely for comparable agriculturally developed West European countries, costs which are charged against the product in the phase between the place of sale to farmers and the place designated by the parity of price not being taken into consideration. For example, the hypothetical values of the mentioned simplified differential indicator for the export of potatoes in 1982 would be 88 in Denmark, 82 in the German Federal Republic, 81 in Belgium, 67 in the Netherlands and Austria, and only 43 in Italy. The relationship of the price paid to producers and the potentially achievable export price, deduced from the price of the basic market, or rather similar transactions of goods of comparable quality, the roughly corresponding differential indicator would be in the case of export of feed barley from Denmark 50, from France 58, and from the German Federal Republic 43. By comparing the average purchase price of eggs in the German Federal Rebublic in 1981 and 1982 with the average import price of eggs to the German Federal Republic (exclusive of duty), we can ascertain a corresponding coefficient for the year 1981 in the amount of 84 and for 1982 in the amount of 79. Prices paid to farmers for 100 kg of wheat of comparable quality or lesser quality in West European countries in

1981 moved in the area between $20-27, in 1982 between $19-25. Parallel export prices of U.S. and Canadian wheat (of higher quality) were at the level of $18.2 per 100 kg, $17.05 per 100 kg, in 1982. Average import prices of wheat (Unit Values) to individual West European countries were in some countries even lower than the prices paid to their own producers. Comparable relationships can be found in the case of corn and other commodities. The closest relationship of prices paid to producers and export prices, or prices paid on the international market, exists in the U.S. and Canada. But in these countries, too, in some years the yearly average price paid to farmers is higher than the yearly average of export prices of identical goods. With regard to the fact, that from the moment of purchase up to the place determined by the parity of price in the foreign trade, increases in costs occur, it is obvious that prices paid to producers are in the majority of cases higher than prices on the international markets. Even though this discussion of price relations is hypothetical and only illustrative, it is possible, looking also at other similar findings, to deduce that current export of basic agricultural commodities from developed non-socialist countries can hardly be economically profitable for the exporting countries. At the same time we need to add that a number of developed West European countries show prices paid to producers up to 200 percent higher than the West European average. Where we are talking about importing territories, these data were not taken into consideration (for example, Switzerland).

The increasing participation of governments in balancing the cost of production of agricultural products and food, without regard to what other subsidies are granted to agriculture from other sources, is an almost universal phenomenon, not only in the developed countries but also in a number of the developing countries. To quantify the share of subsidies out of state budgets that go into agricultural production is, because of the considerable variety of forms they take, almost out of the question. Nonetheless, it is obvious that the price in the basic market, the world price, or other prices in foreign trade, do not express the comparable costs for a given commodity on a worldwide or regional scale. Political, social, and sometimes also ecological factors, linked to agriculture and production of basic foods, constitute a priority for many countries. A relative overproduction of food stuffs and agricultural products in developed countries leads to a worsening of conditions for selling on corresponding markets, for strengthening the competitive struggle, and shows up logically enough in the area of prices. The mentioned trend is manifest especially in the case of products of the temperate zone, therefore products of the developed countries. A number of products of the tropical and subtropical agriculture understandably do not fall into this approximate category and their supply on the world market lags behind the demand, and thus their prices keep rising. Developed countries are vigorously increasing their exports of agricultural products. Whereas the worldwide export of all agricultural products including fish and forestry products in the period of 1977/79 came to $228 billion on the average, the export of developing countries was $70 billion of that amount, but the export of developed countries was $158 billion. In 1981 the world export of agricultural products reached a total of $299 billion, of that amount the export of developed countries came to $215 billion, but that of the developing countries was only $84 billion. In the period of 1970/81 the average yearly increase of the physical volume of exported agricultural products of developed countries was 5.6 percent a year, of the developing countries only 1.7 percent.

Even though the share of the Czechoslovak export of agricultural products is insignificant in the context of the mentioned trends, it still holds an irreplaceable position in our external economic relations. Paying attention to worldwide developments or regional trends is one of the key conditions for further rational growth. Assessing the possibilities which arise from cooperation within the CEMA framework is not possible without taking into account worldwide developments. The integrated market of the socialist countries is, because of certain specifics, the market of the developed countries, and is not without influence on the above mentioned trends, and vice versa.

Considering the nature of agricultural production in the developed countries, primarily in Europe, there is an expected overproduction of the main products of the temperate zone by the year 2000, which nevertheless will not have a fundamental impact on the worldwide shortage of food, considering the fact that developing countries will be able to solve their food problems only by improving their own agriculture. The same conclusions have been reached also by the European Economic Commission of the United Nations in their studies in previous years. Certain incentives for the Czechoslovak foreign trade in agricultural products arise from these conclusions, which will have to be taken into consideration and incorporated into the planned production of export assets. The problem is the more urgent the faster the self-sufficiency in basic agricultural products grows and creates potential production surpluses, which in part affect exports.

It appears that the causes of a low economic effectiveness of our exports of agricultural production, or rather in the difference between those costs and average regional costs, but for the most part in the unconformable base of prices in the basic markets which, because of the growth in the volume of production and the stagnation in sales, is often lower than the average regional costs of a given production. These observations could, considering the expected continuation of these trends, lead to unreasonable restrictions of our agricultural exports. The Czechoslovak agricultural export is nonetheless the source of extraordinary advantages, is a profitable segment of our foreign trade contacts with certain important areas, and is for a number of reasons irreplaceable.

Its long-term direction, leading to a growth of economic profitability, will answer the needs of our national economy to the extent to which we will succeed in optimalizing its product mix with an appropriate lead-time. The improvement of the composition of the branch export will first of all require that in the case of some commodities we give up in part some positions which today are hard to defend and which are rooted in past traditions. The fundamental and wholly deciding precondition for increasing the competitiveness of Czechoslovak agricultural products on international markets is and will be the closest cooperation with individual sectors of the agricultural complexes of CEMA member countries, the closest coordination of the planning and commercial activities with sister socialist countries. Only this road can lead to a progressive long-range cooperation in the framework of European agriculture, to the abolition of unrealistic duplicated activities, and a step by step removal of obstructions in the international agricultural trade. The character and extent of the Czechoslovak agricultural complex determine to a certain degree the possibilities for our effective participation in the international division of labor in this sphere. It is obvious that the shifting of the focus of our export activities should be directed to brand products and specialties, to export of agricultural products with a high level of improvements, such as improved seeds and seedlings, specialized food products of the highest quality, etc.

The effort to increase the economic effectiveness of the agricultural exports will demand primarily the selection of profitable export branches and giving them preferable investment treatment, and further it will require re-evaluating the creation of export assets on the basis of improvisationally produced surpluses. Certain measures in this respect have already been taken.

MINISTER VIEWS CHANGED NEED TO IMPROVE INDUSTRIAL EFFICIENCY

Prague HOSPODARSKE NOVINY in Czech No 1, 1986 pp 1, 7

[Article by Eng Ladislav Gerle, candidate of sciences, deputy premier of the CSSR: "Through Changes Toward Efficiency"]

[Text] The Seventh 5-Year Plan has come to an end. Of the results known thus far we can state that the basic line of economic and social policy, which had been adopted by the 16th Congress of the CPCZ, and which is anchored in the law pertaining to the Seventh 5-Year Plan, will, essentially, be adhered to.

At the 16th congress a fundamental task was assigned to the engineering-metallurgical complex--to assure the modernization of the production-technological base, to master export tasks and deliveries for the domestic market on a qualitatively higher level. The congress assigned high rates of development to the engineering industry and particularly to the electrotechnical industry. In so doing, it placed great emphasis on the growth of the technical-economic level of production, on shortening the innovative cycle, and on speeding up scientific and technical development. In planning to halt the quantitative growth of the metallurgical industry, the congress turned its attention particularly to the qualitative aspects of products.

Better and Worse Results

The results of the Seventh 5-Year Plan confirmed that the engineering-metallurgical complex, which accounts for 43 percent of overall industrial production, generally successfully met the demanding tasks levied upon it. However, it is a fact that the results could have been better had all possibilities of technical development, organization and management, modernization and reconstruction been utilized and, last but not least, had the quality of production been increased.

High increments in production were achieved particularly in the areas of electronics and microelectronics (microelectronic circuits, instruments for automated regulation, telecommunications facilities, machines for data processing) and by some areas of consumer goods (particularly color television sets). Above-average development rates were recorded by areas supporting the development of fuel extraction, energy, and hydraulic power. Areas whose products possess prerequisites for exports to nonsocialist countries also developed more rapidly. On the other hand, development of areas experiencing intensive material use, particularly of imported materials, as well as areas which experienced difficulties with sales abroad, were experiencing slower development.

A number of successful machines and installations were developed, for example, the technological installations for VVER-440 nuclear power plants and surface quarrying technology, conveyor belt equipment, electric and combustion locomotives, trolleybuses, steam and water turbines, metal-forming and metal-cutting machines with computer numerical controls, cargo trucks, construction machinery, agricultural machinery and tractors, printing machines, textile machines, and installations for the chemical industry. A number of new types of consumer goods were introduced.

The expansion of areas important to the national economy was supported by seven state goal-oriented programs. Production in related areas increased, in comparison with the previous 5-year plan, by 178 percent. Last year, its share in total engineering production was 8.5 percent.

In metallurgy, while the production of pig iron stagnated, emphasis was placed on intensifying the production of steel and rolled materials, which led to improving the structure of metallurgical products, as well as leading to the growth of their utility characteristics. Steel produced by the oxygen converter method accounted for 40.5 percent (steel produced by the oxygen process alone accounted for more than 70 percent), electric steel accounted for 14 percent, and continuously cast steel to 8 percent of total steel production. The slowdown in the progress made by modern metallurgical technologies, particularly the low share accounted for by the continuous casting of steel, exerted an unfavorable influence upon the further increasing of the utility characteristics of metallurgical material and, thus, also adversely influenced the desirable lowering of the quantity of produced metals. We were not fully successful, either through domestic production or through imports, to assure the actual development of the engineering industry. In particular, there is a shortage of technical means to facilitate the transition to the automation of processes and the employment of modern technologies which would make it possible to increase capacity and lower the labor-intensive nature of engineering production.

Overall tasks in deliveries for investments and domestic trade were exceeded. During the course of the Seventh 5-Year Plan, the engineering industry increased its share in overall Czechoslovak exports, particularly with respect to the socialist countries. However, it was neither possible to attain the anticipated degree of efficiency nor the expected volume with respect to exports to nonsocialist countries. The objective influence exerted by changes in the structure of demand and the limiting measures taken by the governments of capitalist countries are amplified by persisting problems pertaining to the lack of adaptability of Czechoslovak production to buyer requirements from the standpoint of ready delivery, technical level, and assortment. Considerable reserves exist in commercial work and with respect to the essential connection between production and foreign trade.

Targets in decisive economic indicators (adjusted producer costs, profit) were also exceeded. They reflected the fulfillment and the exceeding of stipulated savings in fuels, energy, and materials. Labor productivity also developed in a more favorable vein than had been anticipated by the Seventh 5-Year Plan.

The successful fulfillment of the entire Seventh 5-Year Plan was significantly contributed primarily by the realization of the conclusions of the 10th Session of the Central Committee of the CPCZ with respect to the goals and development of the engineering industry, the electrotechnical industry, and metallurgical industry after the 16th Congress of the CPCZ. However, fulfillment of the stipulated measures indicate that the engineering-metallurgical complex continues to show evidence of some serious problems of a long-term character which exert an unfavorable influence upon meeting the requirements of the national economy, upon the technical level of products, and the efficiency of their production, as well as their export. It is primarily from this viewpoint that the demanding nature of the tasks faced by the metallurgical and engineering complex during the Eighth 5-Year Plan must be judged.

At the 16th Session of the Central Committee of the CPCZ, which was held toward the end of November of last year, the status of work on the Eighth 5-Year Plan for the economic and social development of Czechoslovakia and the plan for 1986 were discussed. The proposed conception is based on the long-term development of our society through the year 2000. Despite the fact that existing considerations are the subject of further research in many directions and searches for optimum solutions, it is clear during the current period that the attainment of the intentions of the Eighth 5-Year Plan will demand a more speedy and more effective mobilization of all reserves.

Orientation Toward Priorities

Over the next 5 years, national income is expected to increase by a minimum of 17 to 19 percent. Its growth must be safeguarded, essentially, on the basis of today's level of fuel, energy, and material resources. The lowering of the share of production consumption to produce the social product is three times greater during the Eighth 5-Year Plan in comparison with the Seventh 5-Year Plan and is expected to assure more than one-third of the increment in the national income. The demanding nature of tasks is reflected primarily in the industry which assures virtually 80 percent of the anticipated increment in the national income.

The engineering-metallurgical complex will continue to make a significant contribution toward attainment of these difficult intentions. Engineering production will rise by more than 30 percent by the year 1990 (from today's Kcs 234 billion to Kcs 306 billion). The fastest growth rate is to be attained by electrotechnical industry production--by more than 62 percent.

In metallurgy the intentions of the Eighth 5-Year Plan are oriented toward maintaining deliveries of metallurgical products for use in the national economy at the 1985 level, while raising their utility parameters. Completely new materials and products will begin to be delivered which are essential to the expansion of progressive engineering and electrotechnological areas and the share of refined steels will be raised.

The development of the engineering-metallurgical complex will be aimed at national economic priorities, specifically the following:

a) increasing exports and their efficiency, particularly to nonsocialist countries. The engineering industry and the electrotechnical industry must support a roughly 30-percent higher formation of foreign exchange resources. This is a very demanding task because the tasks of the Seventh 5-Year Plan were not fulfilled with respect to engineering exports to nonsocialist countries. Extraordinary attention must be devoted to a higher valuation of exports to both territories;

b) further improvement in quality with respect to deliveries made to the domestic market. This will primarily be a question of expanding the assortment and delivery of types of goods in short supply. Special significance attaches to deliveries of high technical and quality levels which are being sought. The engineering industry and the electrotechnical industry must, during the next few years, increase deliveries to the domestic market by virtually 40 percent;

c) the creation of essential technical prerequisites for the further expansion and modernization (reconstruction) of both the production sectors of the complex, as well as of sectors of the other branches of the national economy. Deliveries of capital goods from the engineering industry are to increase by 25 percent in 1990, compared to 1985;

d) the creation of essential prerequisites for the utilization of manufacturing products by domestic and foreign users, primarily through the delivery of required spare parts and after-sale services.

The fulfillment of these tasks must be assured and accompanied by substantial declines in the energy-intensive and materials-intensive nature of the products manufactured. With respect to engineering sectors, the average annual savings in ferrous metals should be about 5 percent, whereas savings in the entire national economy should be 3.5 percent; this should be accompanied by a tightening of the decisive economic plan indicators.

The principal method for attaining the intentions of the Eighth 5-Year Plan must, therefore, become the deepening of intensification in the engineering-metallurgical complex, which was initiated as early as the Seventh 5-Year Plan. This is connected with gradual changes in the structure of production.

The decisive structural changes will be given direction and will be controlled by the state goal-oriented programs. In conjunction with the requirements of the national economy, they will be aimed primarily at nuclear energy, the rationalization of the consumption of fuels, energy, and metals, at selective progressive production processes supporting the expansion of robotics and the automation of technological processes, at the expansion of qualified chemistry, at selected subassembly sectors, and at the problem of electronification. Production in industrial sectors to support these programs is expected to virtually double during the course of the Eighth 5-Year Plan.

In Support of the Innovation of the Assortment

Changes in production will lead to priority development of those production sectors which will make it possible to raise the technical level of products and their efficient sales in foreign markets. Naturally, structural changes in the engineering industry will require changes in the structure of subsupplier branches where, thanks to a higher share of mental work, better efficiency is being achieved than in other industrial sectors.

During the course of the next 5 years, production in the heavy engineering industry is to rise by more than 21 percent. The main tasks are concentrated upon assuring deliveries for capital activities at home and abroad. This will involve primarily deliveries in support of nuclear energy, the reconstruction of conventional power-producing equipment, equipment for the production of heat (the boiler economy), both for industry as well as for the population, the innovation of transport facilities, primarily locomotives, streetcars, trolleybuses, and freight cars. Increased importance also attaches to deliveries for the food processing industry, for the low-volume chemical industry, and for ecological programs. The dynamics of development of production in the heavy engineering industry are also specifically influenced by our participation in joint projects in the USSR (for example, at Krivoy Rog and Yamburg).

With respect to the general engineering industry, it is decisive that, during the Eighth 5-Year Plan, it satisfy the higher demands of modernization of the production-technological base of the national economy and substantially raise the quality of deliveries for the domestic as well as for the foreign market. Important sectors of this industry are on a relatively good technical level. This is also documented by the results of our participation at last year's international engineering expositions at Brno, Hanover, Leipzig, and Plovdiv. A number of our products are comparable to leading products in the world and some continue to hold their leadership levels. In many areas we have captured the current tendencies in world development (for example, with respect to metal-cutting and metal-forming machine tools, textile machines, and leatherworking machines) and we have the prerequisites for further developing these products. On the other hand, there are sectors in which we are not achieving the required results.

It turns out that in order to safeguard the further development of engineering sectors it will be necessary to solve the expansion of the assortment and increases in quality of subassembly elements and the desired application of electronics or microelectronics above all else. Currently, there is virtually no sector in which electronics do not fulfill the function of specific innovation leading to a substantial increase in the technical-economic level and the utility characteristics of its products, where electronics would not lead to more rational and more efficient production processes. Therefore, the growth of production envisaged for general engineering during the Eighth 5-Year Plan of roughly 25 percent will not mean a mere increase in existing trends of development within individual production sectors, but will represent an express change in the structure of their production.

Structural changes within sectors and between sectors will be based, primarily, on progressive and fundamental innovations affecting the total production assortment. This is based on the more express application of the results of technical development, particularly relative to the application of electronics in regulating and control functions pertaining to engineering products, the use of new materials, the introduction of modern technologies, etc.

From these viewpoints, it will be necessary to specifically aim for development, adaptation, and production of new generations of machines and installations which will make possible the express growth of productivity while taking world trends into account with respect to electronification and automation of production processes. This is primarily a question of developing the production of flexible production systems, including the means of active control, interoperational manipulation, control systems, and the utilization of industrial robots and manipulators. A no less important task will be the assurance of modernization pertaining to current key sectors, for example, tractors, automobiles, metal-cutting and metal-forming machine tools, textile machines, printing machines, and leather-working machines.

Above-average development rates will be experienced by industrial robots and manipulators, turboblowers for combustion engines, high-capacity changers and converters, welding machines, container-filling and packaging equipment, excavators, transmissions, printing machines, agricultural machinery and installations, textile machines, hydraulic elements and aggregates. Justified demands are also being placed on the quality and assurance of the desired quantity of deliveries of engineering consumer goods, particularly those that have been modernized and of completely new products.

Support for the Program of Electronification

In the electrotechnical industry the main intentions for development are primarily connected with assuring the program of electronification throughout the national economy, while further strengthening its subassembly character, primarily in relationship to the engineering industry. The intentions are specified particularly in the state goal-oriented program A-07--Development of the Material-Technical Base for Electronification, as well as in goal-oriented program A-08--Development of the Application of Electronics in Selected Sectors of the National Economy. The goal is to speed up development of the electrotechnical industry during the Eighth 5-Year Plan and to thus create the material-technical conditions for the broader application of electrotechnics and electronics in production and utilization.

The anticipated development of national economic needs demands that certain changes be made in the structure of the volume of production of individual sectors in the electrotechnical industry. The greatest growth in production during the Eighth 5-Year Plan will be in the areas producing components (an increase of about 136 percent) and measuring equipment (an increase of about 110 percent). A lower rate of development will be experienced by areas of heavy current electrotechnics (an increase of about 36 percent). A high rate of development of production, primarily for use in the electrotechnical industry itself, will be experienced by single-purpose machines and installations. The attainment of the anticipated rates of production growth are connected with the gradual formation of conditions for the modernization and expansion of technological capacities and increases in the volume of material inputs.

Substantive goals of the electrotechnical industry are characterized by significant innovative changes. In the component-manufacturing base technology for the production of complex integrated circuits will be adopted. New technology involved in the surface mounting of components to area contacts, whose contribution will primarily be a higher degree of reliability and a reduction of product dimensions, will be introduced.

In automation and computer equipment, production of systems for automating production control and technological processes will be expanded. This will involve modernized and increased production of minicomputers, microcomputers, development of the production of sensors, readers, servodrives, and other automation elements.

With respect to measuring equipment, demanding systems such as electron microscopes, X-ray analyzers, spectrometers, etc., will be further developed. With respect to capital electronics, the principal effort will be aimed at the further modernization of television and broadcast transmitters operating by remote control, equipment for assuring satellite transmissions; in telecommunications equipment, the transition toward completely electronic telephone centrals will continue.

With respect to consumer electronics, emphasis will primarily be placed on the modernization of existing instruments to record and reproduce sound and on the development of production and an adequate assortment of television receivers while increasing the degree of digitalization, the level of design, and the level of some special services such as stereophonic sound and receipt of supplemental information involved in color television receivers and improvements in the convenience of operation. In addition, principal attention will be focused on the development of the production of audiovisual equipment, particularly of videocassette recorders and digital compact disk players.

A Lower Share for Metallurgy

The concept for metallurgical production is based on the basic directive calling for reduction of the energy-intensive and materials-intensive nature of national income formation. In 1990 the share of metallurgy in the overall volume of industrial production will decline by more than 10 percent compared to 1985. Even though industrial production will increase, and paricularly engineering production, domestic consumption of metals will not be increased and exports will be accomplished as a result of economically efficient international division of labor. While the overall production of steel will decline, it is anticipated that production in oxygen converters will rise to such an extent that, together with tandem processes, it will approximate 75 percent of production. In this connection, one of the most complicated tasks will be the processing of all occurring metal scrap in steel mills. It is essential to speed up the solution of assigned tasks of scientific-technical development which bear on increasing the throughput of scrap in tandem furnaces and oxygen converters with the assistance of supplemental fuels.

With respect to the production of rolled materials, we are concerned primarily with assuring the necessary assortment at appropriate quality and processing levels, particularly with increasing the growth in refined steels by more than 20 percent. Efforts will also be made to accomplish the rational utilization of new, modern roll trains and the gradual sidelining of obsolete capacities in rolling mills, as well as other metallurgical aggregates. Tube mill capacities will be augmented by the second phase of development at the Tube Mill and Metallurgical Plant at Chomutov to produce thick-walled tubes destined primarily for the engineering industry.

Development of the metallurgy of nonferrous metals is closely connected with the development of programs affecting the engineering and electrotechnical industry. In the metallurgy of nonferrous metals it is expected that domestic raw material resources, including secondary raw materials, will be utilized, it is expected that higher-quality production will be expanded, such as that represented by powder metallurgy, and it is expected that special materials for the electrotechnical and electronics industry will be produced.

The satisfaction of the requirements of industry, not only with respect to quantity, but, primarily, with respect to quality of materials (including new assortments of special materials), requires the speeding up of modernization and the intensification of metallurgical production. This will simultaneously facilitate the lowering of the consumption of metals and energy which is intolerably high today.

Cooperation Will Expand

An essential condition for the engineering-metallurgical complex to play a significant role in making the transition of our economy onto the path of its further intensive development is its broader commitment with respect to the international division of labor involving the CEMA countries, primarily the Soviet Union. A fundamental role in developing economic and scientific-technical cooperation is played by the newly created CEMA Committee for Cooperation in Engineering. Last year this body discussed, among others, the working out of long-term programs for development of specialization and cooperation in the engineering industry through the year 2000. Within the framework of the engineering committee, Czechoslovakia participates in a whole range of work with special-purpose intentions aimed at the automobile industry, power engineering, and health equipment, the sectoral organizations of which are presided over by the following ministers of the Czechoslovak Government: Comrades Pavol Bahyl, Eduard Saul, and Milan Kubat.

At the end of last year, at the level of premiers of governments of the CEMA countries, it was decided to establish the international association entitled INTERROBOT; Czechoslovakia participates in this program both in a directoral capacity as well as with its production capacities. Full use is made of the Research Institute of the Metals Industry in Presov, which fulfills the function of the leading work site involved in the program of robotization in our national economy.

In conjunction with work involved in the joint scientific-technical program of the CEMA countries through the year 2000, the engineering industry and the electrotechnical industry will determine the dynamics which will exist in mutual relations. Even today their share in the international division of labor exceeds 60 percent.

For the period of the Eighth 5-Year Plan, important tasks have been set for the metallurgical-engineering complex which involve increases in the share of high technical-economic-level products. In comparison with the Seventh 5-Year Plan, the increases for the heavy and general engineering industry are to be virtually 5 percent, those for the electrotechnical industry 8.5 percent. Fulfillment of these tasks will demand an accelerated realization of outputs involved in the tasks of the plan of technical development, in completed tasks or tasks which were started during the Seventh 5-Year Plan, as well as an express modernization of production sectors, primarily in the enterprise sphere.

In the system of managing technical development and evaluating the technical-economic level of production, it is necessary to remove selected administrative elements which do not exert sufficient pressure or incenetives to strengthen healthy entrepreneurial functions among producers designed to fulfill the decisive requirements and needs of users. We are dealing with the standing of the enterprise and the economic production unit in the area of technical development, their full responsibility and duty to solve their own prosperity problems, and the competitiveness of their products on the world market through technical development.

Fundamental Modernization Is Essential

The speedup in the development of the engineering-metallurgical complex to enable it to satisfy the requirements of the national economy is not possible without a fundamental solution of the problem of modernizing and reconstructing its production base and the continuous application of modern technology. The pressing need for modernization and reconstruction of the production-technical base is based not only on its growing obsolescence, but primarily on the fact that without modern technologies which are generally introduced throughout the world we would lag behind in the economy of production and would, consequently, be losing out in the international arena. For the present, the labor-intensive nature of basic production is not declining adequately. Metalforming, the production of precision castings, welding processes, and the appropriately connected progressive technologies are being applied in an unsatisfactory manner. The share of modern semiautomated and automated machines continues to be low and, in the past 5-year plan, did not undergo any significant changes. It is, therefore, essential that modern technologies, digitally controlled and computer-controlled equipment be introduced on a far greater scale and that production processes be gradually automated through the utilization of electronification and robotization.

In conjunction with the intentions of capital policies for the Eighth 5-Year Plan, emphasis is being placed on the priority assurance of reconstruction and modernization pertaining to the production base of the engineering-metallurgical complex and the express increase in the share of machines and installations in the overall volume of capital investments.

Even though the plan creates certain prerequisites for the modernization of the production-technical base in the engineering and electrotechnical industries, it will be necessary, in support of their substantial acceleration, to utilize all existing reserves and economic results achieved by enterprises and organizations. This will not be a question of one-time actions, but, rather, a permanent process which will have to involve the system of management through suitable economic levers. Without weakening capital formation and the utilization of national income, it is not possible to acquiesce to the calls, and the frequently justified arguments, of industrial enterprises for additional investments. But why not provide the opportunity for a certain portion of the capital, which is created over and above the economic plan (and thus also arouse interest in exceeding planned targets), to be used for modernizing the production base, along with all its advantages?

A serious problem remains the assurance of technical needs for modernization and reconstruction, as well as new construction. We wish to obtain these means particularly through the following ways:

a) through deliveries of machines and installations from specialized domestic production, which will be at the required technical-economic levels (they will be provided by so-called major engineering industry establishments);

b) through the production of single-purpose machines and installations at the sites of users of the technology, backstopped by modules, components, and parts produced by the engineering and electrotechnical industry;

c) through the medium of the engineering committee (in its jurisdiction, it cares for production technology of the socialist community of states) from CEMA member countries.

Sometimes, a quick solution offers itself through imports from capitalist countries, particularly from the holders of mature technology. Even this solution can be suitably supported with effective economic instruments (the good example of the approach by the State Bank of Czechoslovakia with respect to utilizing credits which return foreign exchange is known from the period of the Seventh 5-Year Plan) and through motivation to obtain funds by exceeding export targets to nonsocialist countries with a higher share of their utilization being assigned to domestic modernization.

The engineering-metallurgical complex faces a significant period which is closely connected with deepening intensification throughout the entire national economy. The demanding nature of the tasks which it faces as a result of the conception of the Eighth 5-Year Plan primarily consists of the fact that they are to be fulfilled concurrently with the progressive solutions of further development affecting the engineering-metallurgical complex. This also results in high demands placed upon every worker and a completely new approach to the fulfillment of planned intentions.

SEWER SYSTEM DETERIORATION HALTED THROUGH RELINING PROCEDURE

East Berlin BAUZEITUNG in German No 11, Nov 85 pp 516-17

[Article by Hans-Dieter Teuber, engineer, Chamber of Technology [KDT], Leipzig, Bernhard Fischer, engineer, Leipzig KDT, Eberhard Fritsche, engineer, Wolfen KDT, Eberhard Steckel, engineer, Wolfen KDT, from the Institute for Construction Engineering and Underground Construction of the Construction Academy of the GDR]

[Text] On an international scale it can be observed that damage to sewer networks is becoming more extensive. This situation is derived in part from the approaching end of the standard useful life of such networks and in part, however, from static, dynamic, thermal, and chemical effects for which the network was not originally designed. The results are leaking connections, cracks in the pipe, corrosion damage and the related undesirable infiltrations or environmentally polluting leakages, the last-cited particularly among waste water pipelines of chemical plants. Efficiency and functional fitness are reduced to an extent which requires either a replacement or a restoration. Since the replacement causes high costs and in the case of in-house pipelines additionally sensitive interruptions to the course of the production, interest is growing in restoring the functional fitness of damaged waste water systems with the aid of economical repair processes once again that require only a minimum of digging up, have an effect with little interference to attached or neighboring production plants, and guarantee a long service life of the repaired network area.

Choice of the Repair Procedure

On the basis of a corresponding assignment a development was carried out in the Institute for Construction Engineering and Underground Construction of the DR Construction Academy in cooperation with the source of the assignment and a potential firm for carrying this out, whose objective was the effective repair of waste water systems in chemical industry. The following aspects were to be considered:

- Because of the relatively frequent change in the variety of products and the changes in production technology and raw materials connected thereto in the chemical plant a variety of waste products and effluents arise unavoidably.

Since these changes are not predictable for such a long time as waste water systems must be used, the use of a high quality repair material with a longer service life is required.

- The repairs are to be undertaken on unpressurized pipelines with a cross section--lower limits of diameter of 150mm--that show leakages in the areas of connections and cracks in the pipe walls, which in fact do not lead to the collapse of the pipeline but which have reduced its carrying capacity. The material to be used for the repairs must as a result contribute to the restoration of the carrying capacity.

- This must involve not only the pipeline bundles but also, as far as necessary, the tunnels in the complex repairs. In this case the carrier construction of the often square or right angle tunnels must continue to be functionally fit.

An almost complete overview of the possible procedures is presented by Teuber in (1) and Maidl, Stein, and Bielecki in (2); a limited number of procedures is reported in (3).

On the basis of the cited premises in the case of the task-related weighing of the processes and materials the decision fell in favor of the relining procedure. In this case a PE-HD pipe cluster ND 3.2 is drawn into the unpressurized pipeline to be repaired, whose cross section is freed of incrustations and deposits by a previous pipe cleaning down to the almost original rated diamater. A significant role is played here with the use of the further developed procedure, and with the inclusion of special tunnel lining of PE-HD /polyethylene-high pressure/lining material it became possible not only as before to repair individual carriers but whole areas of network up to the required minimum rated diameter of 150mm (4, 5, 6).

Application Criteria:

- The relining procedure with PE-HD pipes should be used only then when the aggressiveness of the medium flowing through justifies the use of this high quality intermediate.

- Corresponding to the conditions relating to production and the complex reconstruction plan is to be worked out for the network area of the time a repairs plan with the following objectives:

  . division into repair fields,
  . future use of the pipeline (hydraulic, chemical, and other demands),
  . condition of the pipeline (on the basis of sewer main distant viewing) and of the tunnels,
  . planning the underground construction space which comes into consideration for the selection of the starting and end ditches or end tunnels, respectively,

  - decision on the direction of the repairs (if possible, from the large rated diameter to the smaller),
  - determination of the retractable lengths (20.00m to 50.00m, in special cases larger).

- The firms for this operation must be authorized for such work.

- In the case of welding operations on the thermoplastic materials the official guidelines must be followed.

- The reduction of the open diameter caused by the insertion of the sleeve in the pipe to be repaired must be so little that the pulling through of the drawing attachment of the PE-HD pipe is permitted.

- Feeder lines, that connect with the main to be repaired outside of the tunnels, are to be dug up. The connecting pipe is either:

  - to be shut down or
  - to be shifted to an existing ditch, in which case the old connection site is to be sealed or
  - to be connected on the spot to a newly constructed tunnel.

Effects

With the repair procedure "relining" for sewer mains and the complex technology developed for it--specially for applications in industrial areas with above average effluent loading--it is possible to save on labor for excavation and filling in and to lessen the sensitive interruptions generally connected with repair operations significantly as well as impairing the above ground traffic. Besides the following is achieved:

- man-hours reduction by about 60 percent,

- economy in investment costs in comparison with the replacement by new ceramic pipes with reaction resistant sealing of the pipe joints depending upon pipe diameter and depth,

- reduced heavy manual labor (about 6 kg of PE-HD pipe per meter in place of 70 kg ceramic pipe per meter),

- increase in the operating safety of the pipeline through the elimination of the sleeve connections with their sealing materials sensitive to damage.

A pipeline repaired by means of the relining procedure has practically the same intrinsic value as the original undamaged pipeline. The repaired main in fact shows in comparison with the original a smaller inner diameter; it is nevertheless smoother, less likely to have deposits and thus maintenance friendlier, and it is above all operationally safer.

BRIEFS

POLISH-NICARAGUAN TRADE, SCI-TECH TALKS--On the fourth of this month Vice Premier Manfred Gorywoda, chairman of the Planning Commission, met with the revolutionary commander and Minister of Cooperation with Foreign Countries Henry Ruiza Hernandez of the Republic of Nicaragua. Minister Hernandez is head of the Nicaraguan delegation at the first session of the Polish-Nicaraguan Mixed Commission for Economic Cooperation. The results of bilateral economic relations between Poland and Nicaragua were summed up during the meeting and issues concerning the further development of economic and sci-tech cooperation between the two countries were also discussed. [Text] [Warsaw TRYBUNA LUDU in Polish 5 Feb 86 p 2] /8918

POSSIBLE TRADE WITH JAPAN--Andrzej Wojcik, minister of foreign trade, and Japanese Ambassador Susumu Matsubara met on the 24th of this month to discuss the question of Polish-Japanese economic cooperation. Interest was expressed in increased trade between the two countries, including cooperation in third markets. The potential for participation of Japanese firms in the modernization of certain areas of Polish industry was also discussed. [Text] [Warsaw TRYBUNA LUDU in Polish 25-26 Jan 86 p 8] /8918

ECONOMIC JOURNAL IMPORTANCE STRESSED--On the third of this month Vice Premier M. Gorywoda, chairman of the Planning Commission in the Council of Ministers, met with Z. Gajczyk, director of State Economic Publications, and M. Ostrowski, editor-in-chief of GOSPODARKA PLANOWA. This monthly, which is devoted to the problems of planning and economic development, is commemorating its fortieth anniversary this month. The importance of the development of economic knowledge and planning concepts for the formation of a growth-oriented view of the Polish economy and the continuation of the process of reform of its mechanisms was also taken into account. They also discussed the main directions and forms of the publication's activities. Vice Premier Gorywoda indicated the role that GOSPODARKA PLANOWA could perform in a search for new solutions and in the formation of economic policy and methods for the planning and functioning of our economy. He stressed that special attention should be given to the wealth of ideas and practical experience of socialist countries in which significant economic restructuring processes are taking place, including those that came as a result of accelerated technical progress and increased participation in the international division of labor..[Text] [Warsaw TRYBUNA LUDU in Polish 4 Feb 86 p 2]

IMPROVED STEEL-PRODUCTION TECHNOLOGIES INCREASE EXPORTS

Bucharest REVISTA ECONOMICA in Romanian No 49, 6 Dec 85 pp 12-14

[Excerpt from article by Dr S. Arsene, Stefan Gheorghiu Academy: "Meeting World Standards of Production and Export"]

[Text] A few decades ago steel production was one of the main indicators of a country's level of economic development because of that basic product's essential contribution to the development of all the other economic sectors and especially machine building, transportation, industrial construction and civil engineering, electrical engineering, etc. Due to the new scientific-technical advances, which have also made radical changes in the basic materials, steel production is no longer in the same direct correlation with a country's developmental level, but within certain limits it is indicative of a country's position in the world economy, particularly as regards quality and the refinement and better use of the respective resources. Whereas physical production of steel reaches a ceiling when the economy is saturated, a ceiling of 500-800 kg per capita in countries like the USSR, the United States, Japan, the FRG, France, England, Canada etc., the volume of production in terms of value tends to increase with better, intensive use, output of varieties with high technical-functional qualities (The United States, the FRG and Sweden are typical examples), large-scale recycling of scrap iron, etc. (The proportions of scrap iron in steel production vary among 60-70 percent in the United States, about 70 percent in the GDR, 60 percent in Sweden, 55 percent in Poland, etc.).

From the standpoint of this indicator, Romania's per capita steel output of 636 kg in 1984 places it on a level in keeping with the Romanian people's great efforts to develop and consolidate the national technical-material base. This point is made better by another indicator called the "metal supply" or "metal accumulation" in the technical literature, representing the entirety of the steel existing at a given point in installations, machinery, equipment, constructions, transport means, consumer goods etc. in use. This indicator is 7,000-9,000 kg per capita for the developed countries and below 300 kg per capita for the underdeveloped ones, while the world average is about 2,000 kg per capita.

The Romanian people's efforts to equip their national economy with peak technologies, highly productive machinery and installations, and a modern infrastructure as well accelerated the national metal accumulation, which is now about

3,500-4,000 kg per capita. But we are considerably behind the developed countries, which is one more argument in favor of adopting new technologies with better parameters from the standpoint of the performance-weight ratio. The restructuring of the iron and steel industry in the great producer countries by readjustment to the new consumer trends, to the new structure of production costs, and to the demands of the scientific-technical revolution for introduction and expansion of modern industrial processes has had and will have a powerful impact not only upon the evolution and structure of production and consumption but also upon the flows of trade in those products.

Use of the Metal Supply As a Macroeconomic Indicator

The Romanian party and state policy in the field under consideration was reflected in the steady growth of the volume of steel production, which showed average annual growth rates of 6 percent in 1970-1984. The growth rate of consumption of raw steel in Romania was somewhat more moderate, averaging 5 percent a year. As a result in recent years Romania has been in fourth and fifth place in the world in the evolution of production and consumption respectively, and it is accordingly in 12th place in the world in absolute production (after the USSR, Japan, the United States, the CPR, the FRG, Italy, France, Poland, Great Britain and Mexico).

While the two above-mentioned indicators showed the quantitative aspect of the inventory, the value of the gross national product per ton of metal supply is computed in order to evaluate the qualitative aspects of better, intensive use of the national metal accumulation. That indicator is still low in Romania. The indicator of created gross national product per annual output of steel is in a better state. For 1984 Romania logged a little over $3,800 of gross national product per ton of steel produced, compared with $18,000 per ton in the United States, $39,000 per ton in Switzerland, about $20,000 per ton in France, and about $9,000 per ton in Japan.

The gaps between Romania and the economically developed countries in use of the metal supply are wider than those in degree of equipment of the economy with metal (about 4-5 to 1).

Use of Modern Technologies Through Competitive Production Structures

In order to determine the courses of action to make more intensive use of the metal supply and to enhance the contribution of steel production to economic growth, numerous analyses and studies were made in the Galati Iron and Steel Combine, the national economy's chief metal supplier, which makes about 50 percent of the steel output and over 95 percent of the domestically manufactured steel sheets and strips, and it is also the only unit exporting rolled steel plates.

Very heavy investments have been made in this great iron and steel combine, and its technical equipment is being continued in the current five-year plan by activating a blast furnace with 3,500 cubic meters of useful volume, a new steel mill complex with converters and installations for continuous steel casting, two sets of coke ovens for 850,000 tons each per year, a sheet steel rolling mill with high technical-operating parameters, a rolling mill for semimanufactured products and other industrial capacities that will enhance both the physical volume and the technical-qualitative performances of the output. Organized for rolled products and equipped with a series of hot- and cold-rolling mills, the Galati Iron and Steel Combine makes over 350 varieties of steel, steel sheets up to 4,500 mm wide and 4-100 mm thick, and cold-rolled strips 0.4-3.5 mm thick and 1,000-1,500 mm wide, all for the shipbuilding, automotive, electronics, nuclear and aeronautics industries, marine drilling, and the chemical and energy industries.

Compared with 1950, when the Siemens-Martin and Thomas processes predominated in world production (78.7 and 10.7 percent respectively), now the process of manufacture in a converter with blasts of oxygen (the L/D process) accounts for more than 50 percent of production, the electric process over 20 percent, and the Thomas process is on the way out. Note that the Common Market countries and Japan produce over 70-75 percent of their steel in converters with oxygen, the most modern and efficient manufacturing process.

Alongside the efforts to increase the physical volume of production, the combine has taken steps to change the production structure radically in favor of higher-grade steels. Now 52 percent of the steel output is produced in oxygen converters, 18 percent in electric furnaces, and at least 30 percent in Martin furnaces. For purposes of comparison we mention that in 1965 about 90 percent of the nation's steel output was produced by the traditional process, in Martin furnaces, and only 10 percent in electric furnaces. Meanwhile the quality carbon and low-alloy steels were increased from 14 percent of the total steel output in 1950 and 31 percent of it in 1965 to about 47 percent at present, while the proportion of alloyed steels was almost doubled between 1965 and 1985 (from 5.6 to about 10 percent). Promotion of the new technologies created optimal conditions for making a diversified assortment of steel sheets of rustproof steels essential to the electrical engineering industry.

In view of the Galati CS's /Iron and Steel Combine/ leading position in Romanian industry, it has important assignments in the next period too in implementing the provisions of the Program To Raise the Technical and Qualitative Standards of Products, To Lower the Inputs of Raw Materials, Fuels and Energy, and To Make Better Use of Raw Materials and Materials in the 1983-1985 Period and up to 1990." As it says in that document, a special effort will be made in the next period to regularize the mechanical and technological properties of metallurgical processing products, to obtain optimal metallographic structures, and to enhance the finishing and dimensional precision. Controlled cooling of rolled products will be expanded, as well as the reheating and globulizing process and steel processing by broaching and hot drawing.

In development of production in this field in the next five-year plan the highly technical products are to be in a steadily growing proportion, such as new types of steel sheets of weldable, high-resistance, heat-treated structural steels; special bars and plates for the chemical, nuclear and aeronautics industries; electrotechnical strips with very high magnetic permeability; whole finished rolled products manufactured in a continuous flow; electrolytically tin-plated sheets, etc. It is also planned to expand the use of unconventional technologies for heat treatments and the facilities needed to increase the proportion of heat-treated iron and steel products by 1990.

Romania's trade balance in the item "iron and steel rolled products" indicates a considerable gain in the physical volume of exports from 318,600 tons in 1960 to 1,278,100 tons in 1970 and about 1.9 million tons in 1983 (with a growth index of 593.68 percent from 1960 to 1983 and one of 147.99 percent from 1970 to 1983), amounting to about one-fifth of the present national output of steel rolled products. Imports of this group of products steadily increased from 830,100 tons in 1960 to 1,360,600 tons in 1970 and 1,570,400 tons in 1975, while later they showed a steadily declining trend so that their physical volume in 1983 (733,300 tons) was below the 1960 figure for the first time. Corresponding to this evolution of the physical volume, the balance of trade in iron and steel rolled goods steadily increased its surplus in the last 10 years until that surplus exceeded the volume of imports by more than 50 percent in 1983.

Improvement of the Exchange Ratio

Whereas from the standpoint of the physical balance the respective evolution reflects a correct policy of gradually reducing the nation's dependence upon imports of these basic products, the analysis must be supplemented with a number of points, chiefly in connection with the effectiveness of Romanian exports of iron and steel products and especially of steel rolled products. The unit value of Romania's imports of those products far exceeds that of its exports because of the high-grade products and the special steels imported from the foreign markets. And since the development of Romania's iron and steel industry is based on imported raw materials, namely iron ore, metallurgical coal and coking coal, the sector's exports must also cover those imports, which were increased, in the case of iron ore, from 917,100 tons in 1960 to 6,267,800 tons in 1970, 15,984,000 tons in 1980 and 14,477,000 tons in 1983, and in the case of metallurgical coke from 655,800 tons in 1960 to 2,416,500 tons in 1970, 3,133,000 tons in 1980 and 1,715,000 tons in 1983, while the imports of washed coal for coke came to 4,293,000 tons in 1983.

Even this brief account shows the great importance of restructuring Romania's iron and steel industry to meet the requirements of the technical-scientific revolution, the consumer demands and the structural changes in the production costs, so that while reducing the volume of imports of higher-grade iron and steel rolled products we can supply both the domestic and foreign markets with greater quantities of these products on highly competitive terms. This requirement is especially urgent because Romania's exports of steel rolled products have not yet shown an effectiveness commensurate with the national efforts made to produce them, and as we know one of the main objectives of the five-year plan is to make exports more effective by eliminating the products that bring in little foreign exchange and making better use of the raw materials, energy and social labor, especially in machine building, metallurgy, the chemical industry, wood processing and light industry, sectors that will account for more than 65 percent of Romania's total exports.

While the varietal structure of Romanian exports of steel rolled products and semifinished products shows some favorable developments suiting the trends and demands of the world market, some shortcomings still persist that impair the overall effectiveness of the exports of iron and steel products. Amomg the favorable points we note the growing proportion of shaped products (about 17-18 percent in 1984), the relatively high proportion of casing pipes and down pipes, and the increased export of more highly processed products like metal netting, steel chains, etc. But maintenance of a high proportion of thick and medium sheet steel, with a lower proportion of thin sheet steel, and the still too limited presence among the exports of varieties commanding higher prices have a far greater effect upon the effectiveness of the exports.

In the 1981-1984 period the proportion of steel rolled goods in the exports of the METALEXPORTIMPORT ICE /Foreign Trade Enterprise/ evolved differently in the cases of the Galati CS's three different export items: (1) thick and medium hot-rolled steel sheets and strips 3 and more mm thick (including the strip steel), (2) Thin sheet steel, wide strips and hot- and cold-rolled steel up to 3 mm thick, and (3) galvanized sheet steel and strips.

The proportion of the first item, medium and thick sheet steel, in METALEXPORT-IMPORT's exports increased from 36 percent in 1981 to 41 percent in 1984 thanks to the increased manufacturing capacities and an emphasis on exporting more and more of the output, putting Romania in sixth place in sheet steel production and in fourth place in exporting it after the USSR, Japan and the FRG. But in the last period there were considerable reductions in the exports of thin and galvanized sheet steel of nearly 1 percent each in view of the increased needs of the national economy for those products and the heavy outlays on imports of raw materials needed to manufacture them, and especially on imported zinc.

Calculations of the effectiveness of the exports indicate that for a number of products like medium and thick sheet steel and hot-rolled strips some prices on the foreign market are causing difficulties for many traditional western iron and steel firms.

Accordingly it appears to be a viable solution to restrict the exports to the nation's needs and to use the respective products for processing in other sectors and other productive units so that they will attain higher indicators of export profitability.

The increasingly high production costs of the items thin sheet steel and galvanized sheet steel, due to imports of the raw material along with frozen or declining foreign prices, can lead to a low profitability. These products can be incorporated together with other raw materials, materials and semimanufactured products in more highly processed commodities that sell on the foreign market much better and lead to additional foreign-exchange collections.

The following are a few of the measures for technical and qualitative improvement of the products and structural improvement of production:

- Manufacture of sheet steel for export in the standard varieties in demand on the foreign market and for which the Galati CS has the technical manufacturing equipment, especially for sheet steel less than 10 mm and over 40 mm thick, 1,000-4,500 mm wide, and in all lengths between 4 and 12 meters. One of the Galati CS's outstanding achievements in better use of raw material is the capacity called the "section for welded pipes 1,420 mm in diameter for generators" with an annual capacity of 200,000 tons. It will produce welded pipes of large diameters for natural gas mains. The new manufacturing capacity's entire output is for export.

- Another improvement in the effectiveness of Romanian exports of steel rolled products is the production of commercial sheet steel with a guarantee of the technical parameters and according to the standard norms (BS 4360-50, BC and D1) and especially with observance of the specifications for smoothness, tolerances, surface appearance, etc.

- The increased proportion in the export programs of thermally cut sheet steel (normalized) or of types H1, H2, H3 and 16 Mn5 for boilers and grades B and D nautical sheet steel; qualities R-St 38-3, R-St 42-2 and R-St 42-3 and a of low-alloy sheet steel for pipes welded according to API [International Petroleum Association] standards, and quality grades A and B x 42x52x56x60x70. Offering sheet steel in the foregoing qualities according to the American, British and West German standards will lead to a considerable increase in the foreign price collected per ton of exported products.

- A higher proportion of the varieties of electrotechnical sheet steels and a wider assortment of standard sizes;

- Increasing the volume of exports of galvanized steel sheets and strips and offering tin-plated steel sheets and strips for export.

The geographic distribution of exports can also have an unfavorable effect upon their effectiveness. In 1984 about 52 percent of Romania's exports of medium and thick sheet steel was concentrated in only three countries (Japan, the United States and the FRG), and the concentration of thin and galvanized sheet steel was much more intensive, the United States, France and the FRG receiving 82 percent of Romania's exports of thin sheet steel and a large portion of the exports of galvanized sheet steel. Therefore it is an urgent and permanent task to diversify the geographic distribution of Romania's exports of steel rolled products in order not only to reduce dependence upon particular markets for sales but also to enhance effectiveness by means of a diversified range and determination of the more suitable times and markets.

GENERALS DISCUSS CAREERS, DUTIES, UNITS

Gen Zygmunt Zielinski

Warsaw RZECZPOSPOLITA in Polish 18 Jul 85 pp 3, 4

[Interview with Gen Div Zygmunt Zielinski, director of the Cadre Department in the Ministry of National Defense, by Andrzej Jurczynski: "High Standing of Cadre Operations"; date and place not specified]

[Text] One of the most important subjects discussed at the recent PZPR Central Committee 20th Plenum was the implementation of the "Main Assumptions of PZPR Cadre Policy," accepted at the 18th Plenum. This document also incorporated the experience of the Ministry of National Defense, which has solutions that have been proven in practical operations, and which has for several years been guided by established principles. They are the subject of our interview with Gen Div Zygmunt Zielinski, director of the Cadre Department in the Ministry of National Defense.

Andrzej Jurczynski: "These problems, which had been gradually prepared for solution, were finally solved in the Ministry of National Defense back in 1975, when the "Principles of Cadre Operations in the Armed Forces of the Polish People's Republic" were put into practice.

[Answer] The document mentioned describes cadre conduct and includes the following sections: Personality requirements and the course of service of various groups of regular (professional) soldiers; predicting and guiding the course of this service; establishing and utilizing an accelerated-development fund; selection for leadership positions; stages of training and advancement; system of cadre evaluation; honoring the cadre; and discharge from regular service. We applied specific elements of "Principles of Cadre Operations...", such as cadre inspections, much earlier, as they were being developed, since the overall concept of our cadre policy had already been established.

[Question] What does this policy consist of? Wnat is the substance of this cadre policy?

[Answer] The substance of the cadre policy applied in the army is made up of two groups of problems: The first includes actions relating to forecasts of professional cadre inflow and outflow and controlling this process in accordance with the needs of the service, taking into account the correct proportions between the corps and various specializeds groups. This area of our activities, just as all cadre undertakings, involves future action. Hence our forecasts cover a 15-year timeframe. Thanks to forecasting, we can accurately determine the size of recruitment to military schools and establish training in new specialties. Such thinking about tomorrow is particularly important in balancing national needs with those of the individual ministries. It also has farreaching social and economic effects. The second group of problems relate to the qualitative development of cadre and proper control of this process, including training and advancement, and providing a career path for the cadre, ensuring its efficient utilization in service.

[Question] The first condition in cadre operations is evaluation of an individual?

[Answer] Not just the first but the deciding. Cadre operations concern individuals, their opinions, values and predispositions. Individual interests must be reconciled with general interests. General of the Army Wojciech Jaruzelski, in his speech at the PZPR Central Committee 20th Plenum, said: "Cadre policy must be wide open to all those who are dedicated to the socialist fatherland, and it must be tightly sealed against those who do not have its supreme good in mind... When ideology, talent, knowledge and a creative stance are at stake, it is a duty to create conditions for those who want to improve reality, to decisively support them when they come up against inertia and torpor." That is why it is obvious that a penetrating and fair evaluation of people is essential.

In our ministry this is done through annual cadre reviews and periodic evaluations conducted every 5 years. The annual cadre review consists of a concise evaluation of every regular soldier's service values and the results of his work during the past year. This is a form of cadre operation which makes it possible to evaluate a person effectively, to outline his career path to him. Thus the evaluation has an important effect on his future. This review is conducted on all command levels. It ends with a conversation in which the superior informs the subordinate of the evaluation made on him. There is a large educational aspect in this, spurring the soldier on to even better performance of duties.

The cadre review also provides a certain psychological comfort to the professional soldier when he knows how his work has been evaluated and what his future may be.

[Question] Are these reviews a starting point for further actions, as, for example, the creation of cadre reserves?

[Answer] Certainly. In the army, these reserves are called an accelerated-development fund (ADF). During the cadre review, those who received the highest ratings are included in the fund, and those who received the lowest ratings are excluded. Here this dynamism of action, which we mentioned earlier,is clearly seen. The importance of ADF lies in selecting the most valuable people with the best future and creating for them optimal conditions for assuming successively higher staff and command and specialist positions. In developing the principles of the fund, we chose, as the starting point, a description of the postulated profile of a soldier, covering requirements as to his personality, ideological stance, qualifications, and a model of service performance. In addition to the general model, there is also a detailed model for every personnel corps and different specialties. As a result, we can make full use of all of an individual's mental and physical traits, his abilities and predispositions, and also ensure him the most appropriate career path.

[Question] What can a person who is listed in the ADF expect?

[Answer] First of all, he must devote a great deal of attention to improving his skills and undergo various forms of training. In the army, all professional soldiers are required by law to submit to training and improvement of qualifications. And this particularly pertains to ADF officers. This fund is our main source for assignment of officers to higher staff and command and political posts. A person on the ADF list can also anticipate faster promotion to a higher position, but this also means special training, and experience in lower positions, i.e., he must have tread the planned path for a given function.

At the same time, I want to say that in making assignments to responsible service positions, a special candidate-training program is in effect in the Armed Forces. It includes short courses and practice. Another way in which a candidate can prove himself for a leadership function is by fulfilling the duties on a probationary basis. If he passes this test within a specified time limit, he is confirmed for the new position, If not, he returns to a previous or parallel position.

[Question] In addition to the vertical promotions you describe here, are there any possibilities of horizontal advancement?

[Answer] Certainly, if skills are increased. I will cite only some. Regular (professional) noncommissioned officers and cadets may achieve military specialty grades--from third to master. For each of them the soldier receives an additional monetary allowance. Officers, however, may obtain educational degrees and compete in various forms of contests.

[Question] How can the implementation of cadre policy be assessed on the ministerial scale?

[Answer] The "Principles..." have become a disciplining factor in all of the cadre operations in the ministry. They improve operations and ensure honest interpersonal work. On one hand, they constitute a uniform interpretation in the conduct of cadre policy, and on the other hand they require all superiors to observe them strictly in everyday practice. There is a precise system of inspection and accountability in this area. At the last plenum, General Jaruzelski said on subject: "There is no implementation without inspection."

Another factor which guaranteed success in implementing the "Principles..." was the inclusion of the results of a wide-scale discussion at the time they were being developed. Many regular soldiers took part in this discussion. Thus, they are the result of the thinking of all professional soldiers. Thanks to this, we can also say that the entire regular army approved of these principles and became familiar with them. We are trying to eliminate all deviations from these principles, because it would take only one mistake on the part of each superior to make hundreds of them on the ministerial scale.

[Question] How would you sum up what has been said here? What general conclusions can be drawn?

[Answer] Good. Let us try to make such a summing-up. First, there can be no thought about effective cadre operations without general assumptions and a uniform system; all cadre operations must be subordinated to specific principles and must take place openly. Second, the supreme value which determines the effectiveness of cadre work is further humanization and a greater climate of full confidence by the people in cadre practice. Third, only consistent and constant application of the binding principles by the entire leadership cadre will assist in implementing the postulate--the right person in the right place.

[Question] What next? What are the cadre plans for the future?

[Answer] We will continue to perfect the mechanisms of cadre operation and consolidate public acceptance of cadre policy. We will concentrate our attention on evaluating soldiers more thoroughly, determining their predispositions and spotting their talents. We will strive to expand the reserve cadre at the middle level of command. We will also continue to define the service model of various specialties. Our goal is to humanize cadre operations. At the beginning of our conversation I talked about the 15-year timeframe of these operations. It is now 1985 and simple calculation tells us that we must prepare ourselves for entry into the 21st century.

Gen Wladyslaw Hermaszewski

Warsaw ZYCIE WARSZAWY in Polish 23 Aug 85 pp 1, 3

[Interview with Gen Brig Wladyslaw Hermaszewski, president of the main board of the Polish People's Republic Aeroclub, by Wojciech Kiss-Orski: "Art of Flying"; date and place not specified]

[Text] [Question] General, you have been in the army for 39 years and you are constantly flying. Why is it that you haven't gotten bored with it?

[Answer] How can flying be boring? It seems to me that it cannot. I look upon this as something of a marvel. For centuries, man has wanted to tear himself away from earth and this still continues to fascinate people. It is difficult for me to explain this rationally, despite the fact that piloting an airship is a function which is rational from beginning to end. For me, flying has been and continues to be an enormous passion. Although I am no longer piloting jets but sports planes, every flight for me is a real thrill.

[Question] On what, then, is the art of flying based?

[Answer] I will reply without a shred of romanticism. To me, it is the ability to divide attention and coordinate many actions which require piloting and technical precision.

[Question] Certainly this viewpoint would not satisfy very many people. After all, this is a dry, textbook definition.

[Answer] Yes. But in my opinion, this is what flying comes down to. All other frequently colored and imagined statements on this subject are literature. Romanticism ends at the moment the plane and the pilot, after the plane has left the ground, must become as one, working as a team. There simply is no time for romanticism.

[Question] You have spent almost 5,000 hours in the cockpit. Always with that passion?

[Answer] Always. I wonder about this myself. So many thousands of hours in different cockpits, more and more modern, crammed with instruments and devices which require constant attention and the highest concentration. And yet one likes this and gives himself up to it totally. But frankly speaking, there were times when it would have taken very little for me to give up flying...

[Question] ...probably papa did not allow the young boy to fly?

[Answer] No, that was not it. Papa was no longer living then. He was killed in 1943. My early aviation career was different from those of many others. There was no family tradition, no beginnings in a flying club. To this day I don't really know what drew me to aviation. In 1948 I applied as a volunteer at Deblin and after passing the tests and medical examinations I was accepted. I wanted to be a fighter pilot, nothing else. But to return to your question... the instructor who took me up on my first familiarization flight, in a UT-2 training plane, behaved rather badly, I think. He executed a set of basic acrobatic maneuvers that were a real shock for someone unaccustomed to being in the air. I was half-conscious and when we landed I wondered whether or not I shouldn't abandon the thought of flying. But another instructor, Warrant Officer Pietrucha, brought me around and taught me to like flying. He was a good teacher, an instructor pilot by calling, and it is thanks to him that I am still flying today.

[Question] When did the real, dreamed-of, fighter-plane flying begin for you?

[Answer] In 1949 after completing training on the JAK-9 aircraft. That was truly a beautiful machine. When it took off with its graceful silhouette, small wings, and 1,200 horsepower engine, it looked like a rocket. During flight the air seemed to change into modeling paste, and this was felt both in the controls and in oneself. It was then that I fell in love with flying for good, and because I began to get grades which, I must say , were better than good, I was doubly happy.

[Question] According to many pilots, the JAK-9 was really a class fighter-plane, but after all, the era of jet aircraft was approaching. You spoke about the aviation of the 1950's, which was just before important changes took place.

[Answer] After a promotion in the Air Force Officers School in Deblin, I was assigned to a fighter-aircraft unit which was commanded then by Maj Edward Chromy. Later I served in the capital, in Bemowo. And that is when these important changes that I spoke of began--the adventures with jets. At Bemowo, 14 airmen were selected for training on jet aircraft, including me, who was the youngest, both in age and in length of service. We were sent to a Soviet air base. At that time everything was maintained in the highest secrecy so we did not learn where we were to land and why an LI-2 was accompanying us until we were in the air. We trained for several months. First these were JAK-17s. When we returned again we trained on JAK-23s, and then on successive versions of MIGs.

[Question] You are today probably the only actively flying representative of that first postwar generation of Polish fighter pilots who were the first to fly jet aircraft.

[Answer] No, I am not the only one. There are two of us. Col Smolik is still flying. Of the better-known pilots of that period, who later performed important functions in Polish aviation, we should mention Capt Tadeusz Krepski, later a general, commander of the aviation troops, and Capt Stanislaw Tanan, now an aviation colonel.

[Question] The move from a propeller plane to a jet plane must have been a great experience.

[Answer] An enormous one. Such a machine aroused real respect. Different velocity, swept wings, no propeller in front--to which one had been so accustomed ,an airtight cockpit--in short, completely different engineering, really an epochal leap. Only one thing in all of this did not change--the essence of flying. The pilot always had to know how to anticipate and be prepared in flight for every eventuality. By so doing he saved himself a lot of emotion and unwanted troubles.

[Question] And were there such moments?

[Answer] Without them there is no flying. I happened to be very fortunate. In 1952 I made a forced landing in Bemowo in a MIG-15 with a dead engine, which, given the experience and instruction of that time, should not have been possible. I was already over the airfield and entering the third turn when the engine died. I was still able to make the third turn--a short one, but the fun began with the fourth. With the engine gone, I had to maneuver the speed of falling so as to be within the boundaries of the airfield. I lowered the landing gear at the last second, but the plane began to drop dangerously anyway. I was falling directly on the hangar. Probably subconsciously I then released the flaps, which gave the plane a little more aerodynamic lift, thanks to which the hangar is still standing and I'm living.

[Question] Many Varsovians remember the flybys, which unfortunately are no longer seen. You looked down at Warsaw from the plane in those days.

[Answer] I took part as a pilot in all air parades in postwar Poland. They included the dedication of Dzierzynski Square in 1951, when for the first time, with others, I demonstrated the JAK-23 jet; in 1955 during the youth and student festival in Warsaw; in 1953 in Katowice; in 1954 over Lublin for the 20th anniversary of the Polish People's Republic; and in 1960 I led a formation of 64 MIG-17 planes over the Grunwald battlefields. I also took part in the air parade of the Millenium observances in 1966.

[Question] Almost 5,000 hours in planes, i.e., almost 7 months without interruption, dozens of different kinds of planes, and now you are flying the Zliny and Kolibry sports planes in the aeroclub. What was your first flight like? Do you remember it?

[Answer] It was in Deblin. I made it in a UT-2, a 125-horsepower single-engine low-wing monoplane, which could reach a velocity of 160 kilometers per hour. I was so happy that I was flying solo that I yelled with joy. I yelled so loud my friends on the ground must have heard me.

[Question] In Krosno at the aeroclub one of the two remaining CSS-13 planes, i.e., the licensed PO-2, called the "kukuruznik" [a type of Russian aircraft], is still flying. I know that you flew it not too long ago. It is probably similar to the plane on which you first began as a pilot.

[Answer] Except that it is a biplane. The engine is the same. Of course, flying the "kukuruznik" today is an emotional experience. An open cockpit, an engine in which the valve lifters jump up and down during flight... anyway, there is a rather amusing history bound up with this plane. In 1953, when I was commander of a squadron in Bemowo, we received a liaison "kukuruznik." But no one knew how to pilot it. I was assigned to test-fly it. When everything went well and I began to fly it regularly, I was assigned to drop parachutists. The parachutist sat in the forward cabin and the plane was piloted from the second cabin, which was not very comfortable. So when the parachutist jumped, I changed seats in-flight to the first cabin and that is how I landed. One day after landing the commander charged me with violating regulations, because dropping parachutists from the second cabin was not allowed. I explained that--as I believed at the time--I did not violate any regulations because I simply changed seats in=flight. Of course I was severely punished and I never did that again.

[Question] You mentioned in the beginning that your family did not have an influence on your going into aviation. Did your two younger brothers, Boguslaw and Miroslaw, go in because you did?

[Answer] I don't know that they followed my example. Perhaps they answered their own call, just as I did.

[Question] General, let us end our conversation on a festive note. Today marks 41 years since the the first formations of the Polish People's Air Force joined the frontline battles with the Germans, executing operations in the region of Warka and Magnuszew. The 23rd of September 1944 marks the beginning of annual observances of Air Force Day. In connection with this holiday, what would you like to say to the people in the Polish Air Force?

[Answer] First of all, my sincerest esteem and respect to all of the veterans of our Polish aviation, the people who spilled their blood for Poland, and who in the postwar years with such dedication and commitment gave of themselves to educate and train the present generations of airmen. I want to express my gratitude to all of those who regularly, in the regional aeroclubs, stint no time or effort in training the young people. And finally, to all young and ambitious boys and girls: May they want to become part of what is, in my opinion, the most magnificent field of this age.

Gen Jerzy Skalski

Warsaw TRYBUNA LUDU in Polish 13 Sep 85 p 3

[Interview with Gen Div Jerzy Skalski, commandant of the Warsaw Military District, by Stanislaw Reperowicz; date and place not given]

[Text] On 14 September 1944, units of the Polish First Army, in cooperation with the Soviet Army, liberated rightbank Warsaw-Prague and hurried to the aid of the insurgents. The Polish detachments, after forging the Vistula, established two bridgeheads on its left bank: one at Czerniakow and the other at Zoliborz. At the cost of an enormous toll of lives, they held them until 23 September, when under the pressure of the enemy's overwhelming strength, decimated, they were forced to retreat to the Prague shore. They forged the Vistula River again on 17 January 1945 and liberated the capital. They then took part in restoring ancient Polish lands, as far as the Odra, Nysa-Luzycka, and Baltic, to the mother country.

In the Warsaw Military District there are units which are continuing the frontline history of the divisions and regiments which 41 years ago spilled their blood on the streets of Warsaw. Several of them have been honored by naming them "Warsavian" and "Praguean. I asked General Skalski how these beautiful combat traditions are known, respected, and developed by today's generation of soldiers.

[General Skalski's answer] We acquaint our successors with the broad panorama of Polish fortunes and misfortunes. We teach our soldiers that first there was the tragic September of 1939, when the weakness of the social and state system and the lack of the right political and military alliances led Poland to the loss of its independence. The second September, in 1944, and the restoration of independence, became possible because the Polish left drew the correct conclusions from the previous September and based its struggle for liberation on an alliance with the Soviet Union. Now we have another September, the 41st in peace, in a year in which we observed the 40th anniversary of the victory over nazism. It is important to Poles also because of the approaching elections to the Sejm. This is indispensable to the security of the Polish People's Republic.

The traditions of the battle for Warsaw are very dear to us all. The mermaid in the crest of the city of Warsaw is a symbol of this. Furthermore, the 40th anniversary of the formation of the Warsaw Military District (WMD), which occurs this year, will be observed on 14 September (by working) to honor the liberators of Warsaw.

[Question] This anniversary is an excellent occasion to take a look at the past.

[Answer] This was a past of struggle, loyal service, and intense work for the fatherland. The WMD soldier who performed peaceful sentry duty on the Vistula, Bug, Narew and San rivers in the first days of the People's Republic performed two basic functions: He defended the recovered independence and he participated in establishing a new social order; he cleared the land of mines and divided it among the peasants in the agricultural reform; and he helped the settlers arriving in Warmia and Mazury and in the rebuilding of Warsaw.

[Question] I would like to ask about the place of the WMD in the armed forces.

[Answer] The WMD soldiers in executing their assignments in the country's defense system prepare themselves to defend independence and socialist achievements. Ties of friendship bind us with the soldiers of the Warsaw Pact armies. Our district maintains particularly close contact with our closest neighbor, the Belorussian Soviet Army District.

The WMD is made up of units which have various assignments in the performance of defense tasks. The favorable evaluations which they obtain during inspections by higher commands attest to the fact that they perform their duties properly. Each year several WMD detachments are singled out for distinction in the Ministry of Defense training order. Our artillery, chemical, antiaircraft, antitank, and reconnaissance personnel receive high standings in the army's top-level combat-utility competitions. We have unquestionable achievements in the development and application of modern mobilization and alarm systems and effective methods of training personnel reserves. Last year the number of top personnel designated exemplary soldiers, commanders or leaders, doubled.

[Question] To be designated "Exemplary Soldier" requires a great deal of effort, far beyond normal duty requirements. Despite that, thousands of young people achieve this each year.

[Answer] That is the result of the educational influence of the army on the young citizens called up for basic military duty. Young, raw, and sometimes somewhat frightened boys, not quite 20 years old, come to us. We teach them the defense craft, but we also teach them to live in a group. We inculcate civic attitudes and convince them that solid work is the basic duty of every Pole. After 2 years, when they go into the reserves, they are already men, physically fit, mentally strong, ideologically committed, prepared properly to perform their duties to the fatherland and the nation. They are socially mature.

Two years of service are a strong influence on a soldier's personality. Actually, the entire term of military service serves to shape attitudes. Planned political training, participation in social life, work in party and youth organizations--all teach respect for human generosity and effort and draw out the values of socialism.

Last year in the WMD several hundred more soldiers were accepted as candidates for the PZPR than in 1983. However, during the first quarter of this year alone twice as many soldiers joined the party than during the same period last year. These changes in soldiers' attitudes during military service are even more evident when we look at the growth of membership in the ZSMP (Union of Socialist Polish Youth). As a rule, during conscription, scarcely a few members of youth organizations are found in each subunit, while several score are unaffiliated. When they complete their service, at least every other soldier is a member of ZSMP.

[Question] We see that the ties between the army and society are growing stronger.

[Answer] We maintain them primarily with the working class and the countryside. Workers and farmers are our guests and we are theirs. We try not to lose contact with reservists, former professional soldiers, and former soldiers in the regular service. Many party and youth activists are recruited from among them. In our district over 100 educational institutions are named after heroes of the Polish People's Army, or after frontline military units. This makes it easier to reach the youth studying in these institutions. The officers working as instructors in the ZHP (Polish Scout Union) can be very proud of their good achievements. Military units are patrons of over half of the various types of schools, state children's homes, and youth arts and sports groups. All these contacts bring youth closer to the military and to the ideals which it serves. They promote patriotic and internationalistic attitudes in the young generation.

[Question] The examples given speak of the participation of the army in a nationwide program for bringing up the young generation to be knowledgeable builders of a just, thriving and secure Poland. The participation of our armed forces in overcoming the socioeconomic crisis is also well-known.

[Answer] Our soldiers participate in this process in all kinds of ways. There are various functional units in WMD and in the army. Some of the units, as, for example, the territorial defense units, specialize in performing production-training tasks. They build roads, railroad tracks, houses, factories, repair municipal equipment, and work in key industrial facilities. In Warsaw they worked on rebuilding all of the important buildings.

In addition, the remaining units, called line units, also work for the economy and society. For example, WMD engineers build several bridges each year for the civilian population. Other units recently dug over 30 deep wells in Radom Province in villages which had no potable water. Currently, WMD soldiers are working on construction of a metro and reconstruction of the capital's transportation system. Although it is already 40 years since the end of the war, engineering patrols in the WMD recover approximately 100,000 deadly objects from the ground each year, thus saving many human lives.

In helping the country, they are learning. Every fifth soldier in the WMD acquires a vocation in the army, and every second or third improves the skills he already has.

[Question] I have heard that the army teaches good management.

[Answer] We try to teach the soldiers the habit of economizing on everything: weapons, spare parts, fuels, energy, etc. In this way we want to establish a sense of concern for public property. We also teach correct organization of work, which helps to improve management efficiency.

We produce many things ourselves, thus reducing budgetary expenditures. For example, most of the training aids are made by the soldiers themselves under cadre direction. The houses and preschools built by the army greatly alleviate the housing shortage in some garrisons and increase the number of educational institutions. The WMD health services supplies the social health service with large amounts of blood and produces, for its own needs, infusion fluids which are hard to obtain. It organizes herb-gathering by soldiers.

The idle farmlands on the fringes of firing ranges have been developed in recent years and and now yield almost 31 quintals per hectare. The hogs and cattle raised near the barracks cover approximately 50 percent of the WMD meat requirements. Expanded cultivation of vegetables under plastic, delicatessen-confectionary production, fruits and vegetable processing, meet the need of many units.

The construction of inexpensive little houses on firing ranges out of old railroad cars and forest windfalls is another endeavor worth mentioning. These little houses are very functional and much cheaper than tents. The cooperation of the WMD billeting and construction services with scientists in the construction of new concrete sewage-treatment plants and water-purification facilities is very important for environmental protection.

[Question] In thanking your for the interview, General, I would like to say that society highly appreciates the achievements of the WMD in strengthening the country's defenses and the national economy. The fact that the soldiers of this district have been entrusted with many important electoral posts is an expression of this regard. In the WMD, 147 professional soldiers are active in the leadership of local party echelons, 197 are councillors at various levels, over 800 are in PRON (Patriotic Movement for National Rebirth), 727 are in ZHP, and almost 300 are in civilian ZSMP boards.

The submission of your name, Comrade General, by the Provincial Elections Advisory Council, as candidate for deputy on the district ballot in Warsaw, is the highest proof of this esteem and confidence.

Gen Tadeusz Tuczapski

Warsaw SKRZYDLATA POLSKA in Polish 13 Oct 85 p 3

[Interview with Gen Arms Tadeusz Tuczapski, deputy minister of national defense, chief inspector of territorial defense, by Henryk Kucharski, editor of SKRZYDLATA POLSKA; date and place not given]

[Question] The Polish People's Republic Aeroclub greeted the 40th anniversary of the reactivation of its operations with some splendid successes on the international arena. They include the individual and group aircraft world championship in precision flying, won in August; the group and individual gold medals won late in August and early September for the world championship in glider acrobatics; and the Aeroclub team's first place in individual and group competitionts for the world championship in aerospace model-making, also in late August and early September. Do these achievement, in your opinion, General, fully reflect the 40-years' work of the Aeroclub and do they show that this organization is working properly and in the right direction?

[Answer] These wins, which bring fame throughout the world for the skillfulness of Polish pilots and modelists and are good publicity for our equipment, apply to only a small segment of our operations. In addition to the relatively still-selective airplane and glider operations, and model-making on quite a large scale, the Aeroclub's statutory operations cover a much wider range of problems. These include our expanding work with the young people, the entire system of airplane, glider, balloon and parachutist training, the spreading of knowledge among the people about aviation and its traditions, the development and dissemination of aviation and aerospace sports, the practice of aviation and aerospace model-making, cooperation with the army in preparing candidates for aviation schools and service in the air and airborne landing forces, etc. In all of these areas, the Aeroclub is getting definite results, albeit not as much as it would hope for, or could. But they are evident, attest to the increasingly better operations of the particular elements of the Aeroclub, and contribute to its overall achievements. This means that one must look more broadly at the traditions and achievements of this organization, which is, after all, a very useful society, than simply through its international successes in aviation sports.

[Question] You mentioned the wide-scale work being done by the Aeroclub among the youth, work that is being increasingly expanded. Would you please say more on this subject?

[Answer] The Polish People's Republic Aeroclub, just as many other organizations and societies, devotes a great deal of attention to large-scale work with young people and regards this work to be one of its primary tasks. It is from this environment that candidates for future contestants and activists are recruited, and it is this environment that is particularly responsive to the Aeroclub's attractive forms of operation. This environment is also one that needs society's influence very much.

In our wide-scale work with young people, aside from training them in various aviation disciplines, polytechnic training, mainly in different types of model-shops, plays an important part. We also place very high value on defense of patriotism, expansion of interests, adherence to national traditions--and not just those of the air forces, social activeness, and a deep interest in community and welfare work.

The young people who are members of the Aeroclub, but even those who are not members but who encounter the work of this organization, thus have many opportunities to develop creatively and properly utilize their abilities and predispositions, expand their knowledge, and improve their skills, e.g., in model-making, flying, jumping, etc.

[Question] Are there definite benefits to the Armed Forces and the country's defenses out of all this?

[Answer] The Polish People's Republic Aeroclub, a highly useful society, fulfills an important function in the life of the country and its people, both by popularizing traditions, as well as by its ongoing achievements. Thus its activities cannot help but be connected with everything that is happening in the country and they are very important. They serve the state and society, if only by shaping social attitudes, offering polytechnic training to the young generations, preparing candidates for specific vocations, as, e.g., a pilot for agricultural or transportation aviation.

The Aeroclub prepares youth for service in the air force and in the airborne troops detachments. It makes it possible for them to study to be pilots, to learn navigational secrets, jump from an airplane, and stay in good physical conditions through participation in aviation sports. It also makes it possible for reservists to maintain constant efficiency and prepares candidates for the Higher Officers Aviation School as well as military aviation schools in general. It also executes tasks in the field of civil defense. All of this, after all, serves the country and its defenses.

During the entire past 40 years, the Aeroclub always demonstrated obvious results in this field and for this praise is due not only to the full-time employees of this society, but also to the vast number of volunteers who unstintingly contribute their own time and labor to multiply the Aeroclub's achievements, attaining better and better results within the country as well as abroad. I would therefore like to take advantage of this anniversary to send sincere military greetings to the aktiv and all Aeroclub members, to wish them further splendid successes in their daily activities and all kinds of good luck in their personal life.

Gen Longin Lozowicki

Warsaw ZOLNIERZ POLSKI in Polish 13 Oct 85 pp 5, 7

[Article by Zbigniew Damski: "A Sketch for a Nonceremonial Portrait"]

[Text] If a person in any kind of position says that he absolutely has no time for anything, then he is not fit for that position and should resign, because he simply does not know how to organize his work.

I emphasize that statement heavily because although I waited for a meeting with its author, he did find the time.

Ask the commander of the National Air Defense Forces (WOPK) where and what kind? Nonsense. And meanwhile Gen Div Longin Lozowicki smiles pleasantly and adds:

--It is worse with private time, time for oneself. I like to hunt, and this year I was only able to go out with a rifle once. I was fishing about three times, and worked in the garden plot probably about five times...

But on that garden plot (... really a working plot, without a dacha...) there is a telephone and in the official vehicle, which stands nearby, there is a two-way radio. The same holds true when on the river or lake, where the fish are.

--You say that I am always "on a leash?" Those are the obligations.

*

It was said of the WOPK once that those are "the first 5-minutes forces.

--Today that is no longer true, says the general. Maybe three, or even less...

Well, people are thinking. Too bad that they are thinking about how to annihilate others most effectively, but regrets alone are of no help here. We must defend ourselves. That is what the forces commanded by General Lozowicki are for. How can one describe most simply, and in an understandable way, what these forces are and what are their assignments?

They fall into two basic groups: means of detection and means of combating. The first group is comprised of radio-engineering troops, the second is made up of aviation and artillery, both rocket and gun. Altogether it is a compact and closely interrelated system, covering the entire country with its network, with particular attention to the most sensitive regions, e.g., open borders.

Understandably, a possible air attack should be detected as soon as possible, as far as possible from our own borders (these speeds today!) and at all altitudes. This is what the most modern radio and electronics equipment is for, because time here is counted in seconds. To service this equipment, people with the highest professional skills are required--but more than that...

continues. Here everything can depend on an ordinary operator, a soldier in the regular service. And man always decides: a machine only supplies him with the information.

It just happens that right now the film "Star Wars" is being shown in the Warsaw theaters. It depicts the mad vision of a "thinking computer" which, once it is recklessly put into operation, whips people intounleashing a nuclear catastrophe. Brr...

--But even in this film, in the end man did the deciding. That is a good sign, but that is also why we demand a great deal of our people.

It takes an excellent and self-reliant pilot to take off on an "interception" assignment, a beautifully trained crew to launch various types of rockets (those to bring down targets at low ceilings, great distances, etc.), and well-staffed antiaircraft gun detachments, which low-flying pilots have always feared so much. But what an enormous responsibility is borne by the person who decides that the planes will take off or that the rockets will be fired.

--That is true, General Lozowicki says. but we are operating in a well-organized system. Not just a system within our own country: this system also encompasses our neighbors, the entire defensive socialist community. Our "protective shield," for example, is supported by Soviet satellite stations, which ensures our main goal: "There can be no surprises." And if we add to this the certainty that everyone will do in his position what is assigned to him and do it well...

--And where does this certainty come from? After all, right now the entire country is talking only about that, about results, because they are not always apparent...

--...because people musts be properly selected, educated and trained, and mainly, their work or service must be organized. Sensibly, so that everyone can see the sense in it, everyone knows his place and feels that he is fully responsible for it. In our service we had to attain this. Furthermore, there can be no "irreplaceable" people: In this system it is inconceivable that there may be a vacancy in some position because someone got sick, for example. There is a firm rule in WOPK that everyone must have a trained substitute and successor.

And here the general again smiles, but with perversity:

--...and that is why I can go on leave for a whole month and not have to call my office even once. I know that when my presence is indispensable, they will find me. I simply must trust and believe my subordinates.

*

It is not necessary to add that everything that concerns the activities of the WOPK and the complex duties and responsibilities of its commander, has been presented only in a very general way, sketched with a broad brush. But I think it is sufficient to grasp their real dimensions and the importance of that which they serve.

--And how does one become commander of such a powerful and complicated machine as the WOPK?

--That is a rather long and complicated story. Basically, I became interested in air defense problems during my year of service in Korea, in the International Commission for Control and Supervision. I was there in 1953 when the cease-fire at Panmunjom was signed, but I also saw the tremendous destruction, and the poor efficiency with which modern planes, because they were already jets, were fought by old, traditional methods of combat. After I returned I concerned myself with these matters in the appropriate division of the General Staff.

Here we must begin to "count backwards." If the man who is a general today was born in 1926 and was already an officer in 1953 (and one worthy of representing the armed forces abroad), when did he begin?

--Early, just like the rest of my entire generation. Of necessity.

*

Wolyn, 1939. The village of Nowa Czolnica has only a four-grades school. In order to go on, one must go to Przebraza, 5 kilometers away. That is where the partisans were, and that is where he helped to defend Poland, in Przebraza.

--...and we defended there until February 1944, when we were liberated by the Soviet Army. In March I was already in Sumy, where the 4th Inf Div was being formed. I was very lucky that I was 17 years old, because they didn't accept anyone younger than that.

Officers school in Riazan, a second lieutenant's star, and then assignment as deputy commander of the 37th Inf Regt, 7th Inf Div. Lublin, Radzyn Podlaski, and from there in the first months of the severe 1945 winter the 37th Inf Regt began its long trek through Poland, together with the entire 2d Polish Army.

--No one has yet described this long journey. And it was really an odyssey, through Kutno, Krzyz and Gorzow, and from there through the Poznan and Wroclaw regions. We did not reach the Nysa [River] until 10 April.

Fording the river (...I waded, holding on to a taut rope, up to my neck in water...), several days of heavy combat on the left bank.

--I was at that river many times years later. And I always looked at it with amazement: Such a dinky little river...

At Daubitz, repulsing the attacks of Field Marshall Schorner's advanced armor units, he was wounded in the hand. A miserable hospital in a brick factory, in what today is Ruszow. When the next wounded from his regiment were brought in, he simply escaped with the drivers. He still made it to fight in Czechoslovakia, near Rumburk. When the war ended, 11 May 1945, he was 4 kilometers from Mielnik, in Czechoslovakia.

--I was 19 years old then, a lieutenant and a company commander. Not a large company: out of 70 people, 22 remained.

*

The end of the war, new matters. First, along with his augmented company, he "farms" in the region of Zgorzelec and Bogatynia. There is no victory without bread. Then other problems fall to him in that part of the country: the campaign to evacuate the Germans and resettle the repatriates from the eastern areas in the recovered territories.

--And what then? Still in Chorzow the defense of the referendum and immediately an assignment to the Infantry Training Center in Rembertow, command of a noncommissioned officers school for a while, and in 1949, the beginning of 3 years of study at the General Staff Academy. Then the already mentioned year in Korea, work in the General Staff, and finally, in 1968, the WOPK.

These last parts of the military resume sound rather dull, but my interlocutor has this fine gift of reducing matters to ordinary, human dimensions:

--...and during those years I had to move 18 times. Except that then a person was young and didn't have much to take along with him...

Here General Lozowicki falls silent for a moment, as if looking back into the past, and finally adds:

--That is why I now find my garden to be so satifying. It is really as if a person were somehow returning to his own roots.

*

He will have to help his wife in gathering the crops from this garden.

--Because, somehow, the young ones are not very eager..

The "young ones", both sons, are in the neighborhood of "30". They have college educations, and work (or rather, serve, because the older one is in the militia and the younger one is in the army. They have families, and there are two granddaughters.

--Strange, but one somehow looks differently at grandchildren. No, he is not saying that he loves them any more than he did his own children when they were little, but...?

On the subject of family the general has a definite opinion: that is the foundation. A good family. A real family. People who know how to establish such a family for themselves are, aside from everything else, "socially valuable." The general has a wealth of experience on this: three-fourths of the WOPK staff are professional cadre, and the troubles and problems with people and their service performance most frequently arise where some kind of family discord exists.

But these discords today often depend on objective factors: financial conditions, lack of housing...

--That is exactly what I was aiming at.

General Lozowicki asks the following basic question: Does housing construction require "foreign-exchange intensive" import? No! We have all of the basic raw materials right here in our own country, and there is enough "processing capacity" if...

--I often travel throughout the country, the general continues, because my work requires it. And I must concern myself with matters of the areas where OPK troops are stationed. The housing construction field is a veritable jungle. In some areas there are enough materials, but money is lacking. In others, the money is there but there is a shortage of contractors, or materials. What is really lacking in such a case? ORGANIZATION! Organization, and once more, organization. Healthy, sensible organization, where action is directed at achieving the desired goal.

As in the WOPK. That is my own comment added to the general's words. Incidentally, it is too bad that Gen Div Longin Lozowicki is not running for deputy in my district.

POLITICS BULGARIA

RECENT HIGH-LEVEL CHANGES IN GOVERNMENT EVALUATED

Paris LE MONDE in French 29 Jan 86 p 5

[Article by Waltraud Baryli: "Changes in Party Leadership and Government"]

[Text] Two months before the Bulgarian CP congress, a reshuffle of some significance has been carried out in the leading bodies of the party and government by an "enlarged plenum" of the Central Committee that met on Friday 24 and Saturday 25 January in Sofia, followed 2 days later by a meeting of the National Assembly. The promotions and penalties that were decided on do not include any major surprise, however they do strengthen the position of two men who had already been in the ascendancy for about 2 years: Ognian Doynov, who has been appearing more and more as the big expert on economic issues, and Chudomir Aleksandrov, now member of both the Political Bureau and the Central Committee Secretariat, which puts him in a suitable position to assume, if need be, all or part of the functions of the party secretary general, Todor Zhivkov.

The latter, 75 years old and in power for more than 30 years, is certainly fit as a fiddle, but since the accession to power of Mr Gorbachev in Moscow the gerontocracy is really no longer in fashion, and Mr Zhivkov's personal position seems less unshakeable than in the past, while the country's economy, subject to increasing demands by the USSR, also seems clearly less hearty.

In principle, the transfers and reorganizations that have been carried out, particularly within the government, are dictated by the concern to better deal with the "scientific and technical revolution." Mr Zhivkov told the Parliament: there lies "the key, and even the superkey, to the building of the new Bulgarian society."

Men on the Rise

Vienna--Three councils--an economic council, social council, and council for science, culture and education--will henceforth coordinate the activities of the ministries and institutions concerned, while the creation of a "superministry" of commerce is regarded as helping to harmonize production and supply to the market. These are the main innovations characterizing the new organization chart of the Bulgarian Government, within which the relative weight of the "technocrats" seems increased.

Leadership of the most important of these councils--the economic council--has been entrusted to Ognian Doynov, a 50-year-old engineer, who is at the same time member of the Political Bureau, secretary of the Central Committee, and minister of machine building. Mr Doynov--who is regarded as close to the Zhivkov family--is the only Bulgarian leader to combine such functions.

The second rising star in the Bulgarian party is Chudomir Aleksandrov, a 50-year-old engineer who studied in Leningrad. Mr Aleksandrov, appointed Central Committee secretary, had already occupied this position from 1981 to 1984. He is a member of the Political Bureau and first deputy prime minister since 1984, a post that he left to return to the Central Committee Secretariat, where he will be in charge of scientific and technological matters. According to some observers, Aleksandrov is among the possible candidates to succeed Todor Zhivkov, who is 75 and the "doyen" of the Eastern leaders, and who some say intends to retire.

Among the main victims of the reshuffle is Todor Bojinov, Political Bureau member, minister of supply and deputy prime minister, and Stanish Bonev, alternate member of the Political Bureau and deputy prime minister, who were relieved of all their functions. They were apparently punished for their responsibility in the economic management failures and have been strongly criticized in the Bulgarian press during the last few months.

On other hand, we should mention among those who are "rising" Stoyan Markov, an electronics engineer, 43, named in 1985 to head the Science Committee--renamed the Research and Technology Committee--and now promoted to alternate member of the Political Bureau. He has also been named first deputy prime minister succeeding Mr Aleksandrov.

On the ministerial level, the establishment of a superministry, with the simple title of ministry of commerce, in charge simultaneously of production, supply, foreign trade and resources, seems indeed to strengthen centralization, whose rigidity has already been criticized in the Bulgarian press as responsible for the economy's sluggishness and lack of efficiency. This ministry will be directed by Hristo Hristov, until now minister of foreign trade.

The former ministries of production, trade in consumer products, foreign trade, supply and construction have been eliminated, and some of their directors named to other posts.

BULGARIAN DAILY REPORTS ON ALBANIAN AFFAIRS

AU311957 [Editorial Report] Sofia OTECHESTVEN FRONT in Bulgarian on 29 January 1986 carries two articles on Albanian affairs: on page 5, an 800-word "own correspondent" report on the Albanian economic plan for 1986, entitled "An Ambitious Program for Future Development;" and a 1,000-word travelogue by Lyubomir Kolarov on page 7 entitled "In the Mat Gorge."

The first report gives a factual account of the proceedings at the eighth session of the 10th National Assembly of the People's Socialist Republic of Albania, held in mid-January 1986. It reports on the "approval of the plan for social-economic development of the country and the budget for 1986." The report also gives details of the economic plan fulfillment for 1985 in industry and agriculture, mentioning that "in 1985, 120 important national-economy and social-cultural installations were brought into operation."

The report then gives a factual account of the economic plan of Albania for 1986, providing for increases in the gross national product, in petroleum and gas production, mining, engineering, and other branches of industry, as well as in agriculture. Some details are also given of the 1986 state budget. The article is generally positive in tone.

Lyuben Kolarov's "report" from Albania hears the subheading: "A Sunday spent near the great river--giver of electric power and water for the national economy." Kolarov first emphasizes the wealth of water resources enjoyed by Albania, notwithstanding the drought suffered in 1985. He then continues with an account of his car trip to the Mat Gorge, about 70 km north of Tirana, emphasizing the natural beauties of the area, and giving population and geographical data. Kolarov then gives an account of his visit to the "Karl Marx" hydroelectric station in the Mat Gorge, the present capacity of which--300,000 kilowatt-hours--Kolarov notes will be increased to 2 billion kilowatt-hours when the four turbines imported from France are commissioned. Kolarov emphasizes that the region contains "marvelous places for recreation and the development of tourism."

Kolarov then describes his visit to the town of Ulze, mentioning a poster he saw announcing a meeting of the local organization of "the Democratic Front of Albania (equivalent to our Fatherland Front)." He describes the continuation of his trip along the lower reaches of the Mat River, depicting the local inhabitants he saw and commenting that "these proud mountain folk did not and do not yield to severe nature, and in their age-long struggle with the difficulties have revealed the paths for a harmonious life together with the mountains. A harmony, which today gives them an opportunity to be useful to their socialist homeland."

DAILY COMMENTS ON TURKISH, CYPRIOT AFFAIRS

AU311901 [Editorial report] Sofia OTECHESTVEN FRONT in Bulgarian on 29 January 1986 carries three articles on Turkish affairs: on page 6, a 700-word article by Petur Prostranov entitled "Formula for Democratization;" also on page 6, a 700-word report of an undated interview given in Sofia by Turkish Cypriot Trade Union leaders to Rumen Kovachev, and entitled "Peace and Unity--This is Our Goal;" and on page 7, an approximately 800-word article by Dlacho Balbanov on the Armenian genocide entitled "The Truth About the Extermination."

Prostranov's article opens with the comment: "The return of Turkey to democracy has become a pressing necessity. This is the general conclusion of the political observers in Ankara in connection with the proposal of the True Path Party (TPP), which has given rise to many lively discussions, and without doubt for a long time it will remain in the center of Turkey's internal political life." Prostranov outlines the TPP's 30part formula for the restoration of democracy, noting the demand by TPP leader Dzhin Doruk [name as transliterated] for a new constitution: "Now Turkey is a military public, and no return to normal civic life is possible with the present constitution."

Prostranov reports that the TPP's proposals produced a response from the Democratic Left Party (DLP), whose leaders, after talks with the TPP, agreed on a joint campaign, on the agreed conditions that "the new constitution must not restrict political life either on the left or on the right, and that only military coups and all activities which hinder the expression of the people's will be banned."

According to Prostranov, the TPP's formula also produced a different reaction from the Social-Democratic Populist Party, [name as published] [SDPP], the leader of which, Gyurkan [name as transliterated], while praising the above initiative, "expressed doubt that a right-centrist and a social-democratic party could agree on a joint formula for democratization. Prostranov adds that the SDPP has also appointed its own commission' "to record a list of antidemocratic formulations" in all government legislation and organizations' rules, on the basis of which the party plans to submit numerous bills to parliament.

Prostranov concludes by commenting that both the formula and the list have received wide support from journalists and politicians, and that since the three parties together enjoy wide popular support, "without doubt we will be witnesses of a stormy internal political life, and certainly only exceptional events can eliminate from it the issue of the democratization of Turkey."

Rumen Kovachev's report is of an interview with Bayram Celik, general secretary of the Revolutionary Federation of Turkish Cypriot Trade Unions, and with Yusuf Akama, member of the federation's managing council, who are part of a delegation invited to Sofia by the Bulgarian machine-building workers' trade union, on the subject of the situation in Cyprus, "which has long attracted the appetite of the imperialists, due to its strategic location." According to Kovachev, Celik characterized the situation thus: "With every passing day the impasse in Cyprus increases. This is the fact to which the leaders of both communities are closing their eyes." Celik, according to Kovachev, said that only the UN could succeed in bringing order to the island.

Kovachev then asked about the federation's role, to which Akama replies that their young organization "is struggling to improve the labor conditions of the Turkish Cypriots, which show a constant deterioration," as demonstrated by living standard indexes. Furthermore, Kovachev reports that Akama said that their organization, in the interests of the working class, "is making a stand against the ideological and economic penetration of imperialism, which not only has turned the island into a threat to peace in this part of the world, but also is continually fueling antagonism" between the two communities.

When asked about the aims of the struggle, Kovachev reports that Celik stated: that "our aims are clear--to bring together the interests of the two communities,... to disclose the instigating efforts of imperialism,... to struggle for friendship and cooperation between the two sections of the Cypriot people, and to continue the struggle for peace and cooperation with other countries."

According to Kovachev, Celik concluded by stressing the significance for the Cypriot situation of 1986 being declared International Peace Year by the UN, noting "the great contribution which Bulgaria is making to peace in the region and throughout the world," and stating that "the leadership of the Bulgarian trade unions gives us a brilliant example of workers' solidarity."

Dalcho Balabanov's article concerns the publication in Turkey of articles "giving a distorted picture of the events connected with the Armenian genocide," intended, "as CUMHURIYET stated on 5 December 1985, to refute the 'version' of the extermination of a people with thousands of years of history." Balabanov finds remarkable the attempts to ignore historical truth, to assert, according to the articles, that the "so-called Armenian question arose not as the result of general genocide, but under pressure from the Great Powers--England, France, and Russia." Balabanov finds that "the Turkish bourgeois historiography" deliberately passes over in silence the fact that the Armenian question "arose not after the 1915 genocide, but much earlier." In support of this, Balabanov quotes Sultan Abdul Hamid's statement after the Berlin Congress that "in order to settle the issue, the Armenian people must be liquidated once and for all," and cites the well-known "directive" of the Turkish foreign minister Talyaat Pasha [name as transliterated], calling for extermination of the Armenians during World War I. Balabanov asserts that these "and many other documents preserved until our time completely refute the attempts of the contemporary Turkish falsifiers of history."

Balabanov continues by offering further historical evidence for his argument, such as Talyaat Pasha's telegrams concerning measures for Armenian genocide, which were sent during World War I to Naim Bey, secretary of the Aleppo Committee for Departation of Armenians, and presented to the publicist Adam Andonian, who published them in Paris in 1920, together with other evidence of genocide. Balabanov mentions cases of Turkish officials refusing to carry out anonymous, extermination orders, such as that of the Aleppo governor Jamal Bey. However, Balabanov notes that there are certain discrepancies in the documentary evidence given in individual editions of Andonian's book, which "'provide grounds' for certain Turkish researchers deliberately to reject the authenticity of the facts set out in the book." Balabanov points out that Western scholars are nonetheless convinced of the authenticity of the documents.

BCP LOCAL ACCOUNTABILITY-ELECTION CONFERENCE HELD

AU031255 [Editorial Report] Sofia RABOTNICHESKO DELO in Bulgarian on 31 January, as well as on 1 and 2 February 1986 carries reports from local correspondents on accountability-election conferences on provincial party organizations and of Sofia district party organizations, attended and addressed by various BCP Politburo members, candidate members and Central Committee secretaries.

RABOTNICHESKO DELO on 31 January carries on page 2, a 200-word report from Sofia by Elena Dimitrova, reporting on the accountability-election conference of the Sofia Vasil Levski Rayon, held at the "Georgi Kirkov" hall of the Party House and attended by Petur Mladenov, member of the BCP Central Committee Politburo and minister of foreign affairs, and by Georgi Georgiev, first secretary of the Sofia City BCP Committee. Petur Mladenov "pointed out that the decisions of the historical April plenum of the BCP were of decisive importance for the unrelenting and ascending development of the country" and stated that Vasil Levski Rayon is an example for this progress. Dimitrova continues: "Dwelling on unresolved problems and on certain existing shortcomings, he expressed confidence that the efforts of the rayon party organization will be devoted to the solution of the crucial problem--the acceleration of scientific-technical progress and the worthy preparation of the 13th BCP Congress."

The same issue on the same page carries a 150-word report by Vanyo Stoilov on the Turgovishte Okrug party organization accountability-election conference, attended by Georgi Yordanov, candidate member of the BCP Central Committee Politburo and chairman of the Council of Science, Culture, and Education at the Council of Ministers, as well as by Evtim Krustev, first secretary of the Okrug BCP Committee. Georgi Yordanov is reported as speaking on the importance of "scientific-technical upsurge and intellectual progress."

The same issue on the same page carries a 200-word report by Mikhayl Kulishev from Smolyan, describing the Okrug BCP Organization's accountability-election conference attended by Petur Dyulgerov, candidate member of the BCP Central Committee Politburo and chairman of the Bulgarian Trade Union's Central Council, and by Atanas Atanasov, first secretary of the Smolyan Okrug BCP Committee. Petur Dyulgerov is reported as "evaluating the positive work of the communists in the Smolyan municipality in all sectors of accelerated socioeconomic development and the successes achieved in the revival process which was adopted by the population."

The same daily on the same page carries a 120-word report by Stanislav Kolev from Kazunluk, reporting on the Okrug BCP Organization accountability-election meeting attended by Peko Takovgn deputy chairman of the State Council who spoke on local successes, and by Mincho Yovchev, first secretary of the BCP Okrug Committee.

Sofia RABOTNICHESKO DELO on 1 February carries on page 6 several reports on local party accountability-election conferences held on 31 January. A 150-word report by Dilyan Todorov deals with the Sofia "Kolarov" rayon accountability-election conference, politburo member and [word indistinct] civic committee, and by Georgi Georgievod of the Sofia City BCP Committee. Aleksandrov is reported as expressing satisfaction at the achievements of the Kolarov Rayon communists. A 100-word report from Lovech by Nedyalko Atanasov, deals with the Lovech Okrug BCP Organization's accountability-election conference, attended by Georgi Atanasov, candidate member of the Politburo and secretary of the BCP Central Committee, and by Petur Balevski, first secretary of the okrug BCP committee.

A 150-word report by Maksim Behar deals with the Shumen Okrug BCP organization accountability-election conference, attended by Stoyan Karadzhov, chairman of the BCP Central Control-Auditing commission, and by Georgi Nachev, first secretary of the Shumen okrug BCP Committee. A 150-word report by Nikolay Zhelev deals with the Tolbukhin Okrug BCP Organization accountability-election conference attended by Stoyan Mikhaylov, secretary of the BCP Central Committee, who spoke on "ideological-educational" matters, and by Dimitir Dimitrov, first secretary of the Tolbukhin Okrug BPC Committee. A 100-word report by Maria Marcheva describes the Yambol Okrug BCP Organization's accountability-election conference, attended by Vasile Tsanov, secretary of the BCP Central Committee, and by Ivan Ovcharov, first secretary of the Uambol Okrug BCP committee. Vasil Tsanov is cited as stating that "lofty goals and criteria such as those pointed out by the 1985 February and the 1986 January plenums of the BCP Central Committee can be achieved only through revolutionary changes at the base, as well as in the superstructure."

Sofia RABOTNICHESKO DELO on 2 February carries on page 2, a 300-word report by Nikola Ganchovski, local correspondent from Kremikovtsi on the accountability-election conference of the Kremikovtsi rayon party organization, held on 1 February at the Sofia "Georgi Kirkov" hall. The conference was attended by Ognyan Doynov, member of the BCP Central Committee Politburo and secretary of the BCP Central Committee, chairman of the Economic Council at the Council of Ministers, and minister of machine building industry, and by Georgi Georgiev, first secretary of the Sofia City BCP Committee. Doynov is reported as speaking on local successes of Kremikovtsi and on "certain shortcomings," without further specifying them.

All accountability-election meetings described in the aforementioned reports deal with local working people's achievements. No significant shortcomings are pointed out in the speeches of the aforementioned leaders attending the conferences.

No changes in personnel or leadership of the local party organizations are mentioned.

CASES OF ALCOHOL ADDICTION DESCRIBED

AU031513 [Editorial Report] Sofia TRUD in Bulgarian on 1 February, on page 2 carries a 1,400-word article by Nikolay Gavrilov, entitled "Visa to Nowhere...." It is published under the rubric "February--the Month of Temperance," which also contains a 600-word article by Tsanka Konstaninova, deputy chairman of the National Committee on Temperance, entitled "With Optimism Toward the Great Goal," dealing in general terms with the importance of temperance.

Gavrilov's article describes his visit to the Sukhindol Fourth Psychiatric Clinic for Drug and Alcohol Addicts, and his conversations with Docent Filip Lazarov, one of the doctors of the clinic, and two unnamed patients, both alcoholics.

Gavrilov reports Lazarov as having told him, among other things, that "some 150 persons, 25 of whom are female, are being treated at the clinic," that he "is concerned with the increased percentage of young people" among his patients, and that "there is only a small percentage of drug addicts in the clinic."

"The problem of alcoholism has recently become ever more alarming," Lazarov is reported as saying. "People are drinking too much because of daily social and psychological conventions, and the 'game' with the glass has become a painful style of human life in which man loses his functions--psychological, physical, and social functions."

Gavrilov describes his conversation with an unnamed patient, a television technician, who, he says "has been abusing alcohol for the past 20 years" and "had spent several years in an Arab country," so that money was not a problem for him. The result, Gavrilov notes, is that the patient was drinking three bottles of hard liquor a day.

Describing his conversation with the second patient, a medical assistant, Gavrilov notes that the patient began to drink at high school "and afterward in the army." "Before coming to the Sukhindol clinic he had been treated in a similar institution in Radnevo."

After describing the poor physical condition of these patients and giving a pessimistic prognosis for them, Gavrilov concludes:

"People with lost hopes and old remorses, and faces marked by the most cruel sculpter, alcohol, remained there in the forest. They have their visa to nowhere, which, unfortunately, can be issued to anyone and not just to a select few. Think about it!"

EFFORTS TO RESTORE ESSENTIAL RURAL SERVICES

AU061432 [Editorial Report] Sofia RABOTNICHESKO DELO in Bulgarian on 5 February 1986 carries on page 8 under the rubric "Days and Nights Against the Snowstorms" a collection of reports, all dated 4 February, from okrugs on the intense efforts to restore essential rural services. These comprise a 450-word article by RABOTNICHESKO DELO correspondent Mariya Marcheva from Yambol, a 400-word report by the daily's correspondent Vanyo Stoilov from Turgovishte, and two shorter unattributed reports from the newspaper's Khaskovo and Stara Zagora correspondents.

The Yambol report, entitled "A Brave Struggle," begins as follows: "On the third day there is no pause in the intense work under the leadership of the okrug staff to restore the normal rhythm of life in the okrug, disrupted by the snowstorm." Marcheva notes that all main road routes have been reopened to traffic, but local routes still have to be cleared. She continues: "The road transportation combine has managed to transport milk from all farms in the okrug, and in the morning people in most villages will receive fresh milk and yogurt."

Marcheva then notes that "now the main task remaining for the emergency teams from the electricity supply organization... is to restore the medium- and low-voltage lines and to supply more than 80 villages with electric power." In the town of Yambol intense snowclearing operations continue. Marcheva reports that "hundreds of kilometers of roads have been cleared, tens of kilometers widened to normal capacity--this is the result of the collective's work of the previous day. In the okrug road administration's control room information is updated literally every hour."

Vanyo Stoilov reports from the control room of the electricity services division in Turgovishte on the selfless labor of electrical fitters who "walk along the 1.5 kilometer line meter by meter amid the fields in order to locate the fault." He quotes the division's director as saying: "We immediately formed 12 emergency teams, who by the evening of Tuesday 4 February restored power everywhere." Stoilov then gives a report from the Turgovoshte okrug road administration that "the basic road network is passable under winter conditions, but certain sections have still to be widened and sanded." Petur Karageorgiev, deputy chairman of the Turgovishte Okrug People's Council informed Stoilov that "Tomorrow will already be a normal working day."

The unattributed report from Khaskovo states that the snowfall "as well as bringing long-awaited life-giving water, has also caused some difficulties to the people. The snowfall and wind caused four main electricity power lines to be cut and 103 others to be damaged.

Over 100 villages were left without electric power." However, "as a result of the timely measures adopted, the faults are gradually being eliminated in the electricity supply and in the clearing of the main and secondary roads." The Stara Zagora report states that "the heavy snowfall has seriously hampered the normal rhythm of life in the okrug, and put both people and equipment to the test." However, thanks to round-the-clock efforts "the rhythm of life in the okrug is gradually returning to normal."

ARMY DAILY VIEWS 'TEAM SPIRIT--'86' MANEUVERS

AU121951 Sofia NARODNA ARMIYA in Bulgarian 8 Feb 86 p 6

[Senior Lieutenant Ivan Genov article under the 'Weekly International Review' rubric: "Talks and Maneuvers--Two Incompatible Concepts"]

[Text] On the eve of the joint U.S.-South Korean maneuvers "Team Spirit--'86" the reluctance of official Washington, and especially the Pentagon, to depart from the wellworn track of threat of force in the regional conflicts which they themselves have fomented is evident with particular clarity. The maneuvers are due to commence on 10 February. A vast 200,000-strong army with 1,000 aircraft and other fighting equipment is assembling to take part in the maneuvers south of the 38th parallel. Last year's "Team Spirit--'85" maneuvers are remembered as the longest military exercises carried out since World War II. Their organizers gave it the names of a "preventive strike," "initial war" [vstupitelna voyna], and "experimental nuclear war." It is difficult to say what label will be attached to this year's version, but one thing is clear--its sharp end will once again be aimed northward, at the PDRK.

Everyone knows of the DPRK's decision of 1 February 1986 not to organize large-scale maneuvers and to cease all kinds of large military exercises during the negotiations between the North and the South, a decision intended to assist the peaceful unification of the artificially divided Korean peninsula.

One could hardly expect a positive reaction on the part of Washington. In the Pentagon's plans, South Korea figures as a convenient launching platform for aggression not only against the DPRK, and Seoul also plays the role of an inciter of tension in this region of the world. On 18 January the United States confirmed its decision to take part in the "Team Spirit--86" maneuvers, thus sabotaging the negotiations between the North and South.

On the DPRK's side it was correctly pointed out that to sit down at the negotiating table and at the same time to foment war hysteria is in contradiction of elementary logic. It was therefore stressed that the DPRK is compelled to continue the talks only after the large-scale maneuvers of the United States and South Korea have been completed.

The political anachronism of supporting the existence of "two Koreas" has irretrievably outlived its time, and the United States will hardly manage to rejuvenate the concept with such militaristic preventive measures as the "Team Spirit--86" maneuvers. The effect will rather be the reverse--a powerful wave of protest in the South and increased revolutionary vigilance in the North.

POWER ENGINEERING MINISTER ON POWER SUPPLY

AU101357 Sofia BTA in English 1048 GMT 10 Feb 86

[Text] Sofia, 10 Feb (BTA)--In a number of indices in the field of power engineering Bulgaria ranks among the most advanced industrial countries in the world, Mr. Nikola Todoriev, minister of power engineering said. In an article published today in RABOTNICHESKO DELO he notes that the consumption of electric power per capita of the population is more than 2.5 times higher than the world's average. The minister stressed the following fact: The structure of power generation contains the characteristic features of the most progressive tendencies in this field which find expression in the great relative share of the nuclear capacities in power generation and in the great amount of electricity generated from low calory fuel.

Mr Nikola Todoriev pointed out that today the nuclear capacities generate about 1/3 of the electric power in Bulgaria. There are four 440 megawatt reactors at the Kozloduy nuclear power station. Yet another two reactors, 1,000 megawatt each, are now under construction at accelerated rates at the same power station. The construction of a second nuclear-power station has started near the town of Belene (on the Danube). The minister of power engineering stressed that Bulgaria is the second country in the socialist community after the Soviet Union in which 1,000 megawatt nuclear reactors are under construction. Bulgaria's experience as regards the terms of the setting on stream of the nuclear capacities and as regares the terms of their mastering places here among the most advanced countries in the world. The minister cites an interesting fact: If the average coefficient of the utilization of the nuclear reactors in the world is 62 at the Kozlodui nuclear power station it is 80 percent.

Mr Nikola Todoriev writes that it has been provided for the development of a new trend in nuclear power generation--central heating on the basis of nuclear sources.

The minister said that 30 years ago the most powerful energy blocks were 25 megawatts. Now the power engineering system in this country includes six energy blocks, 150 megawatts each and 15 energy blocks, 210 megawatts each. The "Varna" thermo-electric power station has a capacity of 1,260 megawatts and the "Maritsa Iztok" complex generates 20 percent of the electric power in Bulgaria. At "Maritsa-Izstok" there have been introduced efficient technologies for the direct burning of low-calorie coal in thermoelectric power stations.

Bulgaria's minister of power engineering dwells on the mining of coal in this country. Eighty percent of the coal in this country is mined in open cast mines. In the following few years 87 percent of the coal will be mined according to this method. At the same time the necessary attention is being paid to the mining of brown and other types of coal. These types of coal are mined underground.

Mr Nikola Todoriev also dwelled on some unresolved problems in the field of power engineering. Bulgaria is still lagging behind in a trend as important as the rational use of fuels and energy and the raising of the energy efficiency of the economy. The consumption of fuels and energy per unit of production in this country is still high.

By way of conclusion the Bulgarian minister of power engineering comments on last year's difficulties in power supply. He stressed that the state is providing the necessary resources with which to compensate the lack of water resources for achievinv the energy balance and that the disturbances will be gradually overcome.

BRIEFS

ZHIVKOV RECEIVES KUWAITI AMBASSADOR--Sofia, 13 Feb (BTA)--Today State Council President Todor Zhivkov received the newly appointed Ambassador of Kuwait to Bulgaria Mr Talib Jalal ad-Din al-Nakib, who presented his credentials to him. Mr Todor Zhivkov stressed the readiness and the wish of Bulgaria to promote and consolidate the friendly relations and mutually advantageous cooperation between the two countries in different spheres. He said that Bulgaria will continue to render support to the Arab peoples for a just and lasting resolution of the Middle East conflict. On his part the ambassador of Kuwait stressed Bulgaria's great merits and its friendly attitude to the just cause of the Arab peoples in particular. In Kuwait we appreciate and respect these activities, he said. The ambassador of Kuwait expressed the wish of his country to cement its friendly relations with Bulgaria. NATIONAL ASSEMBLY LEGISLATION COMMISSION--A meeting of the Legislation Commission was convened at the National Assembly. Under the leadership of Yaroslav Radev, the commission's chairman, the National Assembly deputies discussed the work of the commission during the past 1981-85 period. The meeting was attended by Comrade Stanko Todorov. It was pointed out that the Legislation Commission's activities are developing in three main directions: supporting the legislative activities of the National Assembly; exercising control upon the efficiency in implementing laws; and cooperation with the work of the organs for law and order. Within a period of less than 5 years, 51 draft laws were reviewed and 14 checks were carried in connection with the application of laws with great social importance. The considerable role of the Legislation Commission in connection with adopting several laws--were made--was pointed out. [Text] [Sofia Domestic Service in Bulgarian 1000 GMT 14 Feb 86 AU] /9738

POLITICS HUNGARY

LEGITIMACY OF REGIME PROBED, CALLED FOR

Budapest TARSADALMI SZEMLE in Hungarian No 12, Dec 1985, pp 83-88

[Article by Josef Bayer, Candidate and Senior Member of the MSZMP CC Social Sciences Institute: "Legitimacy and Consensus"]

[Text] Legitimacy is a norm of political philosophy which expresses recognition, validity and legality of any political power. Legitimation is the process of the creation of legitimacy, it is a way to the recognition of a political regime. Both terms bear the stigma of professional phraseology; recently their fashionable colloquial use, aside from making an affected impression, also blurs their specific meaning. (We now try to legitimate many things that we had thus far motivated, explained, justified, etc.)

In the vocabulary of classic Marxism--from which emphasis on the ideological dimension of class-rule is never missing--none of these terms have ever played a role. In their current interpretation they acquired popularity only as a result of Max Weber's teaching, and they reached us primarily in the 1960s and 1970s as a result of Western political science discussions about the "legitimacy crisis" of capitalism. Meanwhile the various standpoints blended into theories and recently they have also been used for the analysis of the political system of socialist countries.

The question arises: do the legitimacy theories provide us with such an original theoretical and methodological viewpoint that may enrich our knowledge about the functions of a political system? According to the Marxist political scientist G. Therborn, this is only in part true since although these theories are pointing to important problems, however, they pose questions with a false framework. They are neither empirical nor analytical conceptions, but normative, i.e. the system should be legitimate and the way it should be so, this is their main problem, rather than the analysis of the real functions of political power. Although they place emphasis on the role of ideology in the functioning and maintenance of political power, they are often interpreting the concrete functions of ideology in a lopsided and idealist manner.

Among Marxists it is generally accepted that no class rule can prevail in the long run without ideological support. For it is possible to rule for a short time by using brute force (for example over slaves), yet the specific practice and internal structure of a ruling class eventually requires ideological justification. According to Max Weber, in the first place it is just the latter, the relationship between the ruling person or group and their "staff" which is the decisive factor in the definition of the various types of legitimacy. Thus from the definition of legitimacy the problem of class-rule disappears and the "pure" political power, that is detached from the remaking of class relations, tends to become the objective of ideological justification.

Power it is known, is a two-sided reflective relationship. A king is only made a king but his relationship to his subordinates. Thus no regime can function without a certain degree of recognition by its subjects, by their obedience and "consensus." This may be motivated by a variety of things, the scale of which extends from forcible submission to the brute physical force to resignation resulting from the feeling of helplessness, which leads through the momentum of habit to voluntary followership and even to enthusiastic and active support. Thence legitimate is considered to be a regime that is not based on brute force alone, instead its subjects voluntarily and inwardly accept it and on some kind of general ideological basis recognize it as justified and lawful, and therefore they follow its command willingly with an obedience rooted in their own interests. Thus legitimacy is often and rightly considered a condition of lasting and stable power.

With bayonets much can be done, only it is impossible to sit on them. This much cited vitriolic saying by Talleyrand is a warning for every "new prince" who has to create his own legitimacy if he wants to establish a lasting rule.

Thus in this abstract sense legitimacy was born at the same time as political rule, even if it has taken various forms during changing eras. Obviously it becomes a problem in people's consciousness at the time of great changes in power relations and principally during the chaotic periods of system changes. The concept has been used since times immemorial, not only in its stricter family law interpretation (the legitimate or lawful child as the rightful heir), but also in a wider political sense arising from this, as the principle of dynastic legitimacy versus tyranny and usurpation of the throne.

Real history or political science nevertheless starts with the Restauration Period that followed the great French Revolution and the Napoleonic wars. The power of the Holy Alliance set the feudal principle of dynastic, historic legitimacy against the concept of people's sovereignty, from which the legitimacy of bourgeois constitutions was derived. The "legitimists," believers in the reign by grace of God and exercised on the basis of "historic rights," have almost expropriated this concept. Therefore the bourgeoisie, in struggle for its ascendance, preferred the use of the concept of legality, when it wanted to emphasize its justification of its rule. Legality became a synonym of "rational" rule, that has been established by laws made by the people's representatives. As a result of the eclipse of this historic contradiction, it was later nonetheless legitimacy which gained more general acceptance, particularly in the wake of Max Weber's teaching, who gave a more general interpretation to this concept. However legality, the safeguarding of formal lawfulness has remained until now one of the most important mainstays and conditions of legitimate rule.

According to Max Weber the state is a condition of dominance, based on the use of legitimate (lawful) force, and it cannot subsist without the acceptance of its authority. Why do people obey? Of course to some extent under external compelling causes which provoke fear and nurture hope, as well as because of their own various interests. Moreover also on the basis of internal processes of justification and faith in the lawfulness of their submission. Every regime tries to create and nurture this kind of faith.

The three models of legitimate rule are: the traditional, the legal and the charismatic rule. The traditional rule relies on the authority of the "eternal past," on the conventional faith in "the sanctity of traditions, which have been valid since time immemorial and in the legitimacy of people whose authority is rooted in them." The basis of legal rule is rationality, "the faith in lawful order and in the right of command of those people who have been put in charge by it of exercising its rule." The justifications of charismatic rule are the extraordinary abilities of a person, his (her) holiness, heroism and devotion to his (her) vocation. The first model essentially corresponds to the personal and the second to the material pattern of dependence relations (in the Marxist terminology), while the third points at the irrational, personal and confidential relationship with the leader, that may be the peculiarity of exceptional historic conditions. All three have different types of "following," ruling body: the first has patrimonial aristocracy (feudal type of body), the second bureaucracy and the third "experiment."

This concept is still considered fundamental in political science literature, although it has also been widely criticized. The ideal types of Max Weber revolve around the philosophy of history. The differences between traditional and legal rule reflect basically the differences between pre-capitalist and capitalist systems (the prospect of a new system does not yet appear in Weber's work; he views socialism merely as a new degree of progressive rationalism). On the other hand the often disucssed and misinterpreted model of charismatic rule is a phenomenon on transitional, eventful and critical periods of time.

However within this generality none of them is suitable to describe any concrete political system. Thus its critics have often introduced other, more concrete principles of legitimation, which seem to be more useful. The concepts of people's sovereignty and constitutional state are today indispensable elements of the legitimacy of any political system; they are usually complemented by the procedural rules of democracy (elections, the principle of majority rule, etc.), by the idea of nationality and a series of other positive political values. Recently the non-formal, material principles have acquired major emphasis. Thus the state and government system of modern "welfare capitalism" is primarily justified by its effective compliance with its welfare functions, other principles of legitimation functioning only as subordinate elements. In a more vulgarized form this has been defined in the term of "legitimation by means of consumption," whereby we have by and large left the sublime level of normative justification. The material interests, which have so far been washed out from the ideology, now break nonetheless, in a sobering way, into the ideology and promptly acquire a domineering role. Max Weber would have certainly not listed them among the factors of legitimacy, but would have counted them as other motives of obedience.

In the 1960s and 1970s, mainly in the tumults of the student movements, polemics started among leftist theoreticians on the legitimacy crisis of the capitalist state. (These polemics were interesting and from many other viewpoints also instructive, yet their hypotheses concerning a legitimacy crisis have not been vindicated by time; they rather reflected their authors' ideological reorientation. Of course the accusation of their rightist adversaries that precisely the leftist crisis theoreticians were those who provoked a sort of legitimacy crisis, has not been justified either). In the course of the discussions the normative character of legitimacy acquired new momentum to the detriment of the psychological motives behind the acceptance of a rule. J. Habermas criticized the hidden positivism of Weber's conception, i.e. the identification of faith in legitimacy with legitimacy itself. The empirical recognition of a regime is in his opinion not equivalent to its legitimacy.

Legitimacy means that a political order is worthy to be recognized by its subjects. This requires such deeper motives for the acceptance of a regime which express historic justice. However such justifying principles would nowadays challenge the latent class structure of the capitalist system and its social inequalities, and this is in part the root of the legitimacy crisis. Another cause is the gradual disintegration of the traditional social norms, or in other words the preference granted to "system integration," which rests entirely on efficiency principles, to the detriment of "social integration;" all these running parallel with the growing expectations from the intervening welfare state. Nevertheless there is no danger of a general crisis in the system, since the crises perceptible in some areas of society do not add up, it has thus far been possible to isolate them from each other.

Taking issue with the normative dimension, other people rather emphasize the legitimating role of the procedures, which are attached to the institutions. Their point of reference is that people are simply not in a situation to question the norms enshrined in the institutional procedures which determine to a great extend and restrict their behavior.

There is no lack of theoretical interpretations in the legitimacy literature. Moreover there are also empirical research projects under way, which try to assess the acceptance of certain political values and to ascertain the degree of consensus reached in them. The question is, can these findings be interpreted as evidence of legitimacy, since the possibility that they are unreliable comes usually to light unexpectedly and "post festum," and cannot be grappled by means of questionnaires. Legitimacy itself is a qualitative category and therefore it can hardly be measured. With empirical methods only certain political attitudes can be tested, of which we presume that they have something to do with the stability or instability of the political system and are playing a role in the acceptance or questioning of that system. However, a political system may be stable without being legitimate, since obedience may be and in fact is motivated also by other things, and the reverse is also true. Moreover it is also questionable whether legitimacy stands in relation to the fundaments of a social system or only to the ways in which power is being used.

If there are so many questions concerning legitimacy, what is the point in raising the problem? Well, there are certain viewpoints from which its posing seems to be rational and instructive. One of them is the change in the justification structure of a political system, which brings with itself a radical system change. Thus revolutions usually to not topple legitimate orders but only such ones whose legitimacy has already been undermined and disintegrated. Revolutions--in contrast with usurpations of power and coups d'Etat--carry in themselves the principle of their legitimacy, that the revolutionary power unfolds and brings to fruition in its entire institutional system and ideology. It is interesting to note that Gyorgy Lukacs, in an article entitled "Legality and Illegality" that he wrote in 1920, and which was published in TORTENELEM ES OSZTALYONTUDAT in 1923, raises categorically and as a decisive question the problem of the creation of legitimacy by revolutionary powers.

For the process of legitimation runs through a twofold channel: aside from the recognition and support from below--which is difficult to scientifically ascertain, yet politically is all the more perceptible--its "production" and creation from above is also feasible. In the stage of the building of a new legitimacy the latter is certainly the decisive and active factor. The shaping of the entire spiritual physionomy of the new order may be conceived as the process of legitimation. This encompasses the entire pattern of socialization--from the traditional educational institutions to the activities of the new political organizations in that area--as well as the entire organization of mass communication, arts and sciences, including the ideology of the political elite itself. Those Western politicians who undertook an in-depth analysis of the political system of the Soviet Union from this specific point of view--regardless of their political value judgment--reached the conclusion that the new Soviet system had created and gained its own legitimacy.

The evolution of "consensus" from below, even if it is not of secondary importance in this process, it is in its accommodation with the prevailing combination of "compulsion and persuasion" not autonomous. It can only later become autonomous and a spontaneous and organic reproduction of legitimacy from below can only then unfold. This process is far from being harmonious and exempt from contradictions; it is often beset with crises, above all in case the new regime has an underdeveloped class basis, which also determines the rigidity of the political structures. The making of a "natural" renewal mechanism of consensus is in final analysis--among other factors--an indispensable condition of lasting legitimacy. Its adequate structures can only be worked out through reforms and a series of corrections and cannot be provided a priori.

Legitimacy is often built upon such a consensus theory that is based on unrealistic premises. Consensus has notably various, but a least two fundamental meanings, the difference of which is translated in the English language by the terms consent and consensus. The first means acquiescence in and concurrence to something, the other agreement with something. legitimacy is often defined as an agreement between the values accepted by the population and those of the ruling elite. Aside from the fact that in this interpretation the two meanings of consensus are intermingled, the question arises: How can this agreement be reached? According to the prevailing hypothesis the "bourgeois society" grants its consensus and mandate to such a regime--and only to such one--with whose principles of functioning it agrees. This is the ideal model of democratic legitimacy which is being built from below and that nowadays no regime can disregard. Regimes are going their best to obtain at least the appearance of it. Political science begins however where the real political process is not being confused with its justification....

This does not mean that consensus has no important role in legitimation. The matter however is that consensus itself is as fragmented as the entire political structure, that the entire political system cooperates in its recreation, and the mechanism of its development depends on the entire system of interest transmission. In Gramsci's Marxist political theory this is for example reflected in his treating the "bourgeois society" as part of the superstructure. On the other hand Althusser and his followers are speaking about "ideological state apparatus" when analyzing the mechanism of "consensus" making.

If consensus is fragmented, it is obvious that the individual groups have no identical clout from the point of view of legitimation. On the other hand it is an even more important fact that consensus coexists with dissent, the trend and character of which is indeed the crucial question of legitimacy. According to the already cited author, G. Therborn, it is not so much mass discontent, let alone illegal activities or the spread of protest movements which by themselves threaten legitimacy. The crucial test is the appearance of organized challenge to legitimacy and--in case of trial--its impact on the loyalty of the ruling apparatus and its ability to function. Such a challenge differs conclusively from sheer dissent, protest and break of law, it amounts to an alternative and enshrines the promise of a new law.

Such a challenge may be presented by non-governmental revolutionary (or even counter-revolutionary) organizations, or by some fractions of the ruling apparatus, which thereby disorganize the legitimacy of the regime. This concept contradicts the static ideas of the loss of legitimacy. Diffuse and disorganized discontent, skepticism and cynicism alone do not provoke legitimacy crisis, notes Therborn, who supports his assumption with historic examples. All this does not amount, in his opinion, to a negation of the role of the masses, only it provides a more realistic picture about the real functioning of political power. As he observes, dictatorships do not fall because they are unpopular, but as a result of a change in the balance of forces. An important element of this is the internal disintegration process of the ruling elite, as a consequence of which the popular forces can thrust into the political scene and can play their historic role.

....

As we see, the analysis of the legitimacy problem sheds light on interesting aspects of the role of ideology. We should also exactly specify what we are speaking about; is our topic the legitimacy of the social system, the political structure or only that of the government? These various levels are often interchanged and this is particularly risky in cases where the monolithical unity of a political system dominates. In such cases a possible destabilization caused by the mistakes of the government's policy might at once appear as the legitimacy crisis of the entire political and even social system. And it may turn into a crisis, if an ideological erosion starts also within the ruling apparatus, since there is no possibility of solving the arising conflicts by internal moves, or establishing the new ideological and action unity required for the corrections. The history of the internal crises of the East European socialist countries may be enlightening from this point of view. The internal crisis of the party and the paralysis in its capacity of action have always been crucial factors of the deepening of these crises.

Conversely Western political scientists constantly wonder how it is possible that the socialist system, after an apparently deep and in all its symptoms real "legitimacy crisis," consolidates itself quickly and relatively easily, and that the socialist regimes, which are presented by Western propaganda as unstable, appear to be stable in reality. The explanation of this rests of course in the specifics of the entire social system, its conditions of production and in the institutional and intellectual fabric of its superstructure.

All this, together with the desire for renewal of the leading party and the reform capacity of society points to the fact that our system has large "legitimacy reserves." Of course the norm of legitimacy may be approached from various angles and it will always be a topic of political argument. Nobody should expect from Otto Habsburg that he consider our regime as legitimate, but also our more immediate adversaries may question the legitimacy of our system; it suffices that they respect its legality.

Legitimacy is always relative, the principles of legitimacy can of course only comply with their function within some kind of comparative pattern, the test being either the past of the challenge of a present competitor. The time factor plays certainly a great role in the stabilization of legitimacy. The various periods of the political takeover of socialism show changing justification structures. The current economic and political challenges to our system are provoking new tensions, the productive and forward pointing solution of which requires also ideological renewal and must create at the same time a new type of legitimation. The exploitation of the mentioned "legitimacy reserves" is therefore important, although it is hardly a scientific or ideological task alone. It can only be the result of joined social and political efforts.

CHANGES IN ORGANIZATION, JURISDICTION OF GOVERNMENT AGENCIES

Warsaw DZIENNIK USTAW in Polish 12 Nov 85 pp 665-667

[Text] Law 262 dated 12 November 1985 on changes in organization and jurisdiction of certain chief and central organs of state administration]

In order to:

--create better conditions for the functioning of chief and central organs of state administration and improve their organization,

--further apply economic reform,

--comprehensively solve important social problems,

--decentralize the state administration and manage the national economy

and in accordance with proposals submitted at meetings prior to elections to the Sejm of the Polish People's Republic, it is proclaimed as follows:

Article 1. 1. An office of Minister of Construction, Land-Use and Municipal Management is established.

2. The jurisdiction of the Minister of Construction, Land-Use and Municipal Management encompasses matters formerly under the jurisdiction of the Minister of Construction and Construction Materials Industry and the Minister of Administration and Land-Use Management, except as provided in Article 7 paragraph 2 and Article 8 paragraph 1 and 3, and particularly matters relating to:

1) town and regional land-use management plans,

2) land management,

3) construction,

4) housing construction and repair of buildings and houses,

5) town planning, architecture and building supervision,
6) construction materials industry,

7) production of specialized machinery and equipment for construction and the construction materials industry,

8) municipal management and its repair facilities and the municipal equipment industry,

9) geodesy and cartography.

3. The Minister of Construction, Land-Use and Municipal Management executes tasks relating to geodesy and cartography through the Main Office for Geodesy and Cartography.

Article 2. 1. An office of Minister of Agriculture, Forestry and Food Economy is established.

2. The Minister of Agriculture, Forestry and Food Economy has jurisdiction over matters formerly under the jurisdiction of the Minister of Agriculture and Food Economy and the Minister of Forestry and Timber Industry, except as provided in Article 3, paragraph 3 and Article 8 paragraph 2, and particularly matters relating to:

1) agriculture, seed and breeding production,

2) plant and animal protection,

3) farmland management and protection,

4) forestry management and protection of forests,

5) agri-food processing,

6) processing of timber and other forestry products,

7) procurement of farm and forestry products,

8) land reclamation and installation of water pipelines to agriculture and the countryside,

9) mechanization of agriculture and production of specialized machinery and equipment for agriculture, forestry and the food industry,

10) geodesic services for agriculture and forestry,

11) hunting.

Article 3. 1. An office of Minister of Environmental Protection and Natural Resources is established.

2. The Minister of Environmental Protection and Natural Resources has jurisdiction over matters formerly under the jurisdiction of the Office of Environmental Protection and Water Management and the Central Office of Geology, and particularly matters relating to:

1) protection and shaping of the environment,

2) water management and flood prevention,

3) protection of natural resources,

4) inland waterways,

5) metereology and hydrology,

6) geology.

3. In addition, the Minister of Environmental Protection and Natural Resources has jurisdiction over matters of natural environment formerly under the jurisdiction of the Minister of Forestry and Timber Industry.

4. The Minister of Environmental Protection and Natural Resources executes tasks of the chief organ of state administration relating to geology with the assistance of the Chief Geologist.

Article 4. 1. An office of Minister of Materials and Fuels Management is established.

2. The Minister of Materials and Fuels Management has jurisdiction over matters formerly under the jurisdiction of the Minister of Materials Management and the Main Inspectorate for Energy Management, and particularly matters relating to:

1) management of raw and other materials, fuels and energy, and their stocks,

2) control over observance of principles of efficient management of raw and other materials, fuels and energy,

3) use of fixed assets in the national economy,

4) state reserves,

5) warehouse management,

6) management of packaging, secondary raw materials, and defective materials.

3. The Minister of Materials and Fuels Management executes the tasks of the chief organ of state administration relating to control of the fuels-energy economy with the assistance of the Main Inspectorate for Energy Management.

Article 5. Matters formerly under the jurisdiction of the Minister for Price Affairs now pass to the jurisdiction of the Minister of Finances.

Article 6. 1. A Main Committee for Physical Culture and Tourism is established.

2. The Main Committee for Physical Culture and Tourism has jurisdiction over matters formerly under the jurisdiction of the Main Committee for Physical Culture and Sports, and particularly in relation to popularizing, organizing and supporting the development of:

1) physical culture and sports,

2) tourism and rest,

3) physical culture, sports, tourism and rest facilities.

3. The chairman of the Main Committee for Physical Culture and Tourism is the central organ of state administration for matters relating to physical culture, sports, tourism and rest. The chairman, appointed, dismissed and supervised by the Chairman of the Council of Ministers, directs the activities of the Main Committee for Physical Culture and Tourism.

4. The Main Committee for Physical Culture and Tourism is also comprised of the deputy chairman and members of the Committee, appointed and dismissed by the Chairman of the Council of Ministers at the proposal of the Committee chairman.

Article 7. 1. The office of the Council of Ministers is called upon to:

1) define the principles of the organization and functioning of state-administration offices,

2) coordinate the implementation of personnel policies in the state administration.

3) conduct personnel matters on persons occupying leadership positions in the state administration,

4) organize the government's legislative activities,

5) control the execution of tasks assigned by the Council of Ministers and the Chairman of the Council of Ministers,

6) coordinate the control activities of the chief and central organs of state administration.

7) establish the rules for managing government real estate at the disposal of the state administration organs,

8) provide organizational, legal and office services for the work of the government.

2. The following matters, formerly under the jurisdiction of the Minister of Administration and Land-Use Management, now pass to the jurisdiction of the Office of the Council of Ministers:

1) supervision over the current activities of the local organs of state administration, in accordance with provisions of the law on a system of people's councils and territorial self-government,

2) coordination and control of activities of local organs of state administration and their organization and functioning,

3) the making of comprehensive analyses and evaluations of the activities of local organs of state administrataion and the results of these activities,

4) execution, with the cooperation of pertinent organs and organizations, of comprehensive control over provinces.

3. The Office of the Council of Ministers is directed by the Minister-Chief of the Office of the Council of Ministers, appointed and dismissed in accordance with the provisions of Article 37 paragraphl of the Constitution of the Polish People's Republic.

4. The Minister-Chief of the Office of the Council of Ministers executes tasks envisaged in the law on a system of people's councils and territorial self=government for the minister pertinent to administrative matters.

5. The detailed scope of activity of the Minister-Chief of the Office of Council of Ministers and the procedures for conducting inspections are defined by the Council of Ministers by way of an ordinance.

6. The organization of the Office of the Council of Ministers is established by statute conferred by the Council of Ministers.

Article 8. 1. Matters of local transportation, roads and transport, formerly under the jurisdiction of the Minister of Administration and Land-Use Management, now pass to the jurisdiction of the Minister of Transportation.

2. Matters of secondary and specialized processing of timber raw materials, formerly under the jurisdiction of the Minister of Forestry and Timber Industry, now pass to the jurisdiction of the Minister of Chemical and Light Industry.

3. Supervision over the functioning of sobering-up places is assigned to the Minister of Health and Social Welfare.

Article 9. 1. The following are eliminated:

1) the office of the Minister of Construction and Construction Materials Industry,

2) the office of the Minister of Administration and Land-Use Management,

3) the office of the Minister of Agriculture and Food Economy,

4) the office of the Minister of Forestry and Timber Industry,

5) the office of the Minister of Materials Management,

6) the Office of the Minister for Price Affairs.

2. The following are eliminated:

1) the Office of Environmental Protection and Water Management,

2) the Central Office of Geology,

3) the Main Committee for Physical Culture and Sports,

4) the Main Committee for Tourism.

3. The Price Administration and the District Price Administrations are eliminated. Tasks formerly under the jurisdiction of the District Price Administrations now pass to the jurisdiction of the treasury offices.

4. The central organ of state administration and the office of the Main Inspectorate of Energy Management are eliminated.

Article 10. 1. The Council of Ministers, by way of an ordinance, will define the detailed jurisdiction of the ministers referred to in Article 1-4, the Minister of Finances on price matters, and the Main Committee for Physical Culture and Tourism.

2. The organization of the executive apparatus of the organs mentioned in paragraphl, the organizational units subordinate to or supervised by these organs and the state enterprises for whom they perform the function of a parent body, are defined in a statute conferred by the Council of Ministers.

3. The Council of Ministers will determine the procedures and dates by which the newly appointed offices of ministers, Minister of Finances, and the Main Committee for Physical Culture and Tourism, will assume jurisdiction.

Article 11. 1. The Council of Ministers, in order to ensure uniform implementation of legitimately singled-out tasks of special social or economic importance, may establish a position of secretary of state in the office of the Planning Commission, ministry, or other office directed by a minister.

2. The Council of Ministers may also specify central organs of state administration whose directors are appointed in the rank of secretary of state.

3. The Chairman of the Council of Ministers appoints and dismisses secretaries of state.

Article 12. 1. The Council of Ministers may, in the structure of the office of chief organ of state administration, establish a government representative for tasks of special social or economic importance.

2. The Chairman of the Council of Ministers appoints and dismisses government representatives.

Article 13. In the law dated 31 July 1981 on salaries for persons occupying leadership state positions (DZIENNIK USTAW, No 20, item 101; 1982, No 31, item 214; and 1985, No 22, item 98) in Article 2 pt 3 the words "chief of the Office of the Council of Ministers" are deleted and the words "deputies to the Chairman of the Planning Commission in the Council of Ministers" are replaced by the words "first deputy to the Chairman of the Planning Commission in the Council of Ministers, deputy Chairman of the Planning Commission in the Council of Ministers, secretary of state, first vice president of the Polish National Bank.

Article 14. 1. Within the scope of the law, former provisions pertaining to the establishing of chief and central organs of state administration are no longer valid.

2. The Chairman of the Council of Ministers, by way of an ordinance issued by 31 December 1985, will define in detail the jurisdictions reserved in the provisions specific to the jurisdictions of the organs elinminated by this law, which are now assigned respectively to the jurisdictions of the organs established on the basis of the law, and the organs referred to in Article 5, 7 and 8.

3. Jurisdictions not covered by the ordinance referred to in paragraph 2 will expire on the date of its publication.

Article 15. The law goes into effect on the date of publication.

COURT RULES ON STATE FIRMS PAY LEVELS

Warsaw RZECZPOSPOLITA in Polish 20 Nov 85 p 4

[Report by (wl): "Social Arbitration Decisions Are Not Actionable"]

[Text] On 19 November the Supreme Court, by dismissing a special appeal, ended the well-known dispute (also described in RZECZPOSPOLITA on 12 November) about whether social arbitration can decide pay levels in a state enterprise.

In January of this year the Social Arbitration Council in the Labor and Social Security District Court in Opole ruled that the application of the trade union in the Opole Automobile Repair Factories for a wage increase was justified and awarded an increase of an average of 2,200 zlotys a month per employee. The decision was motivated mainly by the low level of pay in this enterprise, as compared with others, which was responsible for the fact that employees were constantly leaving. During 1982-1984, 220 employees left, and another 150 have left since 1 January 1985. The deteriorating cadre situation threatened to totally disorganize the work in the factories.

The Arbitration Council's decision also indicated ways to obtain funds for the increase: Fully mobilize the workforce, grant the enterprise the maximum correction index, and reach the point at which payments no longer have to be made to the PFAZ (State Vocational Activization Fund).

The Minister of Justice stated that the Council's decision conflicted with the law and with the interests of the Polish People's Republic. At a hearing before the Supreme Court, the prosecutor general supported the minister's position and stated that the Council's decision is really aimed at obtaining relief from payments to the PFAZ.

Representatives of the trade union and the factory management spoke in favor of dismissing the special appeal.

The trade union representative: Our demand was just. That fact that the Council in justifying its decision indicated that the management attempted to get relief in no way prejudges this case. This is only an unbinding opinion.

The legal adviser: The increase has mobilized the workforce to produce more. The results are already evident.

At the same time, both representatives questioned the procedure by which the decision of the Council, which is a social body and not a judicial body, was dismissed in court.

A procedure before a Social Arbitration Council, in the opinion of the Supreme Court, is one of the stages of mediation in factory disputes. Decisions of this body may be, but do not have to be, binding. Therefore, the Council's decision has no legal validity.

The Supreme Court, composed of three judges (W.Nyga, chairman of the adjudication team, M. Rafacz-Krzyzanowska, and S. Szymanska), thus rejected the special appeal, saying that it is not allowable from a decision of the Social Arbitration Council, which is not a judicial body. The fact that the president of the court is also a member of the Council does not mean that the Council acquires judicial standing.

SEJM COMMISSIONS MEETING SCHEDULE

Warsaw RZECZPOSPOLITA in Polish 29 Nov 85 p 5

[Text] (PAP) The Sejm commissions intend to complete all of their analytical work on plans for next year's state budget, other financial documents, and laws submitted to the Sejm on Wednesday, by 13 December.

This was decided at the joint meeting of the Commission for Economic Plan, Budget and Finances and the Commission for Legislative Work, with the participation of the chairmen of all of the parliamentary commissions. By that date too, the opinions and proposals arrived at by the particular commissions, will be summarized.

Roman Malinowski, marshal of the Sejm, who took part in the meeting, announced that during the first half of December the presidium of the Sejm would meet with the chairmen of the commissions and the chairmen of the provincial deputies groups, to discuss the plan for the Sejm's work next year and methods of cooperation.

*

The Sejm Commission for Internal Affairs and Administration of Justice met on the 28th of this month. Organizational matters relating to deputies' work on a draft of the budget law for 1986 and the commission's work during the current Sejm session were discussed.

FACTIONAL MANEUVERING IN ADVANCE OF PZPR 10TH CONGRESS

Frankfurt FRANKFURTER ALLGEMEINE in German 8 Feb 86 p 10

[Article by Joerg Bremer: "Jaruzelski Sends Greetings--Polish Communists Prepare for Their Party Congress"]

[Text] Warsaw, February--The discussion between the party leadership and the membership is beginning in Poland at this time. Although the 10th Congress of the Polish United Workers Party (PZPR) is not scheduled to take place until June, perhaps not until the end of June, it is necessary to overcome all disputes by that time, and the majority has to be such as to enable the state leadership under party chief Jaruzelski to conduct a harmonious party congress. The 23d Plenum of the Central Committee provided some indications about the time schedule, and the 24th Plenum clarified the main ideological points, to be followed immediately by the dispatch of a draft program to the party base. Between February and May each party cell must meet at least four times, consulting twice about the program and twice about the party theses. The regional organizations are to consult in the voivodships in May. In November the party had 2,112,000 members. Since the middle of last year the PZPR has again managed to register a greater number of accessions than withdrawals, with party candidates numbering 52,304 by November.

The 23d Plenum stated that there would be individual conversations between local and plant party secretaries and each member. The question here is not another verification, said Central Committee Secretary Mokrzysczak recently in an interview with the party organ TRYBUNA LUDU; the party has 5 years of purges behind it. Rather, the party leadership wants to hear the opinion of every member, he pointed out. This appears to be necessary, for the politics of the technocrats and generals are far ahead of the views of the base. Thus a Stalinist method is now being resorted to to make the economic reform palatable. It was introduced in 1982 without consulting the medium- or low-level cadres and is unpopular because people now have to run greater risks and must work harder. Apparently the reform is still so shaky as to have prompted the following recent statement by party chief Jaruzelski: "The reform has not yet won out, but it is defending itself. That is quite an optimistic observation."

The ninth party congress in mid-July 1981 had been marked by the idea of speedy change. The Solidarity union dominated the thinking and sentiments. The Communist Party made itself more or less accessible to democratic rules, and among the people who obtained posts were some who, though well known, lacked political solidity. Now that reform is taking its toll. By limiting the tenure of any party post to two periods of 5 years each, it was intended to reduce the accumulation of posts. Good people did not leave their professions only to have to start all over again after 10 years. And whoever got on the party horse at that time now will not let himself be unseated.

The preparations for the 10th party congress, however, are not only guided by the resolution of the 23d Plenum; in addition, it coincides in part with the Soviet party congress but for the major part takes place after the Moscow event. Probably the party leadership in Warsaw too wonders about the new course of Soviet General Secretary Gorbachev. But wherever it would like to prevail in certain questions about which Moscow may be holding different views, Jaruzelski might be interested in prevailing during the next few weeks. This may concern questions of personnel as well as the program. It is already becoming evident that the party leadership is courting critics on the so-called right wing, for instance by appealing to the national conscience. Just these days the first congress was held of the "Vistula-Odra Society" headed by the nonparty anti-German Deputy Meclewski, with the party chief sending cordial greetings. A "Grunwald Committee" has now emerged at the Patriotic Movement for National Renaissance (PRON). Here it is said to be primarily a question of collecting funds for a monument commemorating the victory of the Poles and Lithuanians against the Teutonic Knights near Tannenberg. But that is probably not the whole story. PRON--a creation of the government--needs an upswing. Like all united fronts before it, it is ossifying. This would mean the failure of an idea of Jaruzelski's, and the general is therefore particularly interested in what goes on at PRON. The impression prevails that the government and the party wing supporting it are not uncontested. The party is not only a government lobby but also an opposition. Apparently it is less a question of issues--for example, economic reform or Poland's disastrous ecology--than, above all, one of power. Within a period of 5 days the official news agency PAP announced the relief of five district party secretaries. Kociolek, former ambassador in Moscow, is said to be on "recuperation leave." Former Foreign Minister Olszowski is reported to be engaged in academic work.

Nothing has been heard for a long time of Grabski, former economic adviser in East Berlin. In late October 1982 he had composed an open letter of criticism. The fact that Grabski resorted to this unusual method, showed what straits the opposition within the party was in. In the meantime this has changed somewhat. There are now fewer big names of the "oppostion from the right," but there are many who have been deprived of power. These could ally themselves with those who have never been in power but now would like to advance to the decision-making level. Martial law put some generals into posts which really should be held by civilian party cadres. Jaruzelski must see to it that the small "opposition from the right" is not strengthened considerably by this bigger "opposition from ambition." And there is a third counterforce, which is perhaps the most dangerous one. Whoever is still one of the 2.1 million party members has bent himself into shape quite a bit. He participated in the uprising from below at the time of Solidarity and has survived the purges during martial law. He did not quit like so many who belonged to the moderate camp. What can have kept him in the party: his phlegma or his ideological orientation?

The plegmatic ones, Jaruzelski wants to arouse with the individual conversations that have been decided on. The ideologues, he has to convince, and there he will be in difficulty, because ideology has been in no greater demand among the pragmatists in the military than among the economic technocrats in the apparatus. The general's concentration on the party leadership since the change in government last fall shows that he realizes this shortcoming. The 24th Plenum is to occupy itself with ideology and education. A revival of orthodox demands is spreading in the press. There is again more talk about democratic centralism than was the case at the ninth party congress. The party leadership will try also to attack its opponents with ideological arguments. Ideology is always conservative, though. So the government will try to obliterate the contrast between a moderate course and hard-line ideology.

POLITICS POLAND

BRIEFS

VOIVOD COMMITTEE ECONOMIC TALKS--Wlodzimierz Mokrzyszczak, secretary of the Central Committee and deputy member of the Politburo, chaired a meeting at the Central Committee of the PZPR with the heads of the divisions of party economy within the voivod committees. The meeting was devoted to a discussion of finance and economy within the party in 1986 with particular attention to an improvement of economic management and increasing thriftiness in the current activities of party organizations. Kazimierz Morawski, head of the Central Review Commission of the PZPR, took part in the meeting. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Feb 86 p 2]

STRAINED RELATIONS WITH SWEDEN OVER BARESIC, OTHER CASES

Stockholm SVENSKA DAGBLADET in Swedish 3 Jan 86 p 13

[Article by Sune Olofson: "Dragicevic, Baresic Pawns in Foreign Ministries' Game"]

[Text] The Foreign Ministry now admits that relations with Yugoslavia are strained. Even though the cases of Ivan Dragicevic and Georg Komaromi have not been settled, the Swedish embassy in Belgrade proposes that Sweden should officially invite Yugoslav Prime Minister Milka Planinc or Foreign Minister Raif Dizdarevic.

The Foreign Ministry had hoped that Ivan Dragicevic could be reunited with his family in Olofstrom before New Year's. That did not happen, however. Yugoslavia is still refusing to release Swedish citizen Dragicevic, even though a court in Sarajevo decided that his passport should be returned.

"Inflamed Atmosphere"

It is also evident now that there is a link between the cases of Ivan Dragicevic and Miro Baresic. In a report to the Foreign Ministry on the paroling of Baresic, Swedish Ambassador Lennart Myrsten writes the following:

"The Baresic decision has naturally complicated the matter of Dragicevic's leaving. It seems to me to be extremely difficult to push Dragicevic's case. Dragicevic, as you know, is now suspected of running errands for the Croatian separatists... Our gunpowder is wet here for the time being."

Everyone who knows Ivan Dragicevic assures us that he has been completely apolitical during his 20 years in Sweden. He only belongs to a Croatian Catholic religious association.

A Matter for Negotiation?

The question now is whether metallurgical worker Ivan Dragicevic of Olofstrom has become a matter for negotiation. Yugoslavia has expectations of more severe steps against Miro Baresic, the murderer of an ambassador.

The Foreign Ministry will not officially make that connection.

"It is probable that Dragicevic will be able to return to his family in Sweden," says Bertil Jobeus of the Foreign Ministry's press office. "We cannot understand why he has been kept so long, more than a year now.

"We have borne in mind certain reports that this issue can be settled, regardless of the friction between the two countries. The Baresic and Dragicevic cases have complicated our relations."

Yugoslavia has not specified the charges against Ivan Dragicevic. No trial has been held. Dragicevic's passport was taken away during a vacation trip in the summer of 1982. In Sweden, Miro Baresic had filed his third application for a parole, which was afterwards turned down. The publicity surrounding Baresic's fourth application for a parole, which was granted, was considerable. Lennart Myrsten writes:

"What offends the Yugoslavs most of all is that the government decided to commute the sentence in spite of the fact that Baresic never showed any real remorse in his repeated statements, either before or after the decision on the parole. On the contrary, he has even declared that he is going to fight for Croatian separatism, to all appearances by violent means, at least outside Sweden's borders. If a criminal like that is paroled, the Yugoslavs will interpret the decision as a tacit acceptance of terrorism."

Former Minister of Justice Lennart Geijer and former conservative leader Jarl Hjalmarsson were the ones who endorsed Baresic's application for a parole. Here is how Lennart Myrsten describes the Yugoslavs' reaction:

"The Geijer-Hjalmarsson pair's maudlin statement demonstrates what to the Yugoslavs is an incomprehensibly naive alienation from reality, in view of his long political past. It seems to me, however, that psychiatrist Goran Sedvalsson, who quite frankly declares it to be out of the question for Baresic to go back to violent crime, takes the prize."

In a year, the prison commission will decide whether Baresic is suitable for half-time release or not. If he is suitable, he will be free in the fall of 1987. From the Yugoslav point of view, the Swedish authorities still have a possibility of acting against Baresic.

A TV program produced by Yugoslavia's state-run television demands that Sweden ban anti-Yugoslav activity and "repair the damage" done to relations by the paroling of Baresic.

Bertil Jobeus says, "The Swedish government has no sympathy for anyone who wants to use violence or threats to undermine Yugoslavia's integrity. Sweden will not assist in breaking up Yugoslavia. We have recognized Yugoslavia, and we desire good and stable cooperation. Yugoslavia is a stabilizing factor in the Balkan region and in Europe."

Lennart Myrsten writes, "In the situation in which we now find ourselves, I wonder whether it would not further our desire to continue good relations with Yugoslavia if Prime Minister Planinc or Foreign Minister Dizdarevic were to be invited to pay an official return visit."

Family Held Hostage

Georg Komaromi has waited in Norrkoping for three years for his wife and two children. They are being held as hostages in Yugoslavia. Komaromi, as the chairman in a workers' court, refused to acquit three high party officials who were suspected of bookkeeping crimes. He fled to Sweden.

DRAGICEVIC PERMITTED TO LEAVE YUGOSLAVIA

Stockholm SVENSKA DAGBLADET in Swedish 12 Jan 86 p 7

[Unsigned article: "Dragicevic Home Again"]

[Text] Malmo (TT). "I could never have imagined that it would take so long. When they took away my passport, I thought it would take a couple of days."

Ivan Dragicevic was kept in Yugoslavia by the authorities for 18 months. He has now been reunited at last with his family in Malmo.

"It has been a long wait. I never got to know the real answer to the question of why I was being held, either," he told TT.

There was a celebration at Ivan Dragicevic's home in Malmo on Thursday. His friends came to congratulate him. Several of them had traveled down from Olofstrom, where Dragicevic and his family had lived previously. Flowers from his employer there stood on the table.

"The feelings that my family and I felt when they opened the door to the apartment and I stood outside cannot be described. It was incredibly wonderful to come home," he said.

It all began the week before midsummer in 1984, when the family was to travel for a vacation to Ivan's home town in Yugoslavia. They had lived in Sweden since 1968, but Ivan was still not a Swedish citizen.

The Police Took the Passport

After several days, the police came to the town and took his passport away from him. He was forced to remain in Yugoslavia. His wife and children had to return to Sweden alone.

"It was not a particularly wonderful feeling," he said. "But I believed that it would be settled, since I had not committed any crime. I was accused of being involved in anti-Yugoslav movements that I had never heard of. I have never been politically active."

For a while, he lived at the Swedish embassy in Belgrade. The foreign minister at that time, Lennart Bodstrom, also brought up his case during a visit to Belgrade. During his stay at the embassy, he also received Swedish citizenship. That did not help, either.

"I was very happy about the citizenship, and I believed that it would be straightened out then. It did not go exactly as I imagined."

In the middle of November 1985, he left the Swedish embassy and traveled home to his parents to help them with the farm. Several days ago he received his Yugoslav passport back from the authorities, quite unexpectedly.

"I did not get any particular information about why I was getting it back. I didn't ask, either, I just left."

"Not Bitter"

During the 18 months of his long wait, he was free the whole time, but he had to undergo interrogations.

"I was never afraid for myself, but I was very worried about my family at home in Sweden. I am not bitter any more," he said. "Right now it's just wonderful."

What will happen now is a little uncertain. During the time that he was held in Yugoslavia, his family moved from Olofstrom to Malmo.

"Now I am going to have a really good rest, and think the problem over," he says. "I have to talk everything over thoroughly with my family."

In spite of everything that he was forced to undergo, he can still imagine himself going back to Yugoslavia.

"I still have my old parents there. As long as they are alive, I will visit them. I am not afraid, I have not done anything, and I therefore know that I am not guilty."

COMMENTATOR VIEWS SOVIET ARTICLES ON SELF-MANAGEMENT

AU261953 Belgrade Domestic Service in Serbo-Croatian 0900 GMT 26 Jan 86

[Branislav Canak commentary in the "Sunday at 10" program]

[Text] An article carried in the latest issue of the journal VOPROSY EKONOMIKI published by the Economic Institute of the USSR Academy of Sciences, stresses that socialist self-management can be realized exclusively within the framework of real socialism. Branislav Canak has made a commentary on that occasion:

Self-management has been more and more frequently mentioned in the Soviet Union, within the ideological discussions on the development of socialism. Views differ, ranging from the one that the organization of a socialist society has to lead to self-management in its final outcoming to its negation, and negation with such language that one usually uses when speaking about profound ideological deviations.

The discussions on the trends of the building of socialism in Soviet society are lately put into the context of new historical conditions--as has been frequently emphasized also from the political top. One speaks about the tasks of the new historical stage, something which implies new political and ideological answers, of course, and a different economic policy from the one from the past stages. The self-management of the people as the main landmark of future development of the political system of the Soviet Union, was mentioned by Andropov and Chernenko. The new edition of the CPSU program points out that the strategic line of the development of society consists of improving Soviet democracy and in an over fuller implementation of the socialist self-management of the people. However, articles that look as if they come from 1961, the time when the present program was adopted, sometimes appear, particularly in professional periodicals. Thus, an article entitled "Socialist, Self-management in Bourgeois and Revisionist Interpretation," written by (V. Caga) appeared in the January issue of the journal VOPROSY EKONOMIKI. Self-management is possible only in a system of real socialism, all the rest is a part of the arsenal of international counterrevolution, (Caga) says among other things. The author does not locate the nests of counterrevolution, believing, probably, that it is generally known where in the world self-management has been developing without prescriptions and socialist catechism.

The text in the VOPROSY EKONOMIKI is not the only one. Some other theoreticians and scientific workers have made themselves heard during the preparations for the forthcoming CPSU Congress and debates on various spheres of the Soviet ideological, political, and social development. Thus, an article in the journal SOVETSKAYA ROSSIYA last year explains self-management to the readers as giving new form to old reformist ideas and as an attempt to organize society upon anarcho-syndicalist principles. The author even adds that from the standpoint of Marxist-Leninist theory that concept is both utopian and reactionary.

Where does all that gall come from and what for? Who is it that should be dissuaded, and persuaded that self-management has several faces but that only one is the right one? It is possible that what suits Soviet society best in this stage of development is realization of self-management of the people through the state and, above all, through the Soviets of people's deputies. An important role was given to enterprises where, through the law on working collectives, employees get certain opportunities to participate in solving everyday questions. The modernized program that is going to come before the delegates to the 27th CPSU Congress is trying to get rid of some dated views and stereotypes contained in the present version. According to that version, for instance, the CPSU is building Communism within the world socialist system, and, according to the new edition, it is doing so within the borders of its country. This probably applies to self-management, too.

KOSOVO TO IMPROVE RADIO NEAR ALBANIAN BORDER

Kosovo SAWP Presidium Meeting

AU051810 Pristina RILINDJA in Albanian 30 Jan 86 pp 1-2

[Report by C. Aliu]

[Excerpts] The Presidium of the provincial conference of the Kosovo SAWP at yesterday's meeting led by its chairman, Hysen Prekazi, and where among others present were Azem Azemi, member of the Presidium of the Socialist Autonomous Province of Kosovo, and Kocusha Jashari, chairman of the Provincial Council of the Kosovo Trade Union Federation, discussed various topical problems of local radio stations, and defined various concrete duties for their improvement.

In spite of results achieved, and continual progress, said Jorgovanka Milojevic in the opening speech and in discussion, there are weaknesses in our network of local radio stations, especially with regard to programming and technical arrangements, since broadcasting in the Socialist Autonomous Province of Kosovo does not operate as a unified network, which hampers the successful realization of present duties, and fails to meet the need for prompt additional general news in all districts. This becomes particularly important, considering the fact that some of these local radio stations are in border areas, where public opinion is subjected to the continual pressure of propaganda from the People's Socialist Republic of Albania. Therefore, our propaganda presentations on local radio must achieve the desired effect with the best possible organization.

Hence, it is important that our program planning in local radio stations in general, and especially in areas bordering on the People's Socialist Republic of Albania, should have analytic features, and well thought-out commentaries on the activities of organized socialist forces, and on the achievements that have been reached in Kosovo. There should be more encouragement than before for the kinds of journalistic approach that contribute to truly human relations between people, and the greatest possible mutual acceptance and understanding between our peoples and nationalities, and the creation of a democratic, self-managing, and socialist consciousness. A weakness of these information media, the meeting observed, is that their programming policy and content do not express properly the interests of the working class and working people in our self-managing society, and that their use of recorded reports weakens their authority and influence, and so forth.

There are various reasons for this situation, but the primary causes are the lack of trained staff and journalists, the lack of material resources, accommodations, etc. Able and trained staff do not stay long in these radio stations, because they do not have good material conditions, and one worry is the fact that various people in responsible positions despise these journalists, which closes off the sources of information. On the other hand, because of the lack of material resources, many radio stations, faced with financial problems, resort increasingly to economic propaganda broadcasts, music, and listeners' requests. This presents a permanent danger of intellectual and aesthetic distortion, leading to a decline of taste, and in recent instances damage to the authority of these radio stations.

To confront all these things, the SAWP must make decisive efforts for the socialization of these information media, preventing monopolistic tendencies in communication, and through its delegates and delegations, influencing programming policy, and editorial and staffing policy, in all the public information media--and also in local radio stations, which form an integral part of this network.

Measures To Prevent Albanian Jamming

AU101726 Belgrade Domestic Service in Serbo-Croatian 1400 GMT 10 Feb 86

[Text] The Belgrade Radio Program Council has endorsed the report on the program of activity of Belgrade radio during the past year. Members of the council have positively assessed both the orientation and quality of the program. Representatives of Belgrade radio informed members of the council about warnings from many listeners that the audibility of Belgrade radio's first program was being interferred with by jamming in the areas of Kosovo and a part of Montenegro and that this was being done exactly during informative programs. Tests carried out have shown these warnings to have been correct. The source of the jamming is in Albania. Belgrade radio has undertaken all measures with our state organs with a view to having this unlawful interference of national and interstate activity prevented.

POLITIKA REPORTS ON SATELLITE DISH ANTENNAS

AU111034

[Editorial Report] Belgrade POLITIKA in Serbo-Croatian on 1 February on page 8 and on 3 February on page 6 carries a number of reports, ranging in length from 500 to 1,200 words, on the production, installation, and the legality of satellite dish antennas in Yugoslavia.

The first of the two reports carried in POLITIKA on 1 February, a 1,200-word report by Milisav Krstic, provides details regarding the production and installation of antennas. According to it, Ohrid will soon install a dish antenna of unspecified size "which will enable its citizens to receive almost all the world's radio and television programs which are broadcast via satellite. The engineers from Ohrid's Video-Engineering Work Organization have already completed the project which will be finalized by the installation of a dish antenna produced by the Tito metallurgical plant of Skopje." According to the report "this producer's satellite antennas for the cable television system have already been installed in Split, Sarejevo, Belgrade (Sava Center), Skopje, and Zagreb. As is expected, the satellite antennas will soon be available to the European market. These antennas will be slightly smaller in diameter, 2.4, 1.8, and 1.2 meters."

A boxed report by V.R. within Krstic's report refers to the legal aspects of receiving foreign television programs and cites Zoran Josipovic, assistant secretary to the president of Serbia's Committee for Information, saying:

"Owning an antenna for receiving foreign satellite programs in Serbia is not and cannot be prohibited. The question of receiving satellite programs has not been dealt with in the Law of Public Information because--and the reason is clear--these programs are not broadcast by our domestic television." Josipovic then went on to say that the law on this matter will become more precise in the next few years because all radio and television organizations have the introduction of satellite programs by 1990 in their plans. Meanwhile, "satellite programs are allowed to be received by all those who have an antenna."

The other report carried on 1 February a 500-word report by R. Kovacevic, refers to the installation of a dish antenna in Split. Following the objection raised by the Zagreb Television, an inspector from the Republic's Committee for Traffic and Communications declared the installation illegal by quoting an article from the Republic Law on Public Information according to which "the installation of radio-broadcasting objects for receiving foreign programs outside the Radio Television Zagreb system is prohibited." Apart from the installation of the antenna, according to the inspector, they also broke two federal laws which were not specified in the report, and the international copyright law which our country respects.

A 500-word TANJUG report in POLITIKA of 3 February on page 6 refers to efforts being made in drafting new legislation regarding satellite television. According to the new legislation, receiving cable television programs will require licenses for which only organizations and not individuals will be eligible. The Federal Office for Radio Communications has granted few such licenses. Among the recipients of the license which is valid for only 1 month was the Tito plant of Skopje. The license was granted for the purpose of testing the new antennas only which makes the sale of the antenna to the Split Video Club "unauthorized." According to the TANJUG report "the license for receiving programs via satellites which are primarily meant for cable television require an agreement with the owners of the satellites and with the producers of the satellite programs. An agreement signed with the owners is valid for all receivers in the country. Agreements with program producers is signed either directly by the users themselves or through authorized organizations for the protection of copyright.

"In contrast to these satellites which are used for the distribution of commercial television programs, in the future we shall have radio-diffusion satellites which will broadcast programs for the general public. These are the programs we are currently receiving via ground transmitters. For receiving these programs one will not need a license."

KOSOVO LC DISCUSSES VETERANS ALLEGATIONS

AU121727 Belgrade BORBA in Serbo-Croatian 3 Feb 86 p 3

[Article by M.A.]

[Excerpts] Pristina, 2 Feb--On 1 February the Provincial Committee of the LC of Kosovo adopted the draft report on the committee's work between the two conferences, the draft resolution for the 14th Conference of the LC of Kosovo, and the preliminary draft of the amendments to the Statute of the LC of Kosovo. All these documents have been submitted to a public discussion which will last 2 months.

The Provincial Committee of the LC of Kosovo fixed the 14th Conference of the LC of Kosovo for 28 and 29 April 1986. It will be held in Pristina.

What the Veterans Said

At the beginning of the session, Veli Deva requested that the Provincial Committee of the LC of Kosovo be informed about the meeting of the section of veterans from Kosovo who live in Belgrade which was held on 12 December in Belgrade and which was attended by Kolj Siroka. Deva said that he learned in KNJIZEVNE NOVINE that "the conclusions adopted with acclamation and applause" attacked not only some prominent revolutionaries but also the 40-year policy and struggle conducted by the LC of Kosovo in all front. He said that the Provincial Committee must declare itself about such accusations, because silence brings disorientation among LC members.

At the conclusion of the session, Kolj Siroka informed the members of the LC Provincial Committee rather extensively about this meeting, after which an extremely lively and polemical discussion followed in which several members of the Provincial Committee took part. Afterward it was agreed that the Presidium should prepare a special report and that one of the coming sessions should discuss it and adopt appropriate stands.

POLITICS YUGOSLAVIA

WESTERN COMMENT ON MIKULIC NOMINATION

Frankfurt/Main FRANKFURTER ALLGEMEINE in German 4 Feb 86 p 6

[Article by Viktor Meier]

[Excerpt] Mikulic said... in a kind of "program-presentation speech before the Socialist Alliance... that he wanted only people in his government who are Yugoslav-oriented and have the necessary professional and "political-moral" qualifications. And if this goal should not be realized, he could consider relinquishing his post [he said].

The formulation "Yugoslav-oriented" has aroused attention in Belgrade because it expresses also unitarist and centralist opinions, even if Mikulic spoke of a "balance" between the interests of the republics and the federal interest. In any case Mikulic appears to see the strong power apparatus of the republics as the opponent; this will result in conflicts. A certain skepticism prevails in Belgrade as to whether Mikulic, a Bosnian, can restore the authority of the federal government as he seems to think he can.

The initiative which led to Mikulic's nomination began last November in the State Presidency and was linked to criticism of Milka Planinc. The initiative was made above all by three Presidency members, Vrhovec (Coratia), Dolanc (Slovenia), and Mikulic. It appear that former general and defense minister Ljubicic, the Serbian representative, who is feuding with the present party leadership, associated himself with them. Whether part of the army leadership also supported the initiative is not known; the army has several times recently supported a strengthening of federal power.

The members of this apparent "alliance" also have differences among themselves. The initiative may have resulted, rather, from an accidential cooperation among the most active elements in the state leadership. All those involved were persons who are having difficulties in their own republics. Mikulic took the chance of stepping down one level in the hierarchy. To be sure, the essential decisions today are made, above all in the federal government [Federal Executive Council]. The "guidance" role of the State Presidency has so far been found not to be effective. The authority of the Party has been in question for a long time. The form of the initiative is tied to the results of the "Critical Analysis" of the functioning of the political system which was undertaken by a commission led by Presidium member Vrhovec. The attempt is being presently made to bring the results of this Analysis into the platform for the up-coming Party Congress in June.

The cautious assessment of this attempt to bring about a "centralist renaissance" is based not only on the anticipated conflicts with the strong republic leaderships but on the inefficiency of the federal bureaucracy to which many speakers from the republics have referred. The initiative is very pointedly against Serbia..., whose party leader, Stambolic, was demonstratively rejected from the beginning as a candidate for the post. Slovenia also has little liking for Mikulic. In Croatia a rather federative spirit has also prevailed, at least in the economic-political field. Intellectuals from all republics fear the "Bosnian conditions"--a reference to the clear disrespect for human rights and freedoms in Bosnia-Hercegovina.

BRIEFS

SVETISLAV POPOVIC VISITS KOSOVO--Pristina 13 Feb (TANJUG)--Lieutenant Colonel General Dr Svetislav Popovic, assistant Federal secretary for national defense, who is paying a 2-day visit to the Autonomous Province of Kosovo with his aides, today had talks with Nedjo Borkovic, president of the provincial Executive Council. It was reported that the level of cooperation achieved so far between the Yugoslav People's Army and the Kosovo economy had been successful, and that possibilities exist for further expansion and progress. The representatives of the Federal Secretariat for National Defense will also visit a number of organizations of associated labor in the province. ETHNIC ZONING NOTICED--A session of the Committee for Relations Among Nationalities of the Republic Conference of the SWP of Macedonia discussed the activities of the SAWP of Macedonia in the development of brotherhood, unity, togetherness, and equality in the republic. It was pointed out that the sociopolitical activities and the measures taken in the past period have given quite good results in preventing public organized actions by Albanian nationalists and irredentists. In some communes in which sociopolitical activities have been well-organized and constant, visible successes have been noted. People of Albanian nationality are joining more in actions against the hostile activities of Albanian nationalists and irredentists. It was pointed out in the discussion, however, that even in the capital, Skopje, the phenomenon of creating pure ethnic communities or rather zones is present. In nationally mixed parts of the city, some people sell their apartments and move to those parts where their co-nationals are more numerous. The request was voiced in the discussion that a more serious approach be made to this question and that measures should be taken against this phenomenon. INTERNATIONAL COOPERATION IN NUCLEAR RESEARCH URGED

Prague RUDE PRAVO in Czech 4 Dec 85 p 4

[Article by Zdenek Tluchor, candidate of sciences, director of the Institute of Plasma Physics, Czechoslovak Academy of Sciences: "A Hope Named TOKAMAK"]

[Text] We know that both sides at the Geneva meeting between Comrade Mikhail Gorbachev and President Ronald Reagan decided that they will contribute through joint research and practical steps toward fulfilling, among other tasks, the global task of protecting the environment. They consider the broadening of exchanges and contacts in the fields of education, culture and many areas of science, such as the fight against malignant illnesses, to be a worthwhile goal.

Both leading representatives emphasized the potential significance of research focused on the peaceful use of controlled thermonuclear fusion, in which connection they agreed that there should be multinational practical development of international cooperation in the effort to put this basically inexhaustible source of energy to use for the good of the entire human race.

Let us take a close look at the substance beneath the words of the final paragraph of the joint communique. We know from the discussions and publications of recent years that the human race has already exhausted a significant proportion of the resources of fossil fuels (coal, petroleum, gas) which have accumulated on earth over millions of years. Because the supplies of these fuels, which are distributed extremely unevenly among the individual countries of the world, will last but several decades or centuries, the human race is faced with the necessity to learn how to effectively utilize the energy freed from atomic nucleii, i.e., atomic or nuclear energy. One of the ways of freeing this energy is to split the atoms of heavy elements, for example uranium. Since the first Soviet nuclear power plant in Obninsk, built in 1955, the world has been building power plants using the splitting of uranium. But even the supplies of Uranium-235 isotopes, from which energy is obtained in particular with the current generation of nuclear power plants, will last only several decades. In the future, Uranium-238 will be used, and will be converted to fissionable plutonium in so-called fast reactors, with the result that it will be possible to increase the capacity to use fission reactors to meet the fuel energy balance by a factor of at least 20.

However, it is assumed that the main source of atomic energy will later be controlled thermonuclear chain reactions of light elements, for example the isotopes of hydrogen. Both during the fission of the nucleii of heavy elements and during the fusion of the nucleii of light elements, neutrons and other particles are freed whose kinetic energy represents atomic energy. This process was verified as early as during the testing of thermonuclear explosions which took place in the early 1950s. Since that time, the laboratories of the majority of the industrial countries of the world have been trying to develop equipment for the utilization of controlled thermonuclear reactions for the production of energy. On the other hand, thermonuclear fusion has been used for the manufacture of weapons of mass destruction, whether in the form of hydrogen bombs, neutron bombs or other bombs. Supplies of these weapons continue to grow. By limiting armaments or through nuclear disarmament, the human race would not only be able to meet financial needs, but would obtain the materials needed to accelerate research on thermonuclear fusion in thermonuclear power plants.

At present, the instrument designed in the early 1950s at the I.V. Kurchatov Institute for Atomic Energy in Moscow and known as TOKAMAK (after the initial letters of four Russian words which translate to mean "toroidal," i.e., annular chamber with magnetizing coils--ed.) is among the most developed and successful thermonuclear equipment. In the TOKAMAK, ionized gas (plasma) is formed in the annular (toroidal) chamber through which electric current flows to form a strong magnetic field. In order to reach the extremely high temperature needed for a thermonuclear reaction in the plasma, additional heating of it is necessary. One way to do this is to absorb the large high frequency output in the plasma. One of the most effective ways to do this is to use the output of a millimetric wave generator, the gyrotron, which heats up the electrons in the plasma. The USSR is significantly ahead of the rest of the world as regards research on and the manufacture of such generators. This has created an opportunity for Czechoslovak science and industry, within the framework of the joint research project of the Council for Mutual Economic Assistance, among other research projects, to take part in designing and supplying a significant part of this high frequency heating complex for the newly built large superconductive T-50 TOKAMAK at the I.V. Kurcatov Institute in Moscow.

Laboratory centers using this TOKAMAK equipment have been built in the USSR, the USA, Japan, and Great Britain, representing the members of Euratom. But there is still a long way to go to have a demonstrator thermonuclear power plant. For many years the USSR and the USA have had a joint committee for the exchange of experiences and specialized scientists in this field. During its meetings (alternately held in the USSR and the USA), it evaluates the results obtained and the prospects for thermonuclear research in those countries. In recent years, however, its work has been hampered by the American side. One of the key areas of Soviet and American research is specifically the results of heating the plasma using 24 gyrotron generators, which have aroused great interest in laboratories throughout the world.

The last few years have shown that, for functional reasons, thermonuclear reactors must be relatively large and use expensive equipment. Future generations of thermonuclear reactors, like future power reactors, are supposed to cost somewhat less than current 1,000 MW nuclear power plants (with fast reactors). The huge costs exceed the present annual budgets for research in this field, even in the largest countries, indicating that there should be a joint effort on the part of many countries. That is why, as early as 1979 as the result of a Soviet initiative, a research group was established at the International Atomic Energy Agency in Vienna consisting of representatives of Eurotom, Japan, the USSR and the USA, with a view to carrying out a joint project on the TOKAMAK reactor. The international team of scientists and technologists gradually drew up a detailed project for the large TOKAMAK called INTOR, which when approved would be placed into operation in 1993.

There is no disputing the usefulness of such international cooperation in the case of this equipment. While the USSR has been suggesting a joint effort on this project from the very outset, in recent years it has been hampered by the negative position of the Western countries. The efforts of these countries went into individually and independently manufacturing a number of different small thermonuclear facilities similar to the INTOR, but with significantly smaller possibilities. That is why M. Gorbachev suggested first to the French president, and later at the Geneva Summit with President Reagan, the joint realization of the thermonuclear project on the basis of the TOKAMAK equipment. By limiting armaments, further resources have been obtained for the acceleration of this project. I reiterate that thermonuclear power plants will provide a lasting solution to the problem of providing a sufficient amount of energy for the people on earth for millions of years, not to mention their impact on the living environment, where turning to thermonuclear power plants would make a positive contribution to solving environmental problems.

The last paragraph of the joint communique of the leading representatives of the USSR and the USA in Geneva indicates that there is hope for positive steps in this area.

EUROPEAN CULTURAL FORUM APPRAISED

Bratislava PRAVDA in Slovak 16 Nov 85 p 5

[Article by Gejza Vilcek: "To Proclaim Promulgating Hate as Illegal"]

[Text] Budapest (From our permanent correspondent)--On Friday the Cultural Forum in Budapest terminated the phase of discussions in work groups, and the final week of plenary sessions is coming. On this occasion Miroslav Kaizr, press representative of the Czechoslovak delegation, stated, among other things, the following:

The past 5 weeks of Cultural Forum discussions and 4 weeks of exacting, though qualified and honest work in advisory committees should lead to a conclusive document. At present it cannot be said with certainty yet whether this document is going to be approved, and if so, in what form, scope and level. There are still many open questions and differing opinions regarding the very substance and sense of these discussions, as one could gather from the last presentations of some western countries' delegates. However, as early as today we can state with full responsibility that a significant representation of European culture has met here in Budapest, even when some western countries' delegates have not contributed much to an understanding with their presentations. Most of the gathered people are those, however, who have something to say to one another, who sincerely care about the questions as to what kind of cultural development is to occur in the future and what is the basic condition of this development.

Many delegates have discussed very positively some questions which concern us as well, and which have to be agreed upon. These are the questions of favorable development of juvenile literature and of a broader writers' exchange. Further topics of discussion included the ways of mutual acquaintance, the creation of conditions for the development of literature in lesser known languages and the consequent concern about the quality of artistic translation. Of great importance here is the cooperation of publishing houses, and dealing with many problems connected with the protection of authors against copyright piracy, which occurs particularly in some western countries.

An agreement has been reached regarding the proposal presented by the Czechoslovak delegation to set up a research task "Culture and Humankind on the Threshold of Millennium" which would cover questions of narrower cooperation in the education of young artists' generation, of collaboration among libraries and museums, and those of preserving the cultural values of the past.

The Czechoslovak delegation has very actively contributed to a positive resolving of some problems. During the 2 weeks of the Forum 25 prominent Czech and Slovak writers and experts contributed to discussions, many of them several times. Their presentations were accepted and evaluated as highly qualified and competent. All socialist countries' delegations thoroughly and patiently expounded the ways in which our culture flourishes, and in what ways we contribute to the development of cultural exchange and cooperation. Also, our delegation presented a series of proposals as to which problems should be dealt with in cooperation. However, they were not always met with understanding and agreement.

Prompted by the efforts of some delegations, the Czechoslovak delegation has proposed, issuing from the fact that one of the main obstacles on the road to broaden and improve cooperation is bias, mistrust and disinformation, to condemn psychological war as incompatible with the traditions and purposes of European culture. The governments of participating countries were recommended to take measures which would prosecute the spreading of lies about, and hate toward, other countries, as illegal. This proposal of our delegation has gained support of several other delegations.

To conclude, Miroslav Kaizr has proclaimed that even at present it is possible to state that a magnificent and unique encounter of the representatives of European countries is at stake here. This meeting has contributed to an open dialogue about all significant questions concerning present culture. One should believe that all delegations will draw their own conclusions, which by itself might be fruitful in the future.

SOCIOLOGY CZECHOSLOVAKIA

FATHER MALY ON HUMAN RIGHTS, POLICE HARASSMENT

Helsinki HUFVUDSTADSBLADET in Swedish 11 Jan 86 p 12

[Interview with Father Vaclav Maly by correspondent Frank Johansson: "A Dissident Speaks Out"; first paragraph is HUFVUDSTADSBLADET introduction]

[Text] Father Vaclav Maly is 35 years old. He is a Catholic priest and lives in Prague. Maly is one of about 1,300 Czechoslovaks who signed Charta 77. He has even been the spokesman for the civil rights manifesto. Vaclav Maly is officially an enemy of the Czechoslovak republic. He is a dissident.

"Hello there, and good luck," he said. "Be careful." When we shook hands he looked me straight in the eye. His eyes flashed and then he looked away again. He does that often. Perhaps because his eyes have a barely perceptible slant.

The pedestrian light changed to green and the little outspoken Catholic priest with the rumpled hair joined the throng. With rapid strides he went past the Hotel Intercontinental. He walked fast. He must get to a much smaller hotel in Prague's old town. In order to check the heating systems and stoke the furnaces. He works as a furnaceman.

"Be careful."

The last words that Vaclav Maly said sank slowly into my consciousness. I tried once more to see him, but the checkered flannel shirt and the dark hair had managed to disappear.

Of course it was not I who should be careful, but he.

-0-

One month later I was sitting at home reading what Amnesty International had written about Czechoslovakia. This was from the 1983 annual report:

"According to Amnesty's information former prisoners of conscience who continue their activies, and their families, are exposed to psychological pressure. Vaclav Maly and Ladislav Lis, who were released from prison in December 1979 are reported thereafter as having been repeatedly interrogated and watched by the police. According to reports Vaclav Maly was threatened with death by the police on 7 January 1982. Since then he has been under increasing pressure from the police to emigrate."

During interrogation on 7 January 1982 the police threatened to kill him in a "fixed" automobile accident or to throw him into the Moldau River from one of Prague's many bridges.

The same thing was repeated on 4 February 1982. The interrogators scoffed at his christian belief, threatened to make him a cripple and he was told not to meet other Charta 77 activists.

Also in Amnesty International's annual report for 1981 Vaclav Maly had the "honor" of being mentioned by name. Then it was a case of extreme mistreatment during a police interrogation.

-0-

"Three or four years ago I was interrogated regularly by the police, at least once a week," said Maly, at home in his apartment in Prague.

"Sometimes the interrogation lasted two hours, sometimes four. Occasionally I sat in prison for two days.

"Now I am called in for interrogation only four or five times a year. The last time that happened was just a week go."

On 19 September 1985 he visited his good friend, civil rights activist Ladislav Lis, in northern Bohemia. Late in the evening the police rushed into the house, searched it thoroughly and took Vaclav Maly away.

"First they took my clothes off down to my drawers, and then they interrogated me about a pistol which I really knew nothing about. The police knew it too. It was just a pretext for disturbing us.

"After the interrogation I was taken--still without clothes--out into a forest. I did not know the area, and I stumbled and fell over tree roots."

Maly still has abrasions on his arms and legs from the episode. He says that the entire time he was in the forest he could hear footsteps and heavy breathing nearby.

"They were trying to frighten me, and they succeeded." Finally he found his way out of the forest and back to the home of his friend.

-0-

Nine years ago, on New Years Day 1977, the civil rights manifesto Charta 77 was published in Czechoslovakia.

The manifesto came from the International Convention on Economic, Social and Cultural Rights and the final KSSE document at Helsinki.

The manifesto states:

"The human freedoms and rights which are outlined in these conventions are features of civilized life which many progressive movements have fought for throughout history, the codification of which can greatly help human development in our society.

"Accordingly we welcome Czechoslovakia's support for these agreements.

"That they are now being published as a code of statutes, however, is a powerful reminder of the extent of basic human rights in our country. Unfortunately they exist only on paper."

Thereafter Charta 77 criticizes Czechoslovak reality in detail, and in the end looks forward:

"Charta 77 is no organization, it has no charter, no journal and no established membership. Every person who agrees with its ideas, participates in its work and supports it can belong.

"Charta 77 is not a basis for political opposition. The group will serve the common interest in the same way as similar action groups in other countries in the East and the West.

"It will therefore not propose its own programs for political or social reforms or changes but will carry on a constructive dialogue with the political and national authorities. This will be especially to prove various specific cases of violations of human freedoms and rights, to prepare documentation thereof, to recommend solutions and suggestions with an aim to reinforcing and guaranteeing these rights, and finally to act as mediator in conflict situations which could lead to violations of these rights.

"By its symbolic name Charta 77 says that it has arrived at the threshold of a year which is declared the year of the political prisoner, and a year when the follow-up conference in Belgrade will test how well the obligations of Helsinki have been fulfilled.

"We believe that Charta 77 can help all Czechoslovak citizens to work and live as free people."

Charta 77 was signed by 257 Czechoslovak citizens. At the same time they chose philosopher Jan Patocka, writer Vaclav Havel, and former Foreign Minister Jiri Hajek from the 1968 "Springtime in Prague" government of Alexander Dubcek as the spokesmen for Charta 77.

Official Czechoslovakia immediately reacted violently to the Charta. Despite Jan Patocka's being very ill he was persecuted until the end by the security police.

Patocka died on 13 March 1977--Charta 77 had its first martyr.

Other leading signatories of the Charta--including Vaclav Havel--were arrested and imprisoned by the regime.

-0-

Even though Charta 77 is seldom seen in the news today, it is working silently the entire time. Every year about 30 reports and documents are published, mostly critical writings aimed at a public authority.

These writings are published in the names of the three spokesmen, who can be and have been women. The spokesmen are changed every year.

Since the start of 1977 the working area of the manifesto has expanded. Charta 77 now also takes positions on peace and environmental issues.

The signers of Charta 77 represent many different political views, and are far from unified on all questions. On the other hand nearly all of them are intellectuals. Charta 77 has never won support among workers or farmers.

The signers can generally be divided into three groups: Christians, cultural personalities and so-called Dubcek communists. For a number of years each of the three spokesmen has represented one of the three groups.

Today about 1,300 Czechoslovaks have signed Charta 77. Every month the number grows by three or four. For many the signing is their only action. The real activists are counted in the tens, not in the hundreds.

As a rule those who sign the Charta lose their jobs, they and their families are harassed by the police, and arrests occur.

Signing Charta 77 means that one is placing himself outside the main stream of Czechoslovak life. It means that he must support himself outside the community.

In 1978 Vaclav Maly signed Charta 77 and in 1981 he was one of its spokesmen.

Today he is 35 years old and a furnaceman at a hotel. But deep inside he is still a priest. A profession which he cannot practice officially--that would be breaking the law.

-0-

As for so many others it also began for Vaclav Maly at the end of the 60's. The young Maly was attending junior college and had plans to be an archeologist.

In 1968 Alexander Dubcek came to power and introduced extensive reforms. Czechoslovakia was going to build a socialist society with a human face.

"We thought that 'Springtime in Prague' was going to change everything. When the invasion came in August--when Soviet tanks rolled into Prague--there were many who gave up. They thought it all was in vain.

"But I said no. We must be able to fight. I had been a Christian my entire life, and now I was especially inspired by the evangelistic texts. I decided when I was 18 years old that I would become a priest."

After six years of study Maly graduated in 1976. He got a job as a prison priest and later as chaplain in a congregation in Prague.

"It was sometime in 1978 that I realized that I could not continue to work like all the others. I realized that I must preach the truth. As a priest I had to be interested in people's problems. I must become involved."

And Father Maly became involved. He began working for the Committee for the Defense of the Unjustly Persecuted (Czechoslovak abbreviation VONS) immediately after it was formed in 1978. And he signed Charta 77.

"I could do nothing else. We priests must also take responsibility here, and not just talk about salvation in another life.

"Within the church, however, they did not understand my decision. It was a crime to sign the Charta. Even Cardinal Tomasek was bitter. He said it was deceitful to mix earthly politics with religion. But now they understand me again. Now we are again on the same side."

In Czechoslovakia priests are paid by the state. And in order to practice as a priest one must have an official license. In this way the state can observe and control the church.

"In 1979 my license was taken from me. Officially it was said that it was because I had improperly performed my duties. But the real reason, which is not written down anywhere, was that I had great influence with the youths--many listened to me. And also that I signed the Charta and was active in VONS, of course."

-0-

In May 1979 Vaclav Maly was arrested. He was one of the critics of the regime who were taken in an extensive wave of arrests.

Maly and the others were accused of conducting destructive activities against the Czechoslovak Republic.

The wave of arrests also crossed the news threshold here in Finland. The trial later the same fall was reported in HUFVUDSTADSBLADET in the news and the editorial columns.

Most reporting, however, was about the writer and former Charta spokesman Vaclav Havel.

Because of his Charta activities Havel had been in prison most of 1977 and 1978. Now he was again among those being sentenced. He received four and one-half years in prison.

Vaclav Maly's name did not appear in the press. But he was also in Ruzyne prison in Prague with Havel.

"I was in prison for seven months. I was released in December and since then the police have always followed me."

-0-

During the time I was in Prague I met Father Maly twice. The first time we met at his home. He lives in one of Prague's southwestern suburbs, high up on a hill overlooking the river valley.

On the outside the house appears to be a neat single family house with flower beds and a trimmed lawn. There is a BMW and a large Skoda outside the garage. But the outside and the inside of Maly's house do not resemble each other.

In the two-story house there are four families, not just one. Maly lives with his father in one room.

In the middle of the floor there is a large table. One wall is occupied by a kitchen cabinet, a counter and a hotplate. Besides the table, the furniture consists of a couple of chairs, a bookshelf and a bed.

On the window sill there is a large radio-tape recorder. The walls are bare except for over the bed, where there is a picture of Madonna and a small crucifix.

Father Maly asked if I smoke and offered coffee. Before we began to talk he locked the door to the stairway and pulled the curtains.

I said something about the fashionable quarter in which he lived.

"Yes, that is true, from a material standpoint most people are well off. Nobody is starving."

Then why protest?

"Because everything is a game--a silent pact between the communists and the people. 'We will take care of the politics and you will become rich.'

"The people have no interest in social problems, only for themselves. Every day one can see how morality is being destroyed. Czechoslovakia is a country without morals, everybody steals from the system. Nobody takes responsibility, nobody is encouragesd to take responsibility.

"The people are cowardly. For example, if safety in a factory is deficient, nobody complains. If someone should complain he is in disfavor with the boss. If the boss finds the least little mistake on the part of the complainer he is transferred--possibly at a lower wage. The workers are more interested in their own wages than in the safety of others.

"In private and in the taverns everyone complains about the unjust and rotten system."

Maly does not expect a reaction such as the one in Poland. He says that extensive protests are not possible.

The living standard is so high that people do not need to feel solidarity. They concentrate instead on consumption.

When I asked him about his own political intuitions he burst out laughing. Then he pondered a moment and replied.

"I am an independent democrat who believes in social justice.

"And in our 'classless' society there is no social justice. There is an enormous chasm between the people and the party elite."

Do you believe that the chasm is greater here than in capitalist countries?

"I don't know. I do not know the conditions in your countries so well. But the situation in our country is a parody of marxism-leninism.

"The ideology as such is OK. But the theory promises something different from what we have in practice. Our leaders do not believe in any ideology--they have no morality and no belief. The only thing they believe in is leadership--their own leadership."

Father Maly says that he believes in the people, and all changes must come from the people themselves.

"Always when I meet people I tell them that they can do something, that it is their duty to stand up and speak out.

"People who work in commerce and are allowed to travel abroad should stand up and say, 'Not just us--everybody should be allowed to travel.'"

Vaclav Maly speaks rapidly and eagerly. Sometimes his English gets mixed up and he substitutes the word in German or French. He gestures with his arms and his glance moves constantly without pausing for long. A big smile dominates his round face. He laughs heartily and often. Since 1981 when he was a spokesman for Charta 77 he has not done much within the framework of the manifesto or in its name.

"Mostly I have worked in VONS, which has a more limited mandate. We support and defend those who are judged in clearly political trials. There are 80-90 such cases each year.

"We look for the reports of proceedings and other documents from the courts, we help the accused with their defense, write and appeal to the authorities, help relatives and friends, etc. It depends on the case."

In other words a kind of free assistance which operates on ideological grounds.

-0-

Vaclav Malỳ has paid a dear price for his activities. He cannot pursue his profession, he has been accused, imprisoned and mistreated. His mail is intercepted and some of it never gets through to him. For several years he has given up trying to get a telephone. Now he is most disturbed by being followed regularly by the security police.

"Sometimes there are two policemen and sometimes 10. They wait for me outside my job and follow me wherever I go.

"If I meet anyone, that person is thereafter called in for interrogation and harassment. They want people to avoid me.

"When I notice that I am being followed I avoid friends whom I know are unknown to the police.

"The surveillance does not follow any pattern. Sometimes I can go for a week without being followed, sometimes they are there several days in a row.

"I am sure that some of my neighbors also cooperate with the police."

Doesn't that make you paranoid?

"No, no, no, no," he said very quickly, and then laughed for a long time. Then he became serious again.

"I know that the risk exists, and I always try to work against it."

-0-

The highly notorious trial of the VONS and Charta 77 activists in October 1979 was the last of its kind. And the numbers of prisoners of conscience which Amnesty International works for in Czechoslovakia has declined from 35 in December 1981 to 14 in mid-June 1985.

The outward appearance is that developments are moving toward a more liberal and humane direction. The truth is something else.

Instead of long prison sentences for subversive activity, the civil rights activists get several days arrest for various small misdemeanors. Instead of large trials, a short two hours interrogation once a week.

The goal of the Czechoslovak regime is clear: to in every way limit and subvert the activities of the dissidents--without putting them in prison and without the negative publicity which this imprisonment causes. House searches and constant surveillance by the security police are effective methods.

If you can not put the people in prison, bring the prison to them.

-0-

Father Maly's contact with the outside world takes place through friends and friends of friends.

"I get news from the West mainly via LE MONDE which an acquaintance smuggles in for me. Newspapers circulate from hand to hand like Samizdat newspapers in the Soviet Union.

And via the radio. While I was visiting him Maly tuned in the news from Voice of America.

Do you listen to Voice of America regularly?

"Yes, if I can manage to be at home. But not only Voice of America, I also listen to Austrian Radio and BBC.

According to Maly over half of the Czechoslovak people listen to foreign radio stations and look at foreign TV.

"But they are too cowardly to admit it openly. Most of them inwardly support Charta 77 also, but they don't boast about that either. It is all a kind of double-dealing."

-0-

Three days later we met again. This time it was outside the hotel where Maly works. We had agreed that I would sit and wait on the steps of the church opposite the hotel. If he was being shadowed he would go past me without showing any sign of recognition.

"Hi, how is everything?"

"Fine, and you?"

"I was followed all day yesterday and the day before. Today there was nobody, you were lucky."

Maly does not want to remain long in the same place. We walked through the old town and down by the Moldau. By the river bank we passed the Dvorak Room where the same evening I was to hear a concert by the Czeckoslovak Philharmonic.

We discussed this and that. I tried to ask Maly about his views on world politics. We had talked a bit about this during the evening at his home.

"Communism is evil," he said.

You no longer believe in reforms as in 1968?

"I am a realist. Geopolitically we are a Soviet satellite, and to change that would be an enormous and slow process.

"Of course you understand what I mean. You in Finland must also glance in the direction of the Soviets. You are not free as is Sweden."

Reforms in the Soviet Union then, how would they affect Czechoslovakia?

Gorbachov is not a declared ideolog. He is a business manager. His goal is to strengthen the Soviet economy.

"But behind him there is still an ideology--the same old ideology. To support all communist revolutions and to rule the world. A better Soviet Economy means at the same time a better Soviet Army--also in Czechoslovakia.

"As long as communism exists there can only be room for limited freedom."

He ponders a moment and then continues.

"But I also approve of limited freedom, that is better than no freedom at all. For example, it is better in Hungary than it is here."

And also at Father Maly's home.

On the way up toward the view point where the statue of Stalin looks out over Prague, Father Maly repeats his views.

"But the world is not black and white. And I am not so naive. America has its own problems and there is much which is wrong there too. What Reagan is doing in Central America is wrong."

-0-

We reached the top and looked out over Prague's church towers and roofs. Although it was sunny one could not see very far. There is always a haze over the city--the air is among the dirtiest in Europe.

Father Maly's thoughts were far from Prague.

"At every interrogation they offer me the chance to emigrate. But I do not dare. Then I would never be able to return.

"I have never been outside of Czechoslovakia. Not even to other East bloc countries."

Theologian Vaclav Maly has received several invitations from foreign universities. For further studies. But he has always said no, thank you.

"Of course I would like to travel abroad. But only for a few years. To see how life is there."

Maly does not want to be away from Prague and Czechoslovakia. His life is here.

"I am a Catholic priest. I cannot leave my task.

"Although the political situation is going badly, I always have my faith and my studies to fall back on. And of course VONS. Today I learned about two new trials."

With mention of the two trials the sunny smile returned to Maly's melancholy face.

"Now and then I do various small jobs for the church. Of course, since I do not have a license it is prohibited--if I were permanent I could get up to two years in prison."

I carefully asked Father Maly if my writings were going to cause him problems.

"Perhaps, perhaps not. But write. Then people will know. I have nothing to hide, I work completely openly."

-0-

Maly has already overstayed his lunch hour, and wants to leave.

Do people recognize you on the street? Do they know that you are Vaclav Maly?

"No, they do not. At work they know that I signed the Charta. And the neighbors, of course."

What do they say about that?

"Support is always concealed. A pat on the shoulder here, a favor or the wink of an eye there. Not much, really."

Maly tells that the results of the Charta 77 text are mostly seen indirectly.

"When we send writings to the authorities about, for example, the dying forests, the immediate reaction is to call in the spokesmen for interrogation. The police want to know who wrote it, etc.

"But then after a while articles appear in the official propaganda organ. These articles take up the same shortcomings which the Charta writings pointed out."

We stopped for a moment on a bridge over the Moldau.

In almost exactly two months President Reagan and party leader Mikhail Gorbachov will meet in Geneva.

In the western daily papers which I have given to Father Maly, Reagan's aides say that they do not expect to allow Gorbachov to avoid the question of human rights in Soviet-dominated Eastern Europe.

Reagan, Shultz and company less frequently express themselves about human rights in El Salvador, South Korea, Chile and the Philippines. They only complain when they are not satisfied with the regime's domestic political orientation.

Human rights have become a political cudgel.

From that standpoint Vaclav Maly is fortunate. He is a critic of the regime in the right society. He has strong defenders.

-0-

Through the eyes of a tourist--seeing what black market currency can buy--the world in which Vaclav Maly lives looks totally acceptable. For him it is hell.

He could live comfortably in any West European city. He could also live comfortably in Czechoslovakia. But he does not.

Why do you make your life so difficult?

"I am a Catholic priest. I am just doing my duty."

The reply is direct, and when he says it he shrugs his shoulders, as if to say that it is nothing special.

Have you never thought of quitting--of just letting it go?

"No, never."

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

MINISTER SPEAKS ON NUCLEAR PLANT CONSTRUCTION FOR CEMA AND CSSR

Prague HOSPODARSKE NOVINY in Czech No 48, 1985 pp 1-7

/Article by Eng Eduard Saul, minister for metallurgy and heavy industry of the CSSR: "We Know Our Responsibility"/

/Text/ The Construction of Nuclear Power Plants

One of the fruitful fields of the Czechoslovak metallurgy and heavy machine industry has traditionally been the power machine industry. In line with the concept of the construction of nuclear power plants as a part of the development of power engineering in all CEMA member countries, our department was given a qualitatively new task--to create the conditions and ensure the production of equipment for nuclear power engineering. In the course of the Sixth and Seventh 5-Year Plans, we built the corresponding production basis for the VVER 440 nuclear power plants and became fully proficient in the manufacture of equipment for them.

For Us and For CEMA

Today, we ensure complete deliveries of secondary technological equipment for Czechoslovak nuclear power plants and for the blocks of the Seventh and Eighth Nord Nuclear Power Plant in the GDR. We also supply the basic supply equipment and special armatures for domestic needs as well as for the CEMA member countries. Thus we fulfill the agreement of the CEMA countries and the Socialist Federal Republic of Yugoslavia on multiple international production specialization and cooperation and mutual deliveries of equipment for nuclear power plants.

We are currently introducing the production of equipment for a new generation of nuclear power plants with the 1000 MW blocks. This mainly involves the reactors, steam generators, 500 J main circulation piping, turbines, and 1000 MW generators and special armatures for the containment layer. The bulk of the production of this equipment is handled largely by the Skoda Pilsen VHJ as the general supplier of the technology and by the Sigma and Vitkovice VHJs. Alongside the new tasks, the participation of other organizations of our department in the production of equipment for nuclear power is being broadened. Preparations are also being made for the manufacture of some new equipment, such as systems for highly effective filtration and ventilation, equipment for removing radioactive waste, various types of pumps, armatures, exchangers and special transformers.

Most of this equipment is of original Czechoslovak construction, and I am pleased to note that this equipment is of a very good technical level.

For example, mention can be made of the ZFA filtering equipment from Vzduchotechnika (Air Technology) in Nove Mesto na Dvahem, designed for multi-level filtration of radioactive aerosols in the ventilation systems of nuclear power plants, or the system of armatures for nuclear power plants from Sigma Modrany.

The K-155-80 calcinator from the Kralovopolske Machine Works in Brno is a progressive item of equipment that is fully comparable with top foreign products, and is an instrument designated for the elimination of fluid radioactive wastes, as well as other products from the organizations in the metallurgy and heavy machine manufacturing fields. A number of other new items of equipment are the subject of the tasks of the State Plan for the Development of Science and Technology. The manufacture of these items is being harmonized with the construction needs of the Temelin nuclear power plant and with future construction of similar nuclear power plants in the CEMA member countries.

Towards the end of the previous 5-year plan, the first two blocks of the V-1 nuclear power plant with light water VVER 440 reactors in Jaslovske Bohunice were built. The Soviet Union supplied the primary portion of these reactors. The secondary part was supplied by manufacturers from the area of metallurgy and heavy machine industry. The system of organization, construction, design and actual construction relied on significant help from the Soviet side, as well as Soviet supply organizations. The significant completion of the two blocks of the V-1 power plant in Jaslovske Bohunice is the result of lengthy joint cooperation with the USSR, while educating project and production specialists and specialists in the maintenance of complex nuclear power plant equipment.

The construction of other blocks for the VVER 440 nuclear power plants with V-213 reactors in Jaslovske Bohunice and in Dukovany began under the previous 5-year plan. On the recommendation of Soviet specialists, the technical concept of the construction as well as the technological part of these nuclear power plants were significantly altered as compared to the V-1 Jaslovske Bohunice plant. Equipment improving the reliability, safety and technical production characteristics of the blocks was added. This concept was accepted by other CEMA member countries, particularly the GDR for the second part of the Nord nuclear power plant, Hungary for Paks, and Poland for Zarnovec.

The unification of the projects for these nuclear power plants brought concrete results, reflected in the unified solution for the primary parts of the main production block, and enabled Czechoslovak machine industry enterprises to take part in production specialization and to export deliveries of decisive equipment. At present, deliveries of reactors and components have been completed for the fifth block of the Nord nuclear power plant, for four blocks in Paks, for two blocks in the V-2 in Jaslovske Bohunice, and for two blocks in Dukovany.

The Czechoslovak heavy machine industry has taken part in the delvieries of many other nonspecialized equipments for the construction of domestic nuclear power plants, which significantly lowered the imports. In this 5-year plan, the manufacturing of products for nuclear power plants will amount to approximately Kcs 13 billion, of which Kcs 4.1 billion will be exported.

In spite of some initial technical difficulties, all deliveries planned for the current 5-year plan will be met in harmony with the construction requirements of nuclear power plants at home as well as abroad, while meeting the demands for production quality and the quality of equipment assembly. A significant share in these results can be attributed to our metallurgical plants and metallurgical secondary production, which introduced the production of demanding types of steel and welding materials; thus, practically all the material needs for the nuclear power plants are met domestically.

Under the previous 5-year plan, the deliveries of our organizations to domestic nuclear power plants represented Kcs 788 million; for exports, the figure was Kcs 2,644 million. As opposed to the previous 5-year plan, in the current 5-year plan the rate of production growth for domestic deliveries is approximately 11-fold and the export index is 1.56. The approximately 12-fold increase in deliveries of equipment for nuclear power plants from our department is also a graphic illustration of our significant cooperation with the Soviet Union and other CEMA member countries.

Mistakes to be Avoided

However, the high dynamics of the equipment deliveries did not manage completely to fulfill the arrangements specified for meeting the deadlines for testing individual blocks in trial runs. This is true for the construction of nuclear power plants in Jaslovske Bohunice and Bukovany. Several times it was necessary to alter existing network construction timetables and correct subsequent deadlines.

Because of the cooperation of all construction participants, the specified deadlines for placing blocks into operation were met for the first time in 1984. The first block of the V-2 nuclear power plant in Jaslovske Bohunice was brought up for a trial run and the first block in Dukovany was prepared for being powered up. This year, in addition to the successful introduction of the first block into a trial run in Dukovany in May 1985, in September, 2 weeks ahead of deadline, conditions were created for making the second block of the V-2 nuclear power plant ready for the trial run.

The work to prepare for actual powering up of the second block in Dukovany towards the end of the year is successfully drawing to a close. Also in Dukovany, the construction organizations agreed to shorten the annual deadline between bringing blocks 3 and 4 up for trial runs (the third block 10 months and fourth block 7 months). Fulfilling this goal would make it possible to have a trial run of the third block in December 1986 and of the fourth in July 1987. Thus the conditions are being created to fulfill Decree No 167/1984 of the Cabinet of the CSSR Government.

In spite of these positive results, I cannot omit the fact that this amounts to meeting altered deadlines. In the construction of nuclear power plants, in the first years of the current 5-year plan there were serious slipups in meeting progress deadlines at both construction sites. Their causes must be eliminated in order that similar problems not recur in the construction of nuclear power plants in the next 5-year plan.

Improved Management and Planning

The factors impeding the steady construction of nuclear power plants were the subject of a more detailed analysis and are enumerated in Decree No 226/1983 of the Cabinet of the CSSR Government. On the basis of this analysis, a new system for monitoring the construction of nuclear power plants was accepted, including a specific designation of the authority and responsibility of all participants in the process, i.e., the investor, general supplier of the construction portion, and general supplier of the technological portion. Another new element is the systemwide approach to the monitoring of the entire construction, at the level of the vice chairman of the CSSR Government as well as that of ministers, the general supplier of technology, etc. The logical outcome of these accepted measures was improvement in the control and planning of this area in our department.

At our ministry, by Decree No 104/1984 of the Cabinet of the CSSR Government, a nuclear power section was established on 1 July 1984. Headed by the deputy minister, its purpose is to ensure the complex production of the equipment and construction of nuclear power plants. Furthermore, we decided to close the general management's delivery section at the Skoda enterprise--the general supplier of the technological portions--and to establish a Skoda power plant construction enterprise. In the course of 1985, construction plants were established at the nuclear power plants in Dukovany, Mochovce, and Temelin and, at the Skoda enterprise, capacities for the construction of nuclear power plants are being increased for export and repair purposes. A further step in improving our participation in the construction of nuclear power plants will be the establishment of an automated control system for all main activities of the general supplier of technology and the construction plants.

The main goal of the measures that we accepted is the complex and quality fulfillment of the function of the general supplier of the technology for Czechoslovak nuclear power plants at all stages of their construction. That means that, during the preproject and project phases, there is cooperation between the general project manager, investor, and general supplier of the construction part of the nuclear power plant. Furthermore, there is cooperation when ensuring and coordinating deliveries from domestic production as well as from imports, in organizing work and deliveries at the construction sites from the various final suppliers, in ensuring assembly of the equipment, and block lowering, including the completion and placement of the constructions into permanent operation within the planned deadlines.

One of the causes of construction delays for nuclear power plants is the complicated preproject and project preparation, caused above all by the insufficient number of qualified specialists for the project. In 1984 it was necessary to get help from project institutes of the department, particularly for the Kralovopolska engineering plant in Brno, and to accept measures to increase the permanent project capacity of the organizations of our department beginning in 1985 by 150 specialists, adding 50 each year until 1990. The increase in the number of specialists in the project phase will satisfy the increased demands resulting from the project planning of the Mochovce and Temelin nuclear power plants and the preparations for the construction of another nuclear power plant after 1985.

In the CSSR, project preparation for nuclear power plants is carried out in close cooperation with the Soviet general project manager. As a result, it proved necessary to adjust some Czechoslovak measures and thus adjust our work to the Soviet principles of projecting work and its division into phases. This is particularly true in the case of effectively dividing functional units into Soviet and Czechoslovak zones in the projection process.

Our department will ensure a multifaceted strengthening of discipline among the general supplier of technology and his final and other suppliers in all given areas of the organizational, technological and project aspects of the construction of nuclear power plants. Ongoing solving of disagreements should not be permitted to be necessary, particularly in the project and supply phase. Therefore, a measure was accepted to improve coordination of work between the general supplier of technology and his final suppliers. To aid this process, regular monthly meetings of the general directors are organized directly at the construction site. Each VHJ designates a specialized director who is responsible for coordinating and fulfilling the tasks associated with the construction of nuclear power plants.

The progress of nuclear power plant construction is regularly discussed at the monthly meetings of ministry heads with the general directors. The performance as regards meeting construction deadlines in the last 2 years justify the conclusion that we will achieve lasting improvement in the management of nuclear plant construction.

The principles of improving the complex performance of the activities of constructing nuclear power plants also demand that the plans for the construction of nuclear power plants be worked out more precisely. We are currently working on measures which would fulfill the goals of this document. The program of the Federal Ministry of Fuel and Energy for placing blocks into operation by 2002 is the basis for the domestic construction of nuclear power plants on the assumption that the necessary development of supplier capacity will be included in the Guidelines for the Preparation of the National Economic Plan for 1986-1990 and that it will include the necessary development of construction efforts for the Ninth 5-Year Plan as well. Here, the emphasis lies on the need to develop the future planning process.

We base this observation on the fact that preparation for the construction of a nuclear power plant demands at least a 15-year lead, since the average time for the construction of a block is 7 to 9 years and its manufacture and assembly require somewhere between 2 and 5 years. These deadlines will be used in the standardization documents prepared, which must be binding on the participants in the construction so that it is possible to plan equipment deliveries consistent with the average manufacturing and assembly time and with the timing of orders from abroad.

Many difficulties arise from the prolonged negotiations and finalization of annual construction programs, particularly because of the differing opinions of the investor and the supply departments about the volume of binding tasks under the State Plan for each individual construction. As a rule, these negotiations are not closed until the halfway mark of the average year. It also may happen that the volume of work and deliveries which the investor is demanding exceeds the volume needed for the fulfillment of all activities and progress deadlines in a given year. In my view, the decisive criterion in determining the annual volume of binding tasks under the state plan should be guaranteeing material fulfillment, progress deadlines and a valid construction process. According to Decree No 37/1983 Sb of the Federal Ministry of Finance on billing and payment for deliveries for capital construction and deliveries of geological works, which requires accounting for work and deliveries subsequent to the delivery of entire units and operational systems to the user, the very volume of the binding tasks of the state plan must be considered as one indicator of fulfillment of the annual task. On this assumption, the negotiations on the necessary volumes of work and deliveries can be carried out in the time frame required, before the closing of the annual plan, and the approved deliveries can be incorporated into the production on time, including the balances of technical supplies.

What Does the Future Hold?

In the 1986 plan, we are looking forward to the completion of the third block of the nuclear power plant in Dukovany and will continue to prepare deliveries for the construction of the first block of the nuclear power plant in Mochovce--particularly the deliveries for the general supplier of the construction, and we will continue to work on the preparation of the initial project for the first two blocks in Temelin. According to our calculations, in the next 5-year plan we should supply nuclear power plants and other construction associated with nuclear power plant equipment worth Kcs 23 billion, while the Federal Ministry of Fuel and Energy will require supplies totaling Kcs 24.075 billion. The discrepancy is the result of heretofore inaccurately estimated construction costs owing to our currently insufficient knowledge of domestic and foreign supply prices, which have not affected current construction. In order to make exact cost estimates, it is necessary inter alia to quickly work up documented prices and approve the standardization documents for the cost estimating of work--price charts.

I do not consider the volume differences to be serious problems, but I do think that one problem is the fact that the need for deliveries and assembly tends to bunch toward the end of the Eighth 5-Year Plan. From a delivery level of Kcs 2.8 billion in 1986, demands will soar by 1989 to more than Kcs 6 billion. Our analysis shows that, according to the demands of the Federal Ministry for Fuel and Energy, the volume of deliveries, totaling Kcs 1.5 billion in 1989 and Kcs 1.9 billion in 1990, cannot be handled with currently available capacity in the field, particularly in the case of assembly. The problem is that project preparation and construction at the nuclear power plant in Mochovce are delayed, raising problems in connection with the work at Temelin toward the end of the Eighth 5-Year Plan and in the 1991-1992 period.

In the next 5-year plan, we are supposed to supply equipment to other socialist countries for nuclear power plants totaling Kcs 8.5 billion, representing deliveries of reactors and turbine systems for two blocks in the GDR, two reactors for Poland, and approximately Kcs 2.7 billion worth of deliveries of special armatures to the USSR, Bulgaria, and the GDR.

Also, in the case of export deliveries of two VVER 1000 reactors to Bulgaria and Romania, problems occur in the unequal distribution of the production because of delays in the preparations of construction in these countries.

In the remaining period for producing nuclear power engineering plants for the next 5-year plan, it will therefore be necessary in all areas to ensure that the manufacturing of equipment is consistently in line with the level reached in the current 5-year plan, which should occur even as if it is necessary to produce items in advance and temporarily to store deliveries for construction projects which have been delayed. In time, it will be necessary to eliminate the capacity disproportions in the assembly volumes of Czechoslovak construction by systematically strengthening the final suppliers.

Goals Set

Power engineering is the basis for the development of national economy of every industrially and socially developed country. We consider the development of nuclear power engineering and of the nuclear machine tool industry associated with it, together with proper rationalization of fuel and energy consumption, to be a decisive factor in fully satisfying fuel and energy needs. Critical evalation of the course of work at the nuclear power presented at the 10th Plenum of the Central Committee of the CPCZ, was positively reflected in the measures taken to speed up construction. There was improvement in fulfillment of deliveries of technological equipment to construction sites, improvement in the work at the construction sites, and a better approach of all workers to the fulfillment of their tasks.

Thanks to a long-term cooperation with the Soviet Union and other CEMA countries, an entirely new field has developed in Czechoslovakia in the last 10 years: nuclear machine engineering. There has been an influx of many young specialists, workers and technologists involved in production, construction, and in research institutes. The provision of 1,760 MW of new resources from nuclear power plants within this 5-year plan puts our country in second place behind the USSR among the CEMA countries.

At the 15th Plenum of the Central Committee of the CPCZ, the general secretary of the Central Committee of the CPCZ, Comrade Gustav Husak, emphasized the higher level already attained under the current 5-year plan and the elaboration of the tasks up to 2000. The need for devising long-term programs for the cooperation with the USSR and other CEMA countries is fully valid for nuclear power engineering as well. Therefore we can only be happy that, together with the Efficiency Council of the CEMA, we have worked up and accepted a program for the construction of nuclear power plants through 2002, which is also the *basis for our further work.*

The tasks set by the 15th Plenum of the Central Committee of the CPCZ deal with improvements in the quality of the style and methods of work and general management in the area of nuclear power engineering. We are all fully responsible for the resources provided for the development of nuclear power engineering and their utilization.

Activities at the nuclear power plants in Jaslovske Bohunice and Dukovany proved that the personnel in production and construction are appreciative of the evaluation they have rightly received from the highest party and state authorities. Using the initiatives of the working groups, the measures for developing socialist competition were deepened, as was the commitment movement honoring the 17th Party Congress, in order to accept joint socialist commitments. I sincerely honor the devoted work of the people in the constuction of nuclear power plants as well as other related works. I am convinced that the experience we have gained at all stages of our work on nuclear power plants will be fully utilized for the timely and proper fulfillment of tasks in the construction of nuclear power plants under the Eighth 5-Year Plan and in the future as well.

ECONOMIC STRATEGY FOR SECOND HALF OF EIGHTIES ANNOUNCED

Prague PLANOVANE HOSPODARSTVI in Czech No 8, 1985 pp 1-7

[Interview by Engineer Vaclav Vertelar, first deputy chairman of the State Planning Commission: "On the Project of Economic Strategy for the Second Half of the 1980's"]

[Text] The fundamental, lasting goal of our economic policy is to ensure a planned, dynamic development of national economy, which must be based, however, on far more determined and expeditious implementation of our party's strategic program of economic intensification, and on higher efficiency, social productivity and quality of labor. We see the main purpose of this effort primarily in further improvement of our people's living standard, in their greater security of life and social welfare, and in the creation of increasingly favorable conditions for a harmonious human development. Before us loom long-term tasks of shaping and completing the formation of a socialist way of life and at the same time, of enhancing the dynamic effect of our living standard on our economic growth, and on strengthening the socialist principles of reward as one of the basic characteristics of social justice. The qualitative changes in the structure of material and cultural needs of our people impose increasingly high demands on the quality and choice of industrial goods and food, on the standard of operations in trades and services, on transportation and other areas on which our people's satisfaction depends. We must keep improving our housing, health care and education, and increasing social welfare. We must proceed more vigorously with the solution of environmental problems. These directions set the ways which we shall follow and which will find a place of importance among the documents of the 17th Congress.

From the report presented at the 16th session of the CPCZ Central Committee by the general secretary of the CPCZ Central Committee, Comrade Gustav Husak.

The works connected with the preparations for the Eighth 5-Year Plan were organized on the basis of CSSR Government decision No 262/1984 on main directions for the socioeconomic development of the CSSR until 1990 and on the directive for the drafting of the proposal for the Eighth 5-Year Plan on the CSSR's national economic development for 1986-1990. This decision outlined the primary objectives, tasks and schedules from which appropriate administrative agencies will proceed when drafting their proposals for the Eighth 5-Year Plan. The assignment of the directive for the 5-year plan for 1986 provided at the same time an orientation for the preparation of an operational plan for next year. The agencies of the middle management level presented their proposals on 31 March and central agencies on 31 May of this year. It is envisaged that on the basis [of those proposals and in cooperation with the planning commission of the republics, in linkage with the final results of the coordination of the 5-year plans for the next 5-year period with socialist countries, the State Planning Commission will draft a proposal for the Eighth 5-Year Plan at the end of this year.

The experience from the drafting and implementation of the current 5-year plan has underscored the urgency of a goal-oriented method during the period of transition of our economy to intensive development. This is no ephemeral issue. This task cannot be resolved without setting up long-range goals ad objectives for gradual restructuring of our national economy on a qualitative higher R&D level. For that reason the preparations for the next 5-year plan are an integral part of the system stipulated by our government for the process of planning when drafting state plans for the development of national economy and when setting up a long-term socioeconomic strategy.

In our 5-year plans we intend to proceed consistently from the main directions of the socioeconomic development for a 10-year period. These basic directions should be determined on the basis of prognoses for the next 20 years. The first summary prognosis for the socioeconomic development and R&D, according to the approved project, will have a timetable to the year 2010 and will be processed in 1985-1988.

We envisage that the prognoses will contain the formulation of our long-term socioeconomic strategy based on objective laws for comprehensively developed socialist society in specific historical conditions of the CSSR; that they assess the changes in the external and internal conditions for a long-term development, and determine main economic objectives based on the future needs of society. Practical application demands that a comprehensive prognosis, assigned to the Czechoslovak Academy of Sciences, explain and recommend on the basis of science the variations of a long-term stable, dynamic and balanced national economic development. This calls above all for the determination of variants and conditions for high-grade economic intensification, for comprehensive utilization of sources of efficiency in production and of social productivity of labor, based on the linkage of the R&D revolution with the benefits of our socialist administration. We must demand that the prognoses compare not only our socioeconomic standard--the standard of the R&D base and the conditions of production in given time projections--with the foremost world states, but also the ways and means to secure the CSSR's place among those states, first of all, that the CSSR's place and task in world division of labor, particularly in the socialist community, be specified.

Although the above-mentioned prognoses may not be thoroughly and fully applied until the Ninth 5-Year Plan is drafted. the results of the works conducted thus far in this direction are already being fully utilized. This is an important step in interrelating science and research with practical planning.

To Intensify Positive Trends

The preparations for the Eighth 5-Year Plan focus on consolidation and further development of the positive tendencies of the successfully completed Seventh 5-Year Plan and on conceptual objectives and goals set by the 16th CPCZ Congress. The tasks of the Congress and of the Seventh 5-Year Plan followed from the comprehensively assessed new external and internal situation in the late 1970's, giving priority to a gradual restoration of the external and internal balance, to the elimination of disproportions. and to a harmonious development, rather than excessive stress and disproportionate dynamism. For that reason a lower rate of dynamism was planned for the first 2 years (1981-1982), while the target for the second half of the Seventh 5-Year Plan was deliberate reduction of our foreign debt.

After the 16th CPCZ Congress a factor with a long-term effect clearly emerged in the form of the further deterioration of the situation abroad (aggressive policies of the US imperialist circles, the consequences of the "second oil shock " the crisis of the international financial and monetary system, etc) and of the development or continuation of our domestic shortcomings (nonfulfillment of tasks stipulated by the investment plan, poor harvest, etc). It appeared imperative to step up the process of intensification and debt-reduction and at the same time, to continue aiming at the realistic fundamental goal set by the 16th Congress: to maintain the relatively high standard we had achieved, to improve its quality on the basis of our national economic achievements. and to consolidate our people's social welfare. Numerous relevant policies focused primarily at substantial cuts of expensive imports from the capitalist states were adopted. Therefore, some quantitative tasks contained in the law on the Seventh 5-Year Plan (December 1981) and especially in the approved Seventh 5-Year Plan (May 1982) were lower than those set by the 16th CPCZ Congress, particularly in the first two years. Starting in 1983. the plan already foresaw the annual tasks and dynamism set by the Congress.

The concepts and objectives are being fulfilled in the creation of NI as well as in its domestic use. as confirmed by some basic data concerning the tasks and this year's projected actual situation (in percent):

Table 1.

	Growth in 1981-1985 according to		
	the 16th CPCZ Congress	Seventh 5-Year Plan	projected effect for 1985
Gross national product	14-16	9.3	11.0
Gross industrial production	18-20	13.4	14.0
Gross agricultural production	10	5.2	9.3
Consumed NI	3.8	-1.7	1.8
of which:			
Personal consumption	0-3	3.0	5.7
Public consumption	13	12.0	21.6
Investment resources	0	-9.8	-3.1

We have achieved these results while gradually enforcing the strategic line of the CPCZ's economic policies aimed at an intensified development of our economy and at upgrading its efficiency. As compared with the 5-year plan, the drop in the share of material costs in outputs gained the greatest momentum, while relative savings in the consumption of primary resources of fuels and energy and of certain other raw materials and supplies increased. Therefore the results achieved justify the stipulation of even more rigorous tasks for the Eighth 5-Year Plan.

Concepts for the Drafting of the Eighth 5-Year Plan

The crucial point of departure for the drafting of the Eighth 5-Year Plan is the general policy for the building of a developed socialist society, elaborated by the 14th CPCZ Congress and applicable over an extended period.

Accordingly, the primary goal for our national economic development over the next 5-year period is to satisfy our people's material and cultural needs and to provide them social benefits; this will require a number of structural changes stemming mainly from the growing demands on quality, the technical standard and selection of goods in our domestic market, as well as on the expansion of paid and free services. An integral part of the living standard is the solution of the increasingly urgent needs of a good environment, which pose higher demands on the amount of investments as well as on scrupulous compliance with ecological considerations when making decisions on the further development of production, production technologies and the most suitable ways of fulfilling the production and nonproduction needs.

With respect to the development of the foreign and domestic situation and of world economic trends as a result of a rapid R&D advance, the fulfillment of this pivotal goal for the Eighth 5-Year Plan will depend even more on the consistently enforced strategic policy of economic intensification, greater efficiency and better quality of all labor.

Thus, the Eighth 5-Year Plan is a period of comprehensive intensification of production; it applies the achievements of R&D in the process of production and uses the stockpiled inventories as its economic resources, so as to generate a dynamic growth of production by means of greater efficiency, quality and economy. That is the prerequisite for a further rise of our people's living standard, for the continuous process of consolidation of our external balance, and for more dramatic updating of our R&D base, which will produce the required results over an extended period.

From the review of foreign and domestic conditions for our further economic development it followed that in the second half of the 1980's--with greater economic pressures on the application of intensive growth factors--the envisaged annual growth of our gross NI is 3.5 percent, while in the Seventh 5-Year Plan its average annual rate was projected at 2 percent.

The concept of the next 5-year plan concerning accumulation of assets proceeds from the premise that our material consumption in the creation of NI will be relatively conspicuously cut. In view of our limited options for further increases in deliveries of raw materials and fuels for our domestic consumption from imports and from our domestic resources, it is necessary to ensure that the range of relative savings of most basic raw materials per unit of created gross NI be close to the rate of growth of NI and even higher for certain materials. In agreement with that premise it is envisaged that the share of consumption in production of special products may be cut even more drastically than projected for the Seventh 5-Year Plan.

That is a most challenging task, as a comparison with the current year may confirm. Efficiency indicators in this year's plan are far more demanding than in previous years, which may be explained by the fact that this year's tasks in intensification of the economic growth have approached the parameters of the Eighth 5-Year Plan. In a way, this is a test run for the Eighth 5-Year Plan, necessary for a smooth transition to the fulfillment of the challenging tasks for the CSSR's further socioeconomic development. Specifically, it is reflected in the fact that this year, with the same rate of growth of NI as in 1984, i.e., 3.2 percent, our industrial production should be down 1.5 percent (last year's growth down 3.6 percent), and construction programs will be up 0.9 percent (last year 1.9 percent). The share of production consumption in net material products will be cut roughly twice faster than last year and substantially more than in the first years of the Seventh 5-Year Plan.

All analyses of consumption of power and materials, labor productivity, use of capital assets, application of R&D achievements, and others prove beyond any doubt that these tasks are not unrealistic. Our untapped resources of every kind are fundamentally greater and offer opportunities for accelerated intensification in the coming years. The problem is that the management on all levels has not made the necessary breakthrough in thought and especially in practical actions. Most attention is still focused on the amount of production, rather than minimization of cost per unit of production, quality, high technical and economic standards of the goods, their systematic updating, flexible adaptation to foreign and domestic markets, flawless commercial operations, including reliable services and continuous availability of spare parts.

The focus on an intensive national economic development demands that all necessary preconditions be provided for an expeditious introduction of current R&D achievements in the process of production and in our social practice. To that end it is imperative to ensure first of all the greatest possible growth of production based on the application of completed R&D programs, to apply widely noninvestment innovation processes and at the same time, to organize investment projects to update goods and technology, to develop licensing policies, and to encourage the improvement and invention movement and make use of it.

An accelerated dynamism of our economic development calls for the introduction of the most advantageous structural changes, which will enable us gradually to reduce the consumption of materials, energy and investments in production.

In conjunction with the measures adopted already during the Seventh 5-Year Plan, it is envisaged that the growth of production in branches of industry with high consumption of power and materials, particularly metallurgical production, the energy-intensive branches of our chemical industry, and our construction materials industry, further decelerate. In other words, their consumption must be cut as much as possible and their exports gradually tapered off.

Because we must process accessible material inputs to a greater advantage. it is necessary, on the other hand, to expand the share of processing branches, above all, of engineering, especially electronics, in the total volume of our production as well as in total international trade. One of the most important conditions for the development of those branches, however, is above all the task to increase their ability to compete in world markets, which presupposes a higher order of technical and innovating standards of such goods and more flexible services in relation to their exports. Our chemical industry will give priority to the development of less energy-intensive branches of high-grade low-bulk chemical production with higher processing of raw material inputs.

The key task of the branches of light and wood-processing industries and of most other processing branches is to improve the value of manufactured goods on the basis of a considerably increased share of top quality products, fashion novelties and luxury goods, and of corresponding innovations of production programs, as well as the necessary modernization and remodeling of their production base.

In order to speed up the transition of our economy to predominantly intensive development, all the most important factors determining the economic growth must be employed to far greater advantage, which means to introduce realistic methods for a comprehensive, more expeditious reduction in the consumption of power and materials in Czechoslovak economy than thus far, and for more rational exploitation and the highest possible processing of consumed inputs of power, raw materials and supplies.

The preferred focus of capital investment must be on the renewal and modernization of the existing facilities as the main prerequisites for better utilization of capital assets and at the same time, also on expeditious introduction of R&D achievements into production. Programs and construction projects which are characterized by rapid paybacks and maximum efficiency must be given priority and all opportunities for increasing production by means of changes in production programs in underutilized existing facilities must be exploited. Every effort must be made to cut construction schedules even more drastically and to reduce the excessive rate of unfinished construction projects.

The decline in the efficiency of capital assets must be slowed down considerably and efforts must be made in production in general to stop it completely.

Under the conditions of the Czechoslovak economy a conspicuous turn to intensive development is closely connected with the extent to which the CSSR has joined international division of labor, particularly socialist economic integration. In the future the major role here will be played by the development of our economic cooperation with the USSR. Dynamic growth of mutual exchange of goods and services will therefore call above all for further intensification of trade between branches and department subdivisions. Intensively expanded specialization and cooperation will provide advantageous conditions for programs of mass production and improve their efficiency. The development of mutual economic cooperation with the USSR demands that the structure of our production and exports be far more consistently adapted to the needs of [the USSR's] economy and their qualitatively higher standard.

A vital prerequisite for benefits from international division of labor, in relation to socialist as well as nonsocialist countries, continues to be better exportability of our goods, based on particular on a higher technical standard and quality of consumer products, among them above all machinery and equipment as a decisive precondition for their more advantageous price in foreign markets. Appropriate regulations of the territorial thrust of foreign trade, more efficient commercial policies and better economic cooperation and collaboration in production should also contribute toward that end. By the same token, it is envisaged that our trade with the developed countries will be expanded and that we shall import simple finished goods in exchange for our exports of machinery and equipment.

The pivotal goal of our socioeconomic development is to ensure the further growth of our people's living standard and to strengthen their life securities and social welfare. The main directions and the course of its development in accordance with the CPCZ's long-range strategy are focused on the consolidation of the qualitative balance and on the development of methods leading to more distinctively amalgamated interests of the individual with the interests of our society. For that reason it is envisaged that personal consumption will rise. The fulfillment of this goal is predicated on the qualitatively improved structure of our people's consumption, based on increasing availability and a wider choice of technically superior industrial goods and food. At the same time, the structural balance of our domestic market must be strengthened so as to stimulate the growth of substantive involvement.

While our people's public services consumption is rising proportionally--due to better rationalization and economy--most attention is focused on the development of public health care, institutional care for the elderly and disabled, and on education of the classes of children born in high birthrate years.

An essential factor in the further development of our living standard involves the solution of our pressing ecological problems demanding drastic measures for better protection of the environment and water purity, particularly on the basis of new construction projects and remodeling of the existing facilities; obsolescent, ecologically harmful technologies will be replaced with more efficient economic mechanisms.

The tasks for the next stage are challenging, yet inescapable. Without additional resources our living standard cannot be adequately improved, ecological problems cannot be dealt with, and our material-technical base cannot be rebuilt on a qualitatively higher level. These tasks are realistic from the viewpoint of the untapped resources available in our economy--i.e., in the consumption of energy, raw materials and supplies, in the use of capital assets, or the tremendous expertise and skills of our working people. However, they depend on preconditions expeditiously provided for the fulfillment of our demanding tasks and on the utilization of the above-mentioned hidden resources, which means that the tasks of this year's plan must be consistently fulfilled and that a high-quality plan be prepared for 1986, the first year of the Eighth 5-Year Plan.

Thus far a number of serious shortcomings have been pinpointed in the fulfillment of the plan. Qualitative indicators have not been appropriately met; efficiency of production has not improved according to the plan, and individual enterprises and plants continue to deal with their tasks in a haphazard and erratic fashion. Time is being wasted here; decisions must be made and measures adopted to eliminate the shortcomings and to fulfill all planned tasks. Only then the conditions required for next year's tasks will be created, which already constitute an integral part of the challenging concept for the Eighth 5-Year Plan discussed at the 15th session of the CPCZ Central Committee and as emphasized in the report of the general secretary of the CPCZ Central Committee and president of the republic, Gustav Husak.

APPROACHES TO LONG-TERM STRUCTURAL CHANGES IN ECONOMY VIEWED

Prague PLANOVANE HOSPODARSTVI in Czech No 9, 1985, pp 10-13

[Article by Eng Vaclav Glaser, ScC, State Planning Commission: "Some Approaches to Long-Term Structural Changes of Czechoslovak Economy"]

[Text] The main directions for the economic and social development of the CSSR until 1995 focus considerable attention on a gradual structural transformation of Czechoslovak economy. The period after 1985 is regarded as a stage of a thorough transition from an extensive to an intensive type of social production on the basis of accelerated maximum exploitation of R&D achievements and enforcing of distinctly stepped-up intensification of economy, higher efficiency and better quality of all labor, and greater participation of the CSSR in international division of labor, primarily with the CEMA states and most of all, with the USSR.

The prime objective for the second half of the 1980's is to utilize the relatively extensive accumulated untapped assets on the basis of technical, investment and structural measures prepared in the first half [of the 1980's] and of drastically more economical processes of production. After 1990 the main source of growth will be the results of innovations of goods and technological processes as well the intrastructural changes stemming from far-reaching general penetration of advanced directions of modern R&D achievements (electronization, robotization, biotechnologies) into national economy.

It will be expedient to base the implementation of a dynamic and efficient development on better processing of inputs in economy and on achieving high effects of production on the basis of a higher rate of innocation processes leading to universal convertibility of a relatively limited spectrum of products. The achievement of this long-term objective is further determined by a narrower line of goods with an appropriate focus of the R&D base on a limited scope of problems, and thus, by substantially higher integration in international division of labor, which will permit us to cover a broad range of our import needs with specialized exports.

The solution to the problem of greater economy and better processing should be expressed in a synthetic form as a lower share of consumption in production of net material product, which will decline by 2 points over the 10-year period. The challenge of this task stems not only from the fact that this involves fundamental acceleration of the heretofore development in the Seventh 5-Year Plan, but also from the fact that at the same time the rapid development of foreign and domestic specialization and cooperation in production is emphasized in the processing industry, primarily engineering and electronics; thus far this factor has not quite justifiably affected the increasing consumption in production. In conjunction with the reduced share of consumption in production great demands are made especially to reduce the consumption of energy and metals in national income.

The emphasis on structural changes in the Czechoslovak economy, resulting in more economical consumption, and efficient marketing of Czechoslovak goods in world markets, was also included in the decision of the CSSR Government No 262/84 on "Main Directions," which calls for greater specification of the prospects for the development of individual branches of our industry, aimed mainly on drafting proposals for gradual structural transformation of those branches in favor of a preferential development of those branches in favor of a preferential development of those branches and productions whose requirements of energy, materials and investments are low, and in conjunction phasing out of branches and productions whose characteristics of those criteria are unfavorable, so that, in general, the current line of products be narrowed down.

The demands on such proposals for structural transformation of the branches of our industry have been specified; in the framework of the problems under discussion the central agencies in charge must elaborate and propose solutions to key problems in the structure of production according to the method outlined here below:

--to define the main objectives of the long-term development of branches of industry in relation to the needs of our national economy; to formulate the objectives of the gradually narrowing line of products on the level of branches and branch divisions, based on accelerated integration in international division of labor, which must be accompanied by a focus on R&D capacities, investments and work forces, namely, on those branches and goods where we have optimum conditions for achieving high utility value and general efficiency of production;

--to assess long-term domestic and foreign conditions for the structural development of production, among them stagnation of material and power inputs, a slow growth of investment inputs, and the projected development of the competition and of demands in world markets;

--to specify the methods for more efficient mass production programs (for example, of passenger automobiles, tractors, equipment for nuclear power plants, chemical equipment in engineering, electric engines and cables in electrical engineering industry);

--to assess the potential for increased exports, particularly in relation to the CEMA, methods to determine national economic needs for limited lines of goods (to guarantee a balanced economic development); to recommend main directions for structural integration of the branches into international, primarily socialist, division of labor, with regards to realistic opportunities for adapting the structure of goods offered by the CSSR to the changing demands of the world market;

--to assess preconditions for higher labor productivity from the standpoint of increasing utilization of electronics and robots in processes of production, with regards to the growing sources of work forces in the Eighth and Ninth 5-Year Plans;

--to assess the objectives, tasks and general orientation of the long-term comprehensive programs;

--to specify the problems of modernization of the production base and of better utilization of the increasingly sophisticated machinery inventory by higher use of shift work and by an optimum expansion of the pre-production stages of the R&D base;

--to propose tasks for R&D for structural transformation;

--to provide guidelines for the requirements of other branches of national economy on the basis of the development of the branch's structural profile;

--to make comprehensive assessments of the resulting proposal for the structural profile of individual branches of Czechoslovak industry, the degree to which it covers the needs of our national economy overall as well as according to individual areas (national economic conglomerations and cross sections).

Thus, the proposals for structural transformation of individual branches will provide convincing information about the development--or as the case may be, about the phasing out--of the planning groups and key branches and of the goods produced by a given branch, including the requirement of necessary capital investment justified by the criteria of current and future efficiency of such productions.

The underlying question is whether an adequate space is available for more drastic reductions of the share of consumption in production in net material product and for higher net profitability of Czechoslovak exports in foreign currency--in other words, the difference between profitability of foreign currency and comprehensive import requirements--by means of changes in the structure of production on the level of branches, planning groups, departmental units and departments.

For illustration of one of the options--material consumption in production without depreciations (direct and compounded, i.e., including those incurred in all preceding and subsequent productions) and net profitability of foreign currency were quantified on the basis of interdepartmental accounts for 1982 rendered by 40 departmental units. In particular, departmental units of the processing industry may be compared one with another. Considerable differences between individual departmental units may be graphically documented by inclusion of deviations from average (material) consumption in production and average net profitability of foreign currency for the entire production sphere (whose value may be regarded as 100 percent).

Departmental unit	Consumption in production (material)		Net profitability in foreign currency
	Direct	Compounded	
Products of vegtable origin	81.0	81.3	111.8
Animal products	114.9	127.9	89.9
Forest economy	39.9	39.1	168.0
Solid fuels	83.1	84.2	174.0
Gaseous fuels	88.0	73.3	189.4
Crude oil	36.6	33.9	--
Energy	110.9	101.3	139.1
Ore mining and refining	138.1	129.1	26.2
Ferrous metallurgy products	132.3	230.4	89.7
Nonferrous metal products	123.0	179.1	83.3
Chemical products	123.6	93.0	79.2
Rubber and plastics	108.7	111.6	84.4
Pharmaceutics	100.1	90.1	161.1
Engineering elements and components	98.2	130.5	130.3
Heavy-current engineering products	105.2	110.9	146.4
Electronic goods	81.2	74.6	170.0
Measuring instruments, general tools	91.8	123.3	161.7
Products of automobile industry	108.7	132.1	152.1
Products of transportation engineering	97.5	111.9	146.9
Machinery for processing industry	86.5	106.5	234.2
Machinery for heavy engineering	100.9	128.7	191.3
Machinery for nonproduction use	102.7	120.6	108.3
Assemblies	64.9	78.6	153.9
Construction materials	95.8	92.4	135.4
Products of wood-processing industry	103.9	98.2	117.2
Paper and cellulose	116.0	123.6	90.4
Glass, porcelain and ceramics	81.9	74.1	143.6
Textile goods	114.1	115.9	81.8
Garment industry goods	96.7	110.2	71.4
Leather goods	108.2	116.2	133.5
Typography	83.3	83.9	109.5
Slaughter and meat products	140.5	180.3	63.9
Dairy products	139.3	163.8	53.9
Alcoholic beverages	112.3	115.0	118.7
Other alcoholic products	127.7	135.0	69.4
Industrial fodders	137.8	125.8	--
Other products	70.6	73.2	126.2
Construction industry	82.7	92.9	149.3
Transportation and communications	45.3	44.0	137.8
Financial branches	37.1	26.0	--

The data presented in Table 1 unambiguously prove considerable variability in the requirements of consumption in production (materials) as well as net profitability of foreign currency among individual departmental units of the production sphere, with relatively distinctive indirect dependence of both those criteria. So long as in the post-1985 period structural shifts--for example, within the industry in favor of electronic products, machinery for the processing industry, pharmaceutics, glass, porcelain and ceramics--may be technically and economically identified, assessed from the viewpoint of markets and implemented, and concurrently, the share of productions with high material consumption, such as ferrous and nonferrous metallurgy, may be reduced, the changes in their sum total should be expressed in a smaller share of consumption in production in net material production and in substantially higher profitability of exports in foreign currency.

Similar possibilities exist in individual departmental units due to sizeable difference between individual departments in characteristics of material consumption and net profitability of foreign currency. As for chemical products, some departments of chemical specialties, such as organic dyes and pigments, textile and leather-processing products and pure chemicals, have relatively low values of said characteristics.

Among machinery units and components, primarily hydraulic units and equipment, pneumatic units and equipment and transformer equipment have consumption of materials and high profitability in foreign currency. According to those criteria, the most advantageous among electronic products are semiconductor elements, microelectronic conjugate circuits, electronic measuring instruments, scientific and laboratory equipment, automatic regulation and control equipment, equipment for reproduction, and automatic control systems for processes of production. Among machinery for processing industry industrial robots and manipulators, processing machinery, machinery and equipment for glass, textile, leather-processing and typographic industries, particularly machinery and equipment for engineering production, have the lowest material consumption and the highest net profitability of foreign currency; machinery and equipment for processing of rubber and plastics require low material inputs. In the same manner the internal structure of other departmental units may be assessed with the application of inter-departmental accounts for 1982.

In general it may be said that a space exists in the departmental structure of Czechoslovak economy, especially in processing industry, for progressive structural changes with a positive impact on reducing the share of consumption in production and on more lucrative foreign economic relations. Among the obstacles to an accelerated development of departmental units and departments with favorable values of those characteristics are--in addition to problems with phasing out of inefficient departments which are drawing off excessive material, power and investment inputs--particularly the difficulties in marketing of our goods in foreign markets. This seemingly paradoxical situation stems from the fact that in world markets of advanced products we encounter competition of the most developed countries which come there with goods of excellent quality and of high technical parameters. The only long-term solution to this situation may be the focus on holding our place in this market by offering a more limited, specialized line of goods of top standards. The shift to the less demanding lines of production would make it impossible to achieve the challenging aims of foreign and domestic efficiency contained in the basic directions for the CSSR's economic and social development.

Practical implementation of structural changes goes hand in hand with the application of the goal-oriented approach. Systems of state goal-oriented programs and state R&D programs represent the essential mechanism for an efficient gradual structural transformation of the Czechoslovak economy.

NEW FINANCIAL RULES FOR EIGHTH 5-YEAR PLAN PUBLISHED

Prague HOSPODARSKE NOVINY in Czech No 50, 1985 p 5

[Article by Eng Stanislav Sourek, deputy minister of finance of the CSSR: "Khozraschet Characteristics Emphasized"]

[Text] In the supplement to this issue we publish the full text of two amended financial regulations applicable as of 1 January 1986. The author of this article describes the main changes that will be implemented on the basis of these (and other) regulations in the financial management of the VHJ's [economic production units] and enterprises during the Eighth 5-Year Plan.

The development of the financial management system continues, while its efficiency is improved by further intensification of its khozraschet characteristics. The new financial regulations which proceed from this basic approach involve adjustments in the financial management system of the VHJ's and enterprises in the Eighth 5-Year Plan, namely:

-- partial amendment to CSSR governmental decree No 161/1980 of the Collection of Laws on financial management of the VHJ's and enterprises (published in the supplement);

-- partial amendment to announcement No 162/1980 of the Collection on financing replacement of capital assets (published in the supplement);

-- new announcement on financing of current assets;

-- new announcement on financing of non-investment expenditures for R&D (No 118/1984 of the Collection, issued previously and applicable already as of 1 January 1985, published in the supplement to HOSPODARSKE NOVINY No 49, 1984).

The actual impact of the financial plans on all levels of management on other parts of the plan is of vital importance both from the standpoint of the financing of basic needs of the VHJ's and enterprises and from the standpoint of the planning of the accumulation of financial assets (especially profits). Nevertheless, ample untapped resources still exist in these relations. For the future it will be imperative for the financial plan to include in the accumulation of assets consistently, for example, R&D contributions, better exploitation of capital assets, new investments, efficient management of inventories, reduction of administrative costs, and achievements of foreign trade.

Payment of Depreciations

The weight and thus, also the importance of disposable profits as the source for the financing of the needs and demands from the material incentive system of the VHJ's and enterprises have been upgraded in financial resources for the Eighth 5-Year Plan. Furthermore, the merger of economic results from our domestic economy and from foreign trade increased the significance of profits.

The system of payments to the state budget remains unchanged, however; as of 1 January 1986 payment of depreciations of capital assets to the state budget will be introduced in most industrial and construction branches; it amounts to 40 percent of their creation. This payment of depreciations is based on the need to balance in the next 5-year plan the assets and the needs of the enterprise sphere, and to increase the share of products in the structure of resources designated for the financing of the needs of the VHJ's and enterprises. An important reason for the payment of this part of depreciations is higher than corresponds to actual obsolescence of capital assets. The standards of depreciation, according to which depreciations are calculated, are based on the double-shift use of capital assets, while the actual use of capital assets is more than one-third lower. It is therefore fully justified to redistribute a part of depreciations through the state budget.

Another factor which raises the demands of the financial management system in the Eighth 5-Year Plan is the application--or further consolidation--of the khozraschet character of practically every fund of the VHJ's and enterprises, which means in particular the introduction of the investment fund created mainly from the earnings retained by the VHJ's and enterprises according to norms, instead of the current two funds--the development fund and the construction fund--and furthermore, a change in the character of the creation and use of the R&D fund and the working capital, and adjustments in the creation and use of the contingency fund of the VHJ's. Practically all remaining funds of the VHJ's and enterprises are transferable semiannually.

Prudent Centralization

One of the most significant changes involves the measure aimed at higher efficiency of the financial management system on the VHJ and enterprise level. The financial management of the enterprises follows the generally valid regulations and the VHJ statute. Enterprises show profits, render accounts and use the profits they have created to finance their needs. They pay their profits to their superior VHJ according to a financial plan. It is not advisable to change these methods, or the responsibility of the enterprises for the funds to cover their needs, and thus, also their interest in the accumulation of financial resources would be diminished. The khozraschet and financial systems applicable within the VHJ's must proceed from these points of view.

Reviews of the implementation of the Set of Measures have demonstrated that certain negative traits appear in financial relations of the VHJ's and enterprises and weaken the interest of the enterprises in khozraschet. In a number of cases financial assets of enterprises have been excessively centralized on the level of the VHJ and then redistributed back to the enterprises, even when the enterprise had the right to make their decisions concerning, for instance, investments, R&D and inventories. In essence, this separates the financial management from the material management.

The financial management in the Eighth 5-Year Plan will be arranged in a differentiated way according to specific conditions of the VHJ's. The degree to which the financial management of the VHJ is centralized must correspond with the integration and centralization of the material management on the VHJ level. The superior central agency will assess the level of centralization and reflect it in the statute of the VHJ. Within the VHJ better financial results of the khozraschet of the enterprises unconditionally demands that the VHJ leave part of the earned profits to the enterprises to cover their planned needs, and that they adjust the extent of the creation and use of funds within the VHJ in accordance with realistic conditions for the centralization or decentralization of managing functions within the VHJ.

Investments and Inventories

Efficient replacement of capital assets and the development of inventories are still plagued by chronic shortcomings. Therefore, in the Eighth 5-Year Plan the financial management system enhances the khozraschet responsibility of the VHJ's and enterprises in these sectors as well. By means of the investment fund established according to a standard rule, the khozraschet linkage of assets and needs is reflected in the financing of all investments. Certain advantages are offered to the financing of large construction projects (above Kcs 20 million). In the same way, the method of creation of investment funds will be differentiated according to specific conditions of individual branches, and the objective in all key branches will be a fund established according to a standard rule from profits and depreciations of capital assets. Naturally, bank credits will be granted for investments, and in case of subsidized construction projects, the subsidies from the state budget will be granted to the investment fund according to valid principles based on the urgency of their application. A stipulation makes possible above-standard allotments to the investment fund (from higher profits and from the export incentive fund).

The new amendment of financial replacement of capital assets is characterized mainly by further preferential considerations in the financing of modernization programs during repairs of capital assets within certain stipulated frameworks. This form of support to modernization programs, tested and confirmed by many years of practice, has been recently further expanded; however, it must be based on a higher share of modernization and reconstruction programs in total investments financed from the investment fund to the detriment of new investment programs, especially construction projects.

Furthermore, the responsibility of the enterprises (VHJ's) for the development of inventories in the Eighth 5-Year Plan has been intensified. First of all, the tasks of the earnings retained by organizations in the financing of their inventories has been expanded. At the year's end organizations must cover their above-plan inventories with an allotment from the profits to their working capital, namely, in an amount equal to the share of their working capital in their inventories. Analogically, both in the plan and in reality inventories for which banks refused credit must be financed from profits.

Higher allotments to working capital in an organization may affect the opportunity to use the earnings as monetary incentives (in the cultural and social services fund and in the special compensation fund), to finance investments and R&D, and to set aside surplus in the contingency fund. It is therefore presumed that this measure will curtail the disproportional growth of stockpiles and instead, lead to their reduction. If the stockpiles are reduced below their planned amount, the organization can transfer part of its working capital and distribute the earnings for the financing of its needs (investments, R&D, contingency fund, and economic incentives).

Research and Development

The purpose of the amendments on R&D financing in the Eighth 5-Year Plan (applicable ahead of schedule already in 1985) is to help accelerate the entire R&D process, including the application of its achievements, and render it more effective. The khozraschet accountability on the part of the VHJ's and enterprises for the financing of R&D programs, their results and implementation in this area is transferred to a greater extent to the VHJ's and enterprises, so that financing depends mainly on those VHJ's and enterprises that will utilize the results of R&D. A major role is played here by R&D funds established in the VHJ's and enterprises in accordance with who will implement R&D achievements. R&D funds are derived from costs on the basis of long-term standards stipulating the conditions for operations and schedule for the R&D program within the authority of those who will implement R&D achievements. All remainders of such funds may be transferred without any restrictions from one year to another.

The resources for the R&D fund may be supplemented from the earnings of the organization according to its decision. Investments in the solution of tasks and under certain conditions, also investments caused by the introduction of new technology into production, may be financed from the R&D fund, naturally, provided that the organization has created adequate resources in the fund (for example, by more economical solutions of tasks, by sales of capital goods output to other organizations).

An essential part of the outlays for R&D will continue to be financed from the state budget. However, this kind of financing will be more restricted and linked to the fulfillment of the prescribed parameters and timetables.

The whole amendment puts special emphasis on economic contributions of R&D reflected in the financial plan and on their evaluation based on factor analyses of increments in profits. Continuous linkage of investments with resolved R&D tasks in the fulfillment of their outputs remains one of the key issues. The internally coordinated plan and the use of investment funds of the VHJ's and enterprises must contribute toward that end. Experimental reviews of the so called innovation fund, from which both non-investment and investment needs of the entire R&D cycle will be financed, are planned for the Eighth 5-Year Plan.

BANK ANALYSIS OF INVESTMENTS SHOWS PROBLEMS

Prague HOSPODARSKE NOVINY in Czech No 48, 1985 p 4

/Article by Eng Vaclav Krauz, State Bank of Czechoslovakia, Principal Institute for the CSR: "Results of Bank Analysis of Investments: Little Reason for Joy"/

/Text/ The principal institute for the CSR, the State Bank of Czechoslovakia, this year analyzed the utilization of capital assets and the drawing up of capital investment plans for 1986, this in order to evaluate the extent to which the suggestions of enterprises and of CSR Government departments correspond to the guidelines for the Eighth 5-Year Plan. This analysis showed that some partial positive tendencies are developing. For example, there is an increase in renovation and modernization construction as well as construction aimed at environmental protection. However, the overall evaluation does not show the necessary conversion to a more effective investment process.

In the Seventh 5-Year Plan, the extensive growth of capital assets continued while the dynamics of production were relatively lower, leading mainly to a further decline in the effectiveness of capital assets.

Effectiveness of Capital Assets in the CSR in 1984 (1980 = 100)

	Share of adjusted actual output in the average condition of machinery and equipment	Shift-work rate
Chemical industry	111.3	99.3
Wood processing industry	90.9	100.5
Construction materials industry	78.0	99.5
Food industry	95.1	99.9
Health services	102.3	99.5

Utilization of Existing Capacity

There has been a great decrease in the utilization of machinery and equipment, principally in the construction materials industry. On the other hand, the utilization of capital assets in the chemical industry, and to some extent in health services as well, has increased.

When evaluating the time utilization of capital assets, the situation is not much better. The traditional indicator is the shift-work rate coefficient, which gives the total number of days worked by workers in three shifts in comparison to the number of days worked in the first work shift. The development of the shift-work rate in individual fields shows that there has been some success in stopping the decline in the rate, but not in all fields. At present, the highest shift-work rate coefficient (for a given type of production) is in the chemical industry (1.393). In other fields it falls below the value of 1.3.

Furthermore, the average age of machinery and equipment in individual fields has generally increased. In all fields, there is an increase in the amount of machinery and equipment totally out of commission (currently 24.5 percent) and a decrease in the rate of liquidation of old machines (under 2 percent).

The above analysis shows that it is necessary to implement the aims of the guidelines of the Eighth 5-Year Plan, i.e., to emphasize that further growth in the production sphere must be accomplished at a lower demand for investment and with an increased utilization of existing capital assets. It is necessary to invest primarily in the renovation, reconstruction and modernization of capital assets and to increase the share of machines in the total volume of investment.

In this connection, we are preparing new regulations for the Eighth 5-Year Plan which are in harmony with the goal to strengthen credit lines and to impose sanctions based on the utilization of capital assets. In cases where there is insufficient utilization of capital assets, we will curtail demands for new credit and require early repayment of credit (including credit sanctions).

However, the underutilization of capital assets represents a broad problem which is closely connected with the overall system of managing and planning capital investment.

Building Construction Projects

In August of this year, the Czech Planning Commission, in cooperation with the Czech Commission for Scientific and Technology and the Development of Investment and Banking, checked the preparedness and effectiveness for major centralized construction proposed for starts during the 1986-1990 period. The aim of this check was to verify where buildings scheduled to be started in 1986 are properly planned. As it turned out, in principle for CSSR Government institution buildings, the preliminary projects had to be approved by 31 July 1985 and required 5 months to a year of initial construction.

The checking involved construction projects for 111 buildings, of which only 61.2 percent had met the conditions encompassed in the construction investment plans. The lowest degree of completion was found in the housing construction sector (40 percent).

In addition to this, the bank verified project readiness in all construction costing more than Kcs 10 million (planned starts in 1986). The results show that, in comparison to previous years, there are no positive changes in project readiness. Of the total of 308 construction projects, 75 percent have completed the project stage. Aside from housing construction, there is also below average performance in the areas of the Ministry of Industry, the Ministry of Health Services and the Ministry of Construction. In contrast to this is construction in, for example, the area of the Ministry of Agriculture and Nutrition (86 percent of the buildings).

The main reason for the delayed completion of projects lies in the preproject preparation, and is the result of unclear concepts of the investors. Not uncommonly, the project tasks are done over a number of times because of changes in the technical designs of the construction and changes in the supply system. The extremely varied conditions in project preparation show that these problems can be influenced by responsible work concepts on the part of enterprises, economic production units and ministerial departments.

Nonproduction Sphere

The domestic and external conditions of past and present economic growth limit the extent and the orientation of capital investment. Capital investment can continue to solve only the most pressing needs of the national economy. Among these, without doubt, are construction in the nonproduction sphere, particularly for environmental protection purposes. However, even in this area the need for effective capital investment must be met.

What knowledge have we gained from the preparations for the 1986 Plan and its status in September of this year?

The demands of key investors surpass the investment capacity, which is particularly true in the case of the national committees, the Ministry of Health Services, and industry. In practically all fields there are a few smaller constructions with budgets of up to Kcs 10 million, except in the agricultural field where approximately 35 percent of investments will be small in scale.

The proposals for investment actions for 1986 have left much more room for reconstruction and modernization than was the case under the Seventh 5-Year Plan. Reconstruction and modernization account for more than half of the 308 investment actions (53 percent). In most cases, however, just general renovation is planned; it is not a matter of so-called progressive modernization and a quick return action.

Of the 308 investment actions, 133 (or 43.2 percent) are in production construction. This figure is higher than under the Seventh 5-Year Plan, and it includes more construction focused on environmental protection.

* * *

In the 1986 plan proposal stage, the bank is taking a negative stand mainly in the case of those constructions which are insufficiently prepared in terms of projects and deliveries, or those that have a low effectiveness. In the area of the Ministry of Agriculture and Nutrition, it opposed, for example, the completion of the construction of a specialized plant for keeping milk cows in the Bitov cooperative (because of its low effectiveness), while in the area of the Ministry of Construction this involved the modernization of the sorting plant in Lulec. In some other cases, the bank refused credit for construction.

Therefore, with our participation, we are trying to exert a positive influence on the selection of constructions. However, the decisive role is played by the central authorities of investors. Good quality planning involves improving the preparation of investors and, above all, increasing concept preparation in the work of the investors.

OFFICIALS QUIZZED ON ASPECTS OF ECONOMY

Budapest OTLET in Hungarian No 51-52, 20 Dec 85 pp 8-11

[Round-robin interview with Zsigmond Jarai (department head at the State Development Bank), Rezso Nyers (scientific consultant to the Economic Sciences Institute of the Hungarian Academy of Sciences), Sandor Gaspar, chairman of the National Trade Union Council), Albert Racz (chairman of the State Offices of Wages and Labor Affairs), Jozsef Drecin (state secretary at the Ministry of Culture and Education), Albert Kreszan (director of the Public Buildings Construction Enterprise), Imre Szabo (state secretary at the Ministry of Industry), Antal Zibar (director of the Wool and Textile Raw Materials Trading Enterprise), Ferenc Petrik (deputy minister of justice) and Miklos Pulai (deputy chairman of the National Planning Office); date and place not given; first paragraph is OTLET introduction]

[Text] I ask a question of someone, and then he gets to ask a question of someone else, and so on. Once the process has been started, the reporter acts merely as a messenger. Questions and answers, and then more questions and answers. There is only one rule: the questions must concern the economy, in accordance with our field of specialization. This round-robin could go on endlessly. Regardless of its field of specialization, however, our journal is not made of rubber. Therefore we request our readers to be satisfied with 10 questions and as many answers in this issue. We will continue the round-robin next year when Miklos Pulai, as the last interviewee in this issue, will have the right to ask the first question.

OTLET's question of Zsigmond Jarai, department head of the State Development Bank: Do bonds make for a better world?

Zsigmond Jarai: Yes, they do. In two respects. First, the enterprises have an opportunity to raise cash, which is no small thing today when money is scarce. They do not have to wait for a solution from above, from heaven. And it is no more trouble for an enterprise to float a bond than, say, to apply for and obtain a loan. Indirectly, then, bonds help to broaden the enterprises' autonomy. The second effect is of the same nature, but from the viewpoint of the citizen rather than of the enterprise. By buying a bond, a person casts a vote of confidence in a business. This presupposes that he first seeks information, weighs it, and then decides to take a risk, to become an entrepreneur. This makes for sound business sense, which is what is required in the case of small businesses as well. And something else. The bondholder, especially in the case of bonds bearing interest at a variable rate, exercises a kind of social control over the enterprise. Incidentally, the public so far has bought about two billion forints' worth of bonds. This also indicates that personal savings are on the rise. Considering all this jointly, I may safely say that Yes, bonds do make for a better world in Hungary.

[Question] My question of Rezso Nyers is as follows: Is this how he imagined the 1968 economic reform?

Rezso Nyers, scientific consultant of the Economic Sciences Institute of the Hungarian Academy of Sciences: This way in many respects, but differently in some others. I thought that the direction and essence of the implemented changes would be like this or similar, but I did expect smoother progress. I hoped that the reform process would not grind to a halt, and that we would go farther by the mid-1980's than we have. Our present problems can hardly be attributed to necessity beyond our control. In retrospect they support the view that the future in its concreteness does not lend itself to planning, and only the trends can be foreseen over a long horizon. Regarding many of the specifics, the song is right which claims: "You cannot guess the future."

Of our 1968 expectations, I regard the following as realized or in the process of being realized:

--National economic and enterprise planning has undergone favorable changes. There is less red tape in planning, and yet we have a more effective tool with which to democratically influence the social processes.

--The consumer market has changed in the population's favor. Essentially it is no longer a sellers' market, although the vigorous expansion of supply has been arrested in the 1980's, and there are temporary shortages of certain items.

--Development of the agricultural sphere and the incentives for it have basically proven suitable. Under the existing economic mechanism, the spheres of energy, transportation, and services are able to fulfill well--sometimes even under unfavorable financial conditions--their function of providing the basis for macroeconomic capital replacement.

--Institutionalization of a multisectoral economy has been favorable in that supply is improving, and also material resources (labor, capital and human capital) are participating more fully in the process of capital replacement.

--The population's economic thinking has developed and become more intensive. Economic information is more frank and provides more knowledge. Thus the human factors of economic democracy are much better ensured now than previously.

And were I to list what I imagined differently 18 years ago, I would include the following:

--Neither the economic mechanism nor the so-called "economic environment" has reached the critical level of development in which it stimulates entrepreneurship at the enterprises to the extent now required (the requirements today are far more rigorous than they were in 1968). For although the enterprises' scope of action is wide by law, in practice state regulation limits it excessively.

--Manufacturing industry's export denominated in hard currency is expanding only slowly in the 1980's, in conjunction with the slow changes in the production structure, and with the uneven and overall unsatisfactory progress of technical development.

--Too much of our production is of low efficiency, there is barely any disinvestment in the economy, and little capital is freed for new ventures. This perpetuates the danger that the enterprises whose efficiency is low will "eat up," in the form of various subsidies, the profits of the efficient enterprises.

--In 1968, I hoped that we would be able to clarify within a relatively short time the situation regarding the socialist scale of values for the intensive period, and to bind it with strong links to the process of economic reform. However, this hope has been realized only partially; and it is not an exaggeration to say that we are urging intensive development, while thinking is still dominated partially by the extensive period's scale of values.

My opinion may be summed up as follows: It would be useless to lament that things have not turned out entirely the way we expected and would have liked them to turn out. What we must strive for is to change our lot for the better as soon as possible, by solving our present problems.

[Question] My question addressed to Sandor Gaspar is as follows: Can the considerable creative force generated in the enterprise workers' business partnerships be utilized in the trade-union movement, or should such partnerships be regarded as a method foreign to the movement?

Sandor Gaspar, chairman of the National Trade Union Council: Enterprise workers' business partnerships are not a method foreign to the trade-union movement. Were this method foreign, we would not have introduced it. The trade union clearly understands and recognizes the usefullness of enterprise workers' business partnerships. There is a real need for them, they are filling a gap, and hence are producing value. This justifies their existence. There is of course silt also here, forms that do not serve the intended purpose, just as in the case of anything new. In some places these partnerships serve merely to supplement the workers' pay. But since the partnerships perform their work at the plant, the factory collective oversees their operations as well. The task now is to eliminate the perfunctory elements and strengthen the useful activity. The performances of the enterprise workers' business partnerships simultaneously call attention to the shortcomings in production engineering and industrial engineering. It would be desirable to utilize also this experience in the activity of the enterprises.

[Question] My question is addressed to Albert Racz, chairman of the ABMH [State Office of Wages and Labor Affairs], and reads as follows: Are statistics more accurate than the present ones being compiled on the labor force? Would it be possible to manage manpower more efficiently, and is there any plan to do so?

Albert Racz, chairman of the State Office of Wages and Labor Affairs: Labor statistics in Hungary is proceeding at present in two directions. In my opinion, the overall accuracy of the statistics on the number of persons gainfully employed, their structure, and the changes in them, is satisfactory. On the other hand, however, the pictures we obtain of the occupational and territorial structures are admittedly inaccurate. The other direction in labor statistics investigates the relationship between manpower demand and supply. This is the third year that we are compiling such statistics in Hungary. We have monthly reports from 109 cities and districts. From these data we see the trends rather clearly. Employers at present are seeking help to fill 60,000 vacancies nationwide, and there are approximately 4,000 to 5,000 persons unable to find employment. We have at present five or six cities in each of which a significant number of persons (over 100) are experiencing difficulties in finding employment. So far as the second part of your question is concerned, manpower could be managed more efficiently. Increased effort in this direction has been noticeable during the past two years at the level of macroeconomic management. Businesses, too, are showing signs of such effort, but of course only within the limits of the possibilities that the system of regulation permits. Further efforts will require also more aid from central resources. To alleviate, for example, the problem of unemployment in the lagging districts.

[Question] I would like to know from Jozsef Drecin, state secretary at the Ministry of Culture and Education, his views on the question of labor discipline and labor morale in education.

Jozsef Drecin, state secretary at the Ministry of Culture and Education: I see no difference between education and the entire country.

[Question] My question is addressed to Albert Kreszan, director of the Public Buildings Construction Enterprise, and reads as follows: When will we live to see that the roofs over our heads are not leaking?

Albert Kreszan, director of the Public Buildings Construction Enterprise: I believe that Comrade Drecin has in mind primarily leaks in buildings with flat roofs. When there are leaks in roofs of the other main type (gable of hipped roofs, covered with slate of burnt clay tiles), they can be repaired more simply and at substantially smaller cost that the leaks in flat roofs.

In response to your question, I am able to say definitely that our enterprise delivers each flat roof in waterproof condition. For we hold a so-called flooding test when the roof is in place and sealed, and we offer the customer for acceptance only a roof that is free of defects.

On average we deliver 25 buildings a year to our customers. And, in spite of what I have just said, we get about five warranty claims because of leaking roofs. What is the explanation of this contradiction? Let us start out from the criteria of a good roof: good design, good workmanship, and constant maintenance to protect the waterproofing and prevent damage. If any one of these criteria is not fulfilled 100 percent, the roof will leak. The fact remains that, in about half of the aforementioned five warranty claims a year due to leaking roofs, the leaks are caused by the architect's failure to properly design the junctions or seams, and by concealed defects resulting from poor workmanship. In the other half of the warranty claims, however, the leaks can be attributed to improper use (the building's owner uses the roof for various operations, or he lets his workers walk on a roof that is not designed for walking), and to the complete absence of maintenance.

Our objective is to completely eliminate by the end of the 7th Five-Year Plan the roof leaks due to faulty design and poor workmanship. But we have no control over roof leaks caused by faulty maintenance.

Incidentally, this problem is a worldwide one. During my study tours in the FRG, Austria and Finnland, I was told that they, too, have problems with leaks in flat roofs, for the same reasons as in Hungary. This of course offers us no consolation, or perhaps only the consolation that we meet the "world level" also in this respect.

[Question] My question is addressed to Imre Szabo, state secretary at the Ministry of Industry and reads as follows: The construction industry is being forced to compete but is unable to do so with its long completion dates, because industry is able to supply special-purpose materials (pumps, fans, electric water heaters) only with a lead time of 1.5 years. When will industry make real competition in the construction industry possible?

Imre Szabo, state secretary at the Ministry of Industry: The construction industry does indeed build a substantial volume of industrial goods and semifinished products into apartment buildings and other structures, which occasionally may be specifically industrial buildings. Therefore it is in the ministry's interest to supply the demand as fully as possible. However, the ministry does not and cannot produce everything.

In the interest of keeping pace with the rapid changes in the proportions of public and cooperative housing construction, the Ministry of Industry and the Ministry of Construction and Urban Development are holding regular consultations to coordinate the construction industry's requirements with the industrial enterprises' capacities and willingness to produce. We are adopting production-organizing measures, respectively offering incentives, to alleviate or eliminate the shortages.

In the question addressed to me, the director of a construction-industry enterprise lists several products for the building industry as shortage items:

--The supply of electric water heaters has not been always adequate. In the course of reconciling the market allocations for 1986, the EVM [Ministry of Construction and Urban Development] estimated its requirement at 8,000 electric water heaters, but enterprise plans call for producing only 7,000 units. The EVM has adopted measures to resolve this shortage.

--Shortages of pumps and fans have not been reported by the enterprises, nor at the level of the EVM.

--In addition to the items listed in the question, also other products are in short supply. Such as radiators, electric ranges and pipe fittings, for example. We are initiating new investments to expand production capacity.

--There are also products (such as wire for gas-shielded welding, and steel pipe, for example) whose demand can be supplied only through supplementary import, because their domestic production is inadequate.

In addition to the efforts of industry, I believe that stockpiling trade will have to assume a greater role in the future in ensuring the construction industry's supply. Because production is continual, whereas construction is a seasonal activity.

[Question] My question is addressed to Antal Zibar, director of the Wool and Textile Raw Materials Trading Enterprise, and reads as follows: The dynamic growth of sheep farming and wool production came to a halt in 1983. Indeed, the sheep population has declined sharply since then, and consequently so has the quantity of wool produced. How do you regard the prospects of sheep farming and wool production? Will it be possible to turn around the decline evident in the supply of this important domestic basic material?

Antal Zibar, director of the Wool and Textile Raw Materials Trading Enterprise: The cost level of sheep farming exceeds the combined total proceeds from the sale of all its products. Thus this branch of livestock production has become unprofitable. Some of the farms are attempting to limit the loss by reducing the size of their herds. The farms neglected to cull and replace many of their old ewes whose wool yield is low. All the offspring are being sold for slaughter. And a period of development more than a decade long has ended!

Comprehensive measures are needed once again to restore the willingness to engage in sheep farming. To the best of its ability, the state budget will have to aid sheep farming. In my opinion, however, also the sheep farms will have to uncover their reserves, which are not so deeply hidden anyhow. It will perhaps suffice to mention the most important reserves: the average lambing ratio is low; the wool yield is small, and its composition by grades is worse than what would be possible, etc.

I am convinced that, if comprehensive measures are adopted soon, Hungarian sheep farming and wool prodction will weather their present difficult phase and will aid the realization of our national economic objectives with results more significant than up to now. The Wool and Textile Raw Materials Trading Enterprise will do everything in its power to aid these efforts.

[Question] I would like to ask Deputy Justice Minister Ferenc Petrik the following question: When will the gaps in the statutory regulation of the enterprise councils' operation be filled?

Ferenc Petrik, deputy minister of justice: I would like to turn around and ask: Are there any gaps? But I realize that such a question would be out of order. All I can say, therefore, is this: Believe me, not every alleged gap in statutory regulation is really a gap. It is not a gap when the statute sets only the limits of enterprise behavior, and within these limits--in this gap, if you wish--the enterprise is free to do what it wants. Regulation is likewise not incomplete when a provision does not take over from the addressee of the statute the right and responsibility to decide some question. It would be very peculiar if, under self-management, the statute were to provide a prescription for every imaginable question, instead of letting the enterprise itself provide the answers.

Some people have objected, for example, that the statute does not specify who is to elaborate and present to the enterprise council the matters that fall within its authority. True, there is indeed no such provision. But would it help the enterprise's operation if the statute were to state that every matter should be elaborated and presented by the person who is the most familiar with the given matter at the enterprise? And does this "gap in statutory regulation" really create a problem?

Of course, the statute is not flawless. We, too, have accumulated several issues that will require amending the provisions. Merely as an example: Why can't a business organization whose enterprise council is the general manager, elect also a control committee? Or another example: The statute specifies that two-thirds of the workers entitled to vote must be present to elect their representatives to the enterprise council. But how are the workers to exercise this right at an enterprise where the peculiarities of its operation make it difficult to hold a meeting for the election of delegates at one place and at the same time (in retail trade, catering or the hotel industry, for example)? Neither do we regard as adequate the legal protection of the enterprise council's chairman. Namely, experience indicates that in most cases the enterprise council elects its chairman from among the council members whom the enterprise's director nominates. Thus the enterprise director has the right to revoke the nomination, vacating the chairman's seat on the council and thereby automatically preventing him from acting as the council's chairman.

These and the other collected questions will not require immediate action, and we would like to avoid frequent modifications of the statute. But once we have gained sufficient and substantiated experience, we will not hesitate to propose changes in the statute.

[Question] I would be interested in Miklos Pulai's answer to the following question: What gives the enterprises more autonomy: their organizational independence, or economic regulators that do not limit the enterprises' room for maneuvering and their decision-making authority? And finally, is it possible to command-direct with the economic regulators?

Miklos Pulai, deputy chairman of the National Planning Office: Although this question is similar to the one about the chicken or the egg being first, it is not so difficult after all.

Organizational independence is a prerequisite for an enterprise to be independent within the room for maneuvering that has evolved (and in part has been developed) for it. The room for maneuvering and its expansion depend on many factors that the regulators influence only partially. This is borne out by the experience that there are significant differences, in terms of enterprise results (and hence of the room for maneuvering as well), among enterprises operating under the same system of economic regulation.

With the economic regulators we want to influence the enterprises' decisions, and not to command-direct them. Of course, the system of economic regulation is a broad concept that usually is interpreted to include many elements (perhaps too many). The nature of these elements differs considerably from the viewpoint of exerting influence.

Let us consider a few recent examples: In 1986, the enterprise is taxed at a rate of 500 percent if its average wage increase exceeds 10 percent. Thus raises higher than 10 percent are not banned, only too expensive. This obviously influences the enterprises' decisions regarding raises. Of course, not of the ones that have found it difficult even up to now to give raises of only 3 or 4 percent. Or anothe example: As a rule, enterprises must pay a 15-percent accumulation tax on their investments. A few preferential investment objectives may be given preferential tax treatment. I hope that this is influencing the enterprises when they are formulating their development concepts.

PROBLEMS, SHORTCOMINGS IN RAIL TRANSPORTATION DISCUSSED

Budapest FIGYELO in Hungarian No 1, 2 Jan 86 p 5

[Interview with Dr Rezso Bajusz, director general of MAV [Hungarian State Railways] by Maria Demcsak: "Is MAV on Track?"]

[Text] What could be the reason that one of the country's largest enterprises, the Hungarian State Railways, in recent years has not been able to completely fulfill either the quality or the quantity requirements? Can movement away from this low point be expected in the future? This is what our reporter discussed with Dr Rezso Bajusz, MAV director general.

[Question] This year in the fall MAV had even bigger problems than usual. It can certainly be evaluated now to what extent the railroad has been able to fulfill the requirements.

[Answer] The real processes taking place this year in the national economy have made the railroad's job significantly more difficult. It is well known that the energy restrictions caused by this winter have caused significant problems in the chain of production, distribution and consumption. In the first 5 months we fell short of our plan by about 3.5 million tons, which was due to temporary economic difficulties, and similar problems in the surrounding countries also played a significant role. Consequently, our transit also declined, which we were unable to sufficiently offset even with the various discounts.

[Question] This quantity, when compared to the 120 million tons planned for the whole year, is minuscule. Theoretically it is not unimaginable, that this shortfall can be made up.

[Answer] Even before the fall traffic we could see that we could only partially cover this shortfall. By the end of August we had "repaid" half a million tons. At the same time, due to the lack of merchandise base, the shortfall had increased by three-quarter million tons, which was connected with the late harvests. By then it had become clear, that the problems can only be overcome by special measures, and even then only in part.

[Question] Do you mean measures beyond the railroad's sphere of authority?

[Answer] Yes. On the initiative of the Ministry of Transportation and the National Planning Office a national program of measures has been prepared, which covers the shippers and the domestic supply industry as well. The railroad has tried to relieve the tensions somewhat by means of an internal program of measures. A significant portion of the programs has been completed--with the exception of the spare parts and locomotive deliveries, the omission of which has affected us very severely. In spite of this we were only able to approximate the quantity planned for the last 3 months.

[Question] So you were unable to make up the total of about 4 million tons of shortfall.

[Answer] Only a part of it, about half a million tons. Even more of it could have been made up, but we were losing additional positions in November as well as in December. In the first week of November the shippers were loading at an unusually low level because of the holidays. And in December, even though we had the capacity to transport 10-11 million tons of goods, this projection was far from being met, because at an overwhelming majority of the enterprises the working days between the two holidays had already been worked in advance. Furthermore, lack of planning and problems in receiving have cropped up within the railroad system. Fatigue and indifference could also be observed among the railroad workers, resulting in lack of discipline.

[Question] The outside observer sees only that the railroad is unable to live up to the justified demands of the national economy....

[Answer] If we analyze the situation which has developed in detail, it is clear to the experts that some of the problems can be solved by better organization, creation of interests and a series of other measures--by finding the undiscovered opportunities for relative expansion of the capacity. But only some of them.

[Question] The root of the problem--as much has already been said about this--is to be sought in development which for years has been unnecessarily smaller.

[Answer] This is a fact, but we hope that we are at the end of such a macroeconomic cutting-back process which demanded unheard-of efforts from the national economy. We succeeded in decreasing the deficit in the balance of payments. Of course, the national economy's problems have also affected us. But we did not consider it natural that they affected us more than many other producing organizations.

[Question] Would you explain more in detail what you mean?

[Answer] The railroad operates with a huge equipment park, with low specific investment in relation to tne wealth it owns but with large volume considering its quantity. It is obvious that when the national economy has problems much more development resources can be temporarily taken away from the large producing organizations. It made our situation even more difficult that we arrived at this 5-year plan period with significant amounts of indebtedness.

[Question] How much was the railroad's total contribution to the budget in the last 5 years?

[Answer] In the Fifth 5-Year Plan the difference of receipts from and payments to the state was a surplus of 17 billion forints. And during this 5-year plan period we paid in about 8 billion forints more. Our interpretation of this is that the Hungarian Railroad as an organic part of the economy has made a significant contribution to decreasing the tensions. It is a different question that the railroad's activity--in contrast with a series of other producing organizations--cannot be replaced by import.

[Question] Current serious problems of the national economy have significantly affected the railroad as the last link in the chain of realizing production. This might even come in handy for MAV, since it has become clear that it cannot be left to its own devices as an independently operating enterprise.

[Answer] We would have preferred for this not to happen. As early as 1984 the government recognized the railroad's problems and developed a concept for solving them, but since then the situation has only worsened. The government's resolution last April took a very clear position in favor of halting the negative tendencies seen at the railroad during the Seventh 5-Year Plan. I consider this to be a great achievement. But today the national economy is not in the position of giving us additional billions to quickly make up the shortcomings.

[Question] Knowing the present situation, the only question is: When will the possibility present itself to help the railroads more vigorously?

[Answer] During the Seventh 5-Year Plan--even though not to the extent that the role we fulfill in the national economy would call for--we have received certain preferences within transportation. There is a clear resolution to gradually eliminate the railroad equipment problems while improving the efficiency or national economy.

[Question] What additional steps is MAV planning in the coming years?

[Answer] The Seventh 5-Year Plan goals are known. We would like to stabilize our economic operation partly by increasing the efficiency of the work within, and partly with the government help. It is the responsibility of the railroad management to distribute the financial means--about 33 billion forints--expected to be available for the development of the plan, according to such an extremely well considered strategy the fundamental goal of which is to preserve the existing transportation capacity, to maintain and in some areas to raise the level of service.

[Question] What are the points of emphasis you will concentrate on to meet this goal?

[Answer] Priority will be given to network development and within this to the development of the mainline network, knowing in advance that because of this for 5 years we will hear many complaints about the secondary network. The other significant task is to develop the rolling stock. We must maintain the level of the rolling stock transport capacity partly by intensive maintenance and partly by purchasing new equipment. Today it is still questionable to what extent we can rely on the domestic industry or the industry of the socialist countries for supply of materials, spare parts and equipment. In order to fully implement our plan we will absolutely need top level help on this point.

[Question] You can achieve a problem-free relationship with industry only with the state's help?

[Answer] The regulated market mechanism does not automatically solve our equipment supply problems even though we have the money for it. It is no accident that those points of the plan of measures worked out by the government were implemented to the least extent which concern spare parts supply and industrial support. It is my opinion that supply priority designated by the government is one of the conditions for being able to carry over our transportation capacity to the Eighth 5-Year Plan.

[Question] Return to the steam locomotives is an impassable path. But this fall you were forced to do just that due to the lack of spare parts for the electric locomotives.

[Answer] This is a fact. We increased the pulling capacity of the steam locomotives and besides this we leased diesel locomotives from the Czechoslovak partner. This is why energy consumption increased, causing a quarter billion forint loss of profit.

[Question] MAV would need vigorous technical development if for no other reason then because its employment problems are increasingly untolerable.

[Answer] The concentration of developmental means just mentioned also indicates that in part we wish to replace manpower in the area mentioned. I do not speak of freeing up manpower because the technical developments are being carried out mainly in areas with manpower shortages. The most important viewpoint of the developments is to make relative capacities available. By speeding up the train traffic and the switching operations we plan to increase the transportation capacity by 5-7 percent.

[Question] Half a year ago the Hungarian state took out a $20-million loan from the World Bank for MAV. What is this money being spent on?

[Answer] With the World Bank loan we can purchase the most modern technology. We will implement a portion of the containerization development, significant machinery purchases for track modernization and track maintenance, as well as modernization of the Ferencvaros railroad station from this loan. In the near future the railroad will also obtain modern technology as payment for the export of its own specific services. We plan to enter into joint ventures with foreign firms, and we also have agreements with domestic industry. For the most part these represent joint developments to speed up the handling of traffic, to decrease specific energy consumption, and a number of other goals. But in the first half of the plan period too much significance must not yet be attributed to the items listed, since these will be supplementary solutions.

[Question] Is passenger transportation also among the areas to be developed?

[Answer] Congressional and state resolutions obligate us to treat improvement of the quality of the passenger transportation services as a basic task. We can promise demonstrable progress in raising the standards of the passenger areas and facilities connected with serving the passengers, inside and outside cleaning of the trains, timely performance, and more flexible schedule design. We wish to do everything to at least keep and to win back a part of our traveling public we lost due to the fare increases. Basically we place the emphasis on the so-called job-related trips, that is, on the commuters. To achieve this we intend to buy 60 electric motor trains, but there is also a need to change the attitude of our workers.

[Question] This also requires wage improvements.

[Answer] We will be able to make progress here as well, again with the help of the government. So far this year we have implemented a special wage improvement, I might say at the last moment. In fact, employment was alarmingly decreasing and in some places even maintaining traffic was in danger. For the first time in 10 years the decrease of employment stopped, but in order to keep the personnel in the coming years we will need central assistance in addition to the internal measures. Furthermore, we are already working on reorganizing the entire internal system. For example, we are introducing in broader circles the performance and piece rates. These measures will truly achieve the desired effect only if we also provide the workers with the conditions necessary for more efficient work.

[Question] The railroad's share of the performance of transporting goods is decreasing from year to year. Can continuation of this tendency be expected?

[Answer] As motorization becomes more popular, the public highway continues to gain prominence--even if not at the same rate as before--but the railroad continues to be the classical means for transporting large masses over long distances over land. If we cannot satisfy the needs of the shippers or cannot do it adequately, then they are forced to transfer their goods onto the public roads, even though they could be transported more cheaply and more efficiently by rail. But this is contrary to the interests of the railroad as well as of the national economy.

[Question] It seems that the plan for decreasing the need for transportation at the national economic level is contrary to the interests of the transportation enterprises since these can increase their incomes by increasing their transport performances. How can MAV reconcile the two?

[Answer] There really is a contradiction here between the interests of the national economy and the enterprises, but if we resolve this contradiction properly, then the enterprise interests can also prevail. The railroad is an enterprise of public service character but after all it also operates on the profit interest motive. Each ton it cannot transport decreases its income. But in the optimum case--in connection with the need for specific transportation--a transportation chain develops where in accordance with the regulating principles of the transportation policy and on the basis of the technical and economic possibilities the goods will come into existence, where they can be transported the most efficiently. If these transportation chains become completed--considering also the modern unit packaging, containerized and other technologies--then it is in the railroad's interest that these chains do come into existence and the specific transportation demands decrease on the national economic scale. The railroad's place is a stable one in the transportation chain and it can be organized, since we will shape the railroad's technical preparedness in accordance with this. We will also create the financial and technical conditions needed for the program. But the government program encourages not only us but also the public highway transporters and shippers to implement the program.

[Question] As far as I know central resources are also available to implement this program.

[Answer] Yes. Consequently I am certain that the goods appearing on the public highways due to duress caused by the capacity and other problems mentioned above can be guided back onto the railroad. If in the future the railroad did not prove to be a sufficiently reliable partner, then the program would cause the railroad to lose its position again. This must and can be avoided.

In conclusion let me say that I am optimistic because we have a strategy with which we can move away from this low point. We have also received a promise from the government for special aid. Naturally they are justified in expecting us to make the maximum efforts to take care of the tasks. Perhaps in the beginning the speed of progress will be slower than we would like, but we will be moving forward.

CREDIT,MONETARY TRENDS IN 1985 DISCUSSED

Belgrade PRIVREDNI PREGLED in Serbo-Croatian 24 Jan 86 p 6

[Article: "Most of the Newly Created Money Went to the Population"]

[Text] If one assumes that the social product was deflated by approximately 80 percent in 1985, in October the money supply lagged by approximately 40 percent behind the growth in the volume of the total production of the money supply and behind the growth in the volume of total production. That is to say, the annual rate of growth of the money supply at the beginning of November was 42 percent and it was 347 billion dinars greater than at the beginning of the year. In view of the fact that the entire production was based on constantly growing prices, this means, on the one hand, that the coefficient of the circulation of the money supply has been increased and, on the other, that some of the current payments were not met. In other words, this means that purchases were made by means of various securities which postponed payment, or else by a failure to make payments that were due. It is not possible to single out and state with certainty which aspect pertains to the faster circulation of the money supply and which to the irregular forms of money, but it is certain that the sum totals several hundred billion dinars, which indicates that the credit and monetary policy is considerably less restrictive than one would be led to believe by the indicators pertaining to changes in basic money supplies.

In the first 11 months of 1985, short-term bank credits (the data pertain to the period ending on 10 November) increased by 49 percent in relation to the volume at the end of the previous year, while long-term credits grew at half that rate (27 percent). A great increase was also noted in discounted and rediscounted stocks (approximately 67 percent) in comparison with December 1984. The volume of those stocks increased, however, also because they include the amount of interest earned by them. In the second half of November there was an unusually strong growth of bank investments, which caused the money supply to post a very high increase in that month. In November, it grew by 138 billion dinars, which was 40 percent of the money that had been created in the entire preceding 10-month period. Thanks to this, the cumulative growth of the money supply during the period January-November 1985 amounted to 470.6 billion dinars.

Most of the newly created money went to the population. In November, the population received 80.6 billion dinars, or 58 percent of the entire money supply. In 11 months, the population increased its liquid assets by 202 billion dinars, while in that same period the economy decreased its liquid assets by 40.5 billion dinars. This was the first time that the economic organizations had at their disposal at the end of November of the current year less money than they did in December of the previous year.

The outflow of the money supply into the hands of the population was caused, for the most part, by the rapid growth of personal incomes in November and in the preceding months, which contributed to having the organizations of associated labor convert part of their profits into money and distribute it by means of personal incomes. In view of the fact that, due to seasonal reasons, there is always a major increase in ready cash during December, it is to be expected that a significant portion of the money supply will be retained in 1986, mostly by the population but also by some other non-economic sectors.

The announced decrease in interest rates, to start in February 1986, could coincide with the increase in inflation which should follow the planned price increases and the growing costs of doing business. If one proceeds from the justified assumption that the growth of personal incomes will not continue at the present rate, one should expect that the rate of savings will go down. Furthermore, the decrease in interest rates will slow down, or even stop altogether, the process of increasing term deposits, so that the relative effect on demand will be more pronounced than would otherwise be the case.

The decrease in interest rates will contribute to the improvement of the financial situation in the economy, in view of the fact that it has to increase reserves and revolving funds as a whole. Data on the nine-month periodic accountings reveal very strained relations in this area. Eighty-eight percent of the total amount of revolving funds are invested in reserves and claims, i.e., in such a way that they take the longest possible time to revolve and it is most difficult to exchange them for more liquid forms of money. In financing the renewal of the means of production, in the majority of cases use is made of somebody else's funds; for this reason, self-financing in the economy has dropped from 43 percent in 1984 to 41 percent in 1985.

The percentage of ready cash in overall revolving funds has dropped to 12 percent (as opposed to 16 percent in the period January-September 1984).

The greatest problem in the structure of revolving funds are the reserves, which at the end of September accounted for approximately 53 percent of the revolving funds. In relation to last year, the reserves have increased by 87 percent, which is higher than the inflation rate. In addition to the high increase in prices, other things contributed to the increase in reserves: increased value of the reserves, a decrease in the overall market demand, an intentional withholding of products from the market because higher prices are expected, the hoarding of semimanufactures due to a fear of uncertain supplies, etc. Reserves have reached a level where on the average they spend two months in one cycle of production; during that period, well over half the amount in revolving funds is immobilized, which in turn causes an increase in shortterm debts and expenses associated with interest rates.

The Structure of Revolving Funds

Item	30 Sep 1984	30 Sep 1985
Revolving Funds	100.0	100.0
Money and securities	15.6	12.2
Buyers' debts	22.9	24.0
Debts from advances	11.8	11.1
Total reserves	49.7	52.7
Sources of Business Funds	100.0	100.0
Permanent sources of business funds	43.0	41.3
Associated resources	6.7	6.6
Total credits	32.7	34.5
Debts to suppliers	10.4	10.3
Debts for advances	7.2	7.3

In the absence of its own funds, the economy has been using the savings of others through bank credits. For this reason, bank credits went from 33 percent of all sources of business funds at the end of September 1984 to 35 percent at the end of September of this year. At the same time, this was also the cause of the increase in payments associated with interest rates, which is one of the major cause of spending inflation in Yugoslavia.

It is significant that thus far in 1985 there has been a high increase in advance payments (66 percent). Approximately 41 percent of all the debts in the economy are paid in this manner, and, judging from everything, it is unlikely that major changes will take place within 1985.

HEAD OF CROATIAN BANK DISCUSSES NEW BANKING LAW

Zagreb DANAS in Serbo-Croatian 24 Dec 85 pp 13-15

[Interview with Dr Tomislav Badovinac, chairman of the Business Committee of the Associated Bank of Croatia by Ljubomir Cucic: "A Fine Sieve of Economic Criteria"; date and place not specified]

[Text] The law on changes in the banking and credit systems is the foundation from which should stem a turnabout in money management in Yugoslavia. This turnabout should bring us not only closer to rational management of social financial resources, but also to a more complete influence by the organizations of associated labor, the founders of the banks, on the banks' management of money. We have discussed the changes that will inevitably follow the adoption of the law, and the reasons that have brought about the law with Dr Tomislav Badovinac, chairman of the Business Committee of the Associated Bank of Croatia which, incidentally, is the bank with the largest resources in Yugoslavia.

[Question] The law on the banks has been adopted by the federal assembly. Why was it really adopted?

[Answer] Our development to date has been marked by the fact that the demand for financial resources has been greater than the supply, except perhaps for the most recent period, when the demand may have fallen off because of high interest rates. This imbalance has been especially evident in regard to investment funds. Under those circumstances, the money was for the most part being allocated within certain banks, and so a partial mechanism for utilizing those funds became characteristic of our financial system. We lack those desirable integrating currents that guarantee an even influence of economic criteria and an efficient utilization of money within the framework of the banking system and the economy as a whole. The decision making in the banks is based on separate and consequently not uniform evaluations of the economic criteria pertaining to the conduct of business. The managements of many banks adjusted these criteria to the stipulations of a closed circle of their customers, bank members.

This so-called customer relationship had a powerful influence and, over time, it became a significant and financially perceptible aspect of the banks' conservatism. This was especially evident in the well-known principle that a bank would not only approve credit for, but would not even accept requests from organizations that were members of some other bank. The status of customer or depositor, i.e. one who deposits into a bank part or all of his money, is so powerful that by itself it guarantees that requests for credit will be honored. Thus, the customer's relationship with the bank renders marginal all criteria based on objective economic laws pertaining to the utilization of money.

[Question] The new law proceeds from the assumption that a bank is an independent economic institution. During the preparations for the adoption of the law, and during the public debate, several different interpretations of this assumption were voiced, and the question was even raised whether that assumption was of a non-self-management nature. Can it be concluded that the so-called independent bank is not equally welcome everywhere? It is evident that these contradictions and differences are not only of an economic nature, but are also political and even ideological.

[Answer] The law defines a bank as "an independent financial institution for conducting credit and other banking functions." It is true that this position has been interpreted in different ways. Still, the fundamental intent behind that formulation was simply to obligate the banks to apply economic laws in the conduct of their business. This presupposes greater independence, but also increased responsibility in the management of money. Independence really means that the members of a bank formulate their own and the bank's business policies exclusively in accordance with economic laws, make independent decisions on how to deploy the funds that have been deposited in the bank and, what is particularly important, accept all the consequences of poor business practices, the risks, erroneous decisions, and business failures.

[Question] Logically, this stands, but practice could bring about new disagreements. It is being maintained that such an elevation of banks is in reality the first step toward so-called "independent centers of financial power."

[Answer] I think that such views are without foundation. An independent center of financial power comes about when the accumulated funds in a bank are managed not by the founders but by some other forces, for example select technocratic groups, political factors, or a third party. We have been witnessing for many years these very practices, which had nothing in common with rational economic investments. As a matter of fact, that is the source of all of our troubles. Such interference, however, is not possible if, as provided by the new law, the management of the bank's resources is turned over to its founders, i.e. those who are forced to invest only in accordance with economic criteria. If they fail to do so, they must suffer all the consequences.

[Question] Such a responsibility also imposes the need for standardized criteria for lending, to state it tentatively. That is to say, it would be possible for many to satisfy the so-called economic criteria, but still lack sufficient funds because of scant resources. What should really be the main determinant in investing?

[Answer] It is not true that the banks have no responsibility toward the strategic goals of socio-economic development. On the contrary, it would really be good if the medium-term plans would base these strategic goals on the criteria of economic laws; as far as the major infrastructure projects are concerned, it would be necessary to find some special means for development based on specific economic criteria. Thus far, there has been no authoritative document to obligate the banks to establish a series of points, principles, and yardsticks for implementing their own business and credit policies. The absence of clear economic parameters was also evident during the combining of resources in order to carry out certain special development projects. In Croatia, even fundamental organizational preconditions do not exist, because the Associated Bank was formed only recently.

If increasing exports is the fundamental orientation for development, then individual banks, as well as the banking system as a whole, must turn toward that goal. The development of export-producing facilities, along with an essential structural adjustment of the economy, must take absolute precedence.

[Question] In the debate on the new law, one could frequently hear that the law was good, even too good, and that in its present form it could, because of the current circumstances, also have undesirable consequences. Consequently, among other things, the demand has been made that the law be implemented gradually, and that there be an adjustment period. What is meant by this?

[Answer] The new regulation will begin to take effect at a time of difficult circumstances of increased losses, poor liquidity, an unsettled situation in regard to permanently revolving funds, differences in exchange rates, and high losses that have not been covered and paper assets in the banks. Without a prior financial consolidation of the economy and the banks, implementing the law would indeed cause major problems and dislocations. For that reason, it has been proposed that some of its provisions should not be implemented during the first year. This primarily pertains to the article that stipulates the liquidity of the business banks and its founders, and to the stipulation of the criteria for credit worthiness. The time should be utilized to settle the financial disorder in the economy and the banks, and this is the only case that would justify the so-called transition period.

[Question] Stipulating the liquidity of the banks and the economy is in fact the most important element of increased responsibility in the area of business policies. The responsibility of the bank members is proportional to their share of the bank's assets. This has caused some claim that we are introducing into our finances elements of a shareholding and profit-oriented system.

[Answer] I really think that we should be clear about what we want. Either we will conduct business on the basis of sound economic criteria, and the banks will become truly responsible economic entities, or else we will succumb to political phraseology.

[Question] The stipulation dealing with the amount of deposits and the right to manage has generated the conclusion that the banks will in fact be ruled by their greatest debtors. This was undoubtedly an allusion to the situation in the largest business bank in Croatia. Does such an objection have any basis in fact?

[Answer] The banks are managed exclusively by their founders and social juridical persons. It is necessary to point this out in order to remove all doubts and possible misunderstandings regarding the social nature of banks and the socio-economic relationships that will develop in them. The management of a bank is based on the volume of deposited and associated funds, and the quality of such funds. This is a key question for overcoming the situation where those who had minimal deposits in the bank were on an equal footing in regard to management, as were those who managed poorly and even suffered losses, with those who had deposited major sums of money and who furthermore managed the money wisely.

[Question] In our banking system, the associated banks have always had a somewhat inferior position because the lawmakers limited their area of work and business. Does the new law bring any improvements?

[Answer] In Yugoslavia, only the basic banks can conduct all the banking functions, from taking in people's savings to doing business with foreign countries. This has brought about a not completely desirable systemic superiority of the business banks vis-a-vis the associated banks which, for example, cannot use any source to form their own deposits and invest them independently in the form of credits. In reality, associated banks are powerless giants because their founding and conduct of business are in the hands of the basic banks.

[Question] Tying the hands of the associated banks could also be taken as an attempt to prevent having financial dealings be restricted to a single republic.

[Answer] It seems more likely to me that the real reason for the undefined position of the associated banks is their powerlessness vis-a-vis regional trends and retrenchments. As a matter of fact, integration at republic level, through associated banks, must be and should be the greatest obstacle to regionalism. At any rate, there is nothing to prevent the associated banks, once they are formed, to associate at the federal level. The reason and motive for such links could be developmental projects having an all-Yugoslav significance. Consequently, it is possible to build, but not destroy, solidarity and unity through the associated banks.

[Question] Recently, the utmost attention has been paid to the so-called paper assets in banks. Depending on the source, these assets can be measured in thousands of billions of new dinars. It has been said that these nonexistent funds are the major impetus for inflation and instability in Yugoslavia. Where do these phantoms come from and how can we rid ourselves of them?

[Answer] Undoubtedly, there are huge amounts of unreliable and nonexistent claims, as well as those that have been written off, that are rolling through the banking channels. It would be difficult to talk of specific amounts, because, in addition to differences in exchange rates, they have not been figured out exactly. These financial phantoms have been created in several different ways. The main ones are uncovered differences in exchange rates, claims against organizations operating at a loss that are facing bankruptcy proceedings, and low quality and worthless assets. The removal of these paper assets is one of the basic preconditions for the stable conduct of business and the non-inflationary financing of reproduction. How can this be achieved? In the first place, by removing the focal points of exchange rate differences, which the new law on foreign exchange does to a large extent. Furthermore, it would be necessary to spread the burden of existing but uncovered exchange rate differences over longer periods, with a special law. An important link in this process of consolidation should also be the definitive solution for the mutual debts between the National Bank of Yugoslavia and the business banks. The future profitability of the banking business would immediately prevent the formation of losses in banks. Each bank should reevaluate its own claims, and, if there is no other way out, seek a solution through a rescheduling, a process of restoring profitability, or, as a last resort, by liquidating the hopeless debtor.

[Question] What can the government offer in this context, and how do you interpret the position of the Yugoslav presidency that has devoted the most attention especially to the removal of such paper assets in the banks and in the economy?

[Answer] I think that the presidency, being fully aware of the real trends, has established a rational order of priorities in which, for good reason, the financial consolidation of the economy and the banks is the starting point for the overall process of stabilizing our economy.

[Question] The law on foreign exchange has been adopted recently, through an accelerated procedure. Do its stipulations also follow the line of the basic aims of the law on the banking business?

[Answer] I have not noticed any major divergences between the two laws. They aim for permanent liquidity for the dinar, without which both laws will have failed. Both laws define and specify the role and responsibility of the banks in an exceptionally sharp manner. They regulate in a similar manner the possibilities for incurring debts in Yugoslavia and abroad, as well as the basic conditions for conducting the banking business.

[Question] Can the new laws help bring about increased confidence on the part of foreign financial centers, and can they help improve the credit worthiness of Yugoslav banks abroad and ensure their return to the world financial markets?

[Answer] Foreign countries are carefully monitoring the new legislative solutions and events in our economy. This has been confirmed in talks I have had with representatives of foreign banks. They view as positive the fact that the laws are introducing economic criteria into our economy gradually, and they welcome their greater flexibility in regard to systematic solutions aimed at enhancing mutual economic exchanges. One can expect an increase in confidence, however, only when our economy becomes a more serious and reliable partner for the developed West.

[Question] One of the most painful points in our relations with foreign countries are the debts. In Croatia, they are concentrated primarily in the Economic Bank of Zagreb. Does the fact that from now on foreign exchange debts can be repaid by purchasing foreign exchange for dinars improve or change the position of the greatest debtors of this bank?

[Answer] One thing that is certain is the decrease in the pressure for foreign exchange liquidity. The former mechanism of ensuring foreign exchange for the repayment of debts through institutionalized solidarity has disappeared. In a way, that mechanism has helped to bridge the gaps created by a lack of dinar funds. Now, the dinar aspect of the debt is coming to the fore, instead of foreign exchange; consequently, a completely new strategy will be necessary to remove the difficulties facing us. Actually, these difficulties are facing all of the major industries associated with the infrastructure, especially the electric power industry, to give an example. It is also clear, however, that the troubles facing those debtors are not only theirs or only of the Economic Bank. This is a matter involving property with a broad social significance, and the entire economy will have to help, as it did in the past.

[Question] The problem of the internal, i.e. dinar, liquidity of debts is impossible to consider without taking into account the interest rate policy. High interest rates harmonized with inflation have become in Yugoslavia a battlefield for various views on how to stabilize the Yugoslav economy. It would be interesting to hear your views on the controversial policy of real interest rates.

[Answer] Real, i.e. positive interest rates are one of the basic and underlying axioms of a market economy. Real interest rates, however, can do their job only in a situation where the economy owns 85 percent of its resources and utilizes loans only to get over the "spikes" encountered in doing business, because it is not profitable to have all the revolving funds on hand all the time. They will not be effective if they are introducing into an economy which in general does not operate in accordance with economic laws and which, for the most part, has no money of its own. The only consequence would be an even greater increase in prices. This discord has its roots in a decade of doing business without having real prices be a factor in production, at a time of exceptionally cheap credit. Past attempts to harmonize the interest rates with inflation resulted in a further devaluation of revolving funds, because the big money has been "siphoned off" into private pockets.

Furthermore, experiences in applying a policy of positive interest rates confirm that the interest rates were measured off in a linear manner, without any sense for the differences in the economy, for developmental and stabilizing priorities. They are tied to inflation, which was increasing on a daily basis. The only possible conclusion is to decrease the growth of prices.

OFFICER SCHOOL ACTIVITIES OVER PAST FIVE YEARS REVIEWED

Warsaw PRZEGLAD WOJSK LADOWYCH in Polish No 10, Oct 85 pp 5-7

[Article by Brigadier Dr Stanislaw Zak, head of the Military School System Directorate, and Col Dr Edward Szumer, "A Hard Working Five Years for Higher Officer Schools"]

[Text] Higher Officer Schools [WSO] have inaugurated the 1981-85 period with a clearly defined program of action. Its significance was expressed in the guidelines issued by the Council for Higher Military School System at its plenary session in June 1979; it elaborated on an earlier directive by the Ministry of National Defense which has recommended "...improvement in the standing of higher officer schools, expansion of their ever growing scholarly activity, turning leading courses into chairs, intensified granting of academic degrees."

According to this recommendation by the Council's chairman, the minister of national defense, the main effort has since been focused on improving the quality of the didactic process, as well as of education and research, by linking organizational reforms to accomplishments in those areas, pivotal for the functioning of the schools. We would like, therefore, to draw the readers' attention to some development processes, under way in the WSOs, in particular in the model ones.

The organizational structure to promote the most significant teaching and educational functions of the WSO's, has been defined in the new 1981 edition of "Principal premises for cadet training in the WSOs," as well as in the curricula and educational programs, amended to conform to these premises.

The document, which sets up the WSO targets for the entire decade, points out, inter alia: "...the requirements for the 1980s inspire the need to set up qualitatively higher standards for the WSOs, in accordance with the cultural, scholarly, and technological levels of development. The schools should train new cadres of military experts, even better prepared for their future civic and professional roles, endowed with the necessary proficiency and personal values."

The document prescribes the personal and professional model to define the image of WSO graduates. On one hand, it expresses the general goals and contents of training; on the other, it sets up guidelines for preparation of professional character traits of the graduates, that is to say, an empirical model of WSO graduates for every specific training line and for every specific military specialization.

When curricula were first structured, professional characteristics of graduates were spelled out for the first time, to indicate detailed targets and selection of educational contents. Results of the research project "Methodology of structuring the WSO curricula" were also allowed for.

The "Principal premises etc." has endorsed a new form of training,--alternate courses tentatively introduced several years earlier. In higher professional military schools they had proved their full effectiveness, allowing for rational redirection of study and education processes, not divorced from real life, and for better and fuller preparation of graduates to discharge their functions and duties at their first operational levels in military units. Long-term (educational) apprenticeships have also contributed to the shaping of more profound motivation for the military profession among cadets, and at the same time stimulated their verification.

Research projects carried out during such experimental alternate courses have confirmed the hypothetical expectations concerning the efficiency of this form of training. In particular, they promoted higher levels of practical knowledge, as well as talents and habits of command, instruction, and education. Prolonged service with military units favored familiarity with the socioprofessional milieu, and shaped desirable habits in service and work, as well as self-confidence and resourcefulness; it brought intimate knowledge of combat and technological equipment. The universal introduction of alternate courses in the WSOs has been a major achievement of the last 5 year period.

Graduates' Professional Proficiency

The top levels in the Ministry of National Defense have also paid major attention to the problems of quality of training and educational processes. In 1984 alone, three consecutive sessions of the Council for the Higher Military School System dealt comprehensively with many problems essential for these schools. Some of them were as follows:

--"Analyzing and evaluating the process of shaping the personality of WSO cadets, in particular as far as ideopolitical and moral attitudes are concerned."

--Analyzing and evaluating the process of shaping command, military specialist, and pedagogic proficiency of WSO cadets."

--"Evaluating WSO organizational structures and prospects for their continuing development of the chair system."

--"The current state and development prospects of the WSO infrastructure."

The document prepared for consecutive sessions of the Council, the analyses, conclusions, and suggestions presented there, as well as recommendations passed, constitute a valuable theoretical contribution to military schooling, as well as methodological guidelines for further improvement of the teaching and educational processes in the WSOs.

Their implementation includes, among other things, introduction of a new subject in the curricula, called "Basics of Command." This discipline, which covers the psychological and sociological, as well as practical aspects of command functions, provides a good theoretical basis for the development of such talents, needed by every officer.

Major attention has been paid to professional proficiency of WSO graduates, defining its scopes and modes of shaping. Professional proficiency is defined by the scope of acquired knowledge, as well as by inculcated know-how and competence. As far as officers, WSO graduates, are concerned, the range of their command, their military expertise, and their pedagogical proficiency are of primary significance, especially during the first period of their professional duties. After all, on those values, as well as on their ideopolitical proficiency, the graduates' ability to discharge their functions at the lowest command level depends. To define the components of professional proficiency, it has been determined that:

--command proficiency is defined as a syndrome of personal and professional predispositions, intellectual and proficiency ones in particular, which allow the graduates rationally to command the soldiers' troop (sub-unit) consigned to them, both in peacetime and in war, according to the praxeological principles and to the letter of military regulations and rules, combined with easy use of the regulations language;

--pedagogical proficiency is defined as a syndrome of personal and professional traits, including in particular the acquired knowledge and officer's know-how, which would allow them in the most rational, lucid, and effective manner to shape the convictions and the attitudes of soldiers, as well as to educate and to train them;

--military expertise proficiency is defined as a syndrome of personal and professional predispositions, including in particular the know-how and competence which should characterize an officer-specialist in a given armed service branch. In addition to theoretical knowledge proper, familiarity with equipment and weapons, ability to make use in combat of their technological and military propensities, and knowledge of their proper maintenance conforming to the set standards, are of particular importance.

Many practical guidelines concerning the essential components of the training process in the WSOs derive from the above mentioned instructions and definitions, which constitute a valuable contribution by the Council for Higher Military School System.

A major role in elaborating and propagating didactic innovations, especially in the area of methodology of teaching, has been played by the Joint WSO Commanders, established in 1979 and acting as a permanent advisory body to the Council for Higher Military School System. The regular operational modes of this body, and above all its meetings held at extramural sessions, each time in a different WSO (training center), as well as the preparation of materials for such session, presentation of most successful model solutions of organizational and methodological problems, opportunity for unconstrained exchange of views and experiences--all that provides a unique platform which promotes improvement of the entire operational process of the WSOs.

Scholarly Development of Cadres.

Scholarly and methodological conferences, held since 1982, are a new initiative of the last 5-year period, and have been adopted and substantiated within the timeframe of militry training. They are devoted to separate disciplines or groups of disciplines, and allow for acquaintance in depth with their problems, and for formulation of organizational and methodological guidelines which insure unification of teaching and educational processes throughout the military school system. The previous conferences held within the WSO structure were devoted to problems of tactics (1982), firepower (1983), and ideological and educational work in a training sub-unit (1984). In 1986 another conference, devoted to teaching of the subject, "The ABC's of Command," will be held.

The 1981-85 period was also of major significance for improving and developing WSO research projects. This activity has been focused on a broadly conceived study of didactics in the WSOs, in particular as far as their curricula, specific methodology, and effectiveness of didactic measures are concerned. Some projects were directed at problems of tactics and firepower. Wherever conditions and means permitted, some schools have come to grips with technological problems, including those linked to the national economy. This was, in particular, the case of WOSS, WOSR, and WSOWCh.

Major porgress in acquiring PhD degress by teaching cadres has become a target and the result of research activities. Since early 1981, the number of officers with academic degrees has gone up by 72 percent; number of doctors of military studies, the most important group among graduated WSO cadres, has quadrupled. The first assistant-professor theses have also appeared: Col Ryszard Majewski of WSOWZ in the humanities, and Mjr Bogdan Zoltowski of WSOWRiA in technological sciences. It indicates a higher quality level in the scholarly development of cadres, and provides good prospects for the coming 5-year period.

The scholarly development of cadres has provided a major lever for improved quality of teaching and educational processes in the WSOs. Lively intellectual activity and increased range of professional knowledge directly affect the level of teaching and the teacher's prestige. A higher level of proficiency of the teaching cadres is closely linked to their increased ability to influence cadets. Thanks to their own scholarly contributions and to the results of their research, diplomed teachers enrich the knowledge imparted to cadets.

Under such circumstances, the teaching process acquires a new dimension, more attractive, inspiring, and at the same time practical one. The rejuvenation of teaching and scholarly cadres, inaugurated during the last 5 years, has been of major importance for the scholarly development of the schools. In many cases scholarly degrees have already been granted to graduates of the first WSO classes of the 1970s; this bodes well for acquiring assistant-professor degrees in those schools.

The recent organizational snd structural reforms of the WSOs followed the scholarly development of their cadres and the positive changes in the teaching and educational processes. The number of chairs has grown by 75 percent, in some WSOs approaching the target [WSOWI], while Research Teams for Methodology of Teaching have been turned into Institutes for Military Didactics. Lectorates of foreign languages have been granted separate entity and autonomy, as Foreign Language Studies. Following the proven experience of the military academies, joint positions for scholarly and teaching cadres and for auxiliary staff have been introduced throughout the WSOs, thus permitting the school commnnders to better structure the entire corps of military academic teachers, according to the tasks alloted to their various links (chairs, institutes, courses).

Thanks to the inspiration of the WSO commands and of top levels in the Higher Military School System, and with significant assistance of the Chief Inspector for Training, of the Main Directorate for Combat Training, and of military districts and armed services commands, a modern, even unique in some of its solutions, material and teaching basis has recently been established, in particular as far as tactics and special tactics training are concerned. The use of computer technology in teaching, as well as in managing and running schools, has been introduced on an increasingly broad scale. Scholarly libraries have expanded: in addition to their primary functions--information and service--they have began to play teaching and scholarly role as well.

We are aware of all the weaknesses which have afflicted the WSOs over the last 5 years. They include, among others, a high percentage of dropout cadets, in particular during the first and second year of studies; difficulty in achieving at least a satisfactory level of general military preparation of graduates; uneven scholarly development of cadres in various schools; and, finally, the still unsatisfactory from our point of view progress in improving the living and social standards of cadets.

However, in the last 5 years, the prevailing trait was systematic progress in the entire functioning of the WSOs. A synthetic and credible indicator for such progress results from inspection, to which all the WSOs were submitted during this period, some of them even twice. In each case the marks were "good". Nearly 75 percent of the WSOs were honored by recommendation in the annual training reports of the minister of national defense, some of them even twice [WSOWI] or three times [WSOWOPL, WSOSK]. In acknowledgement of their contribution to the development of the armed forces, the PPR Council of State granted the Higher Officer School for Mechanized Troops and the Higher Officer School for Armored Troops the Banner of Labor Order, 1st Class, to mark their 40th anniversary.

The WSOs, preparing the future professional cadres of the armed forces at a level conforming to the contemporary military thought and technological progress, and systematically improving the performance of their teaching and research duties, have become an essential component of our country's defense capability; the educational system, elaborated and implemented by those schools, tested under the difficult social and political conditions of the early 1980s, should be particularly stressed.

The last 5 years, for most WSOs crowned by their 40th anniversary, has therefore been in almost all its aspects put to good account in implementing the previously quoted guidelines of the Ministry of National Defense. The ongoing development processes in these schools provide a good basis to let in the second half of the 1980s.

RELATIONS OF WORKERS WITH EDUCATED CLASSES DEFINED

Prague NOVA MYSL in Czech No 12, 1985 pp 32-41

[Article by Rudolf Franek: "Timely Questions of Workers' Relations with the Intelligentsia"]

[Excerpts] The birth and advance of socialism are lawfully linked with the leading role of the workers class under the direction of the communist party. Yet, the workers class can fulfill its historical role only in association with the other working people. The character of this association, however, its tasks and problems, do not remain static, but rather change and develop in relationship with the overall character of society, the degrees and stages of its development, as well as its corresponding main tasks and goals.

While during the period immediately following the socialist revolution, the workers class wielded its power in association with small and medium farmers, retail producers and the intelligentsia, at the present time it does so in union with the cooperative farmers class, the intelligentsia and other working people. This union has a socialist character not only in the substance of these classes' tasks but also in the character of these classes and groupings and their mutual relations. This does not exclude a differing degree of socialist consciousness and maturity in members of this union or individual components of these groupings and classes.

One of the vital tasks in the realization of qualitatively new tasks is the transition from largely extensive economic development to intensive economic and social systems. The principal instrument in this goal is significant acceleration in scientific and technological development. This brings about a whole complex of wide-ranging and demanding problems and tasks. In terms of difficulty, they are compared with the resolution of such past problems as industrialization and collectivization. Fundamentally, it is a question of qualitatively new problems which it is necessary to master.

In the process of building an advanced socialist society, which includes the realization of the above-mentioned tasks, there is a higher and more extensive impact of the subjective factor, the importance of its readiness and ability to master demanding tasks and apply them in practical terms. In the sphere of social sciences, this confronts us with the need to devote priority attention to the basic moving forces which decisively influence the future advance of socialism, their fundamental interests and mutual relations. A part of this task is research on the character and evolution of the social class structure, especially the processes of bringing classes and groupings together and formulating and strengthening the individual's socialist profile and way of life.

Our society's principal tasks in the realization of the strategic line of building advanced socialism were set in the resolutions of our party congresses. These tasks include the strengrhening of the leading role of the workers class and the communist party, transition to an intensive economy, intensification of socialist relations in society, bringing together of social classes and groupings, town and country, physical and mental endeavor, formulating the development of a new mentality in people, etc.

Our future tasks were also formulated at the 15th Central Committee session which analyzed the current state of affairs and revealed the weaknesses and untapped reserves in our development. Great emphasis was again placed on accelerated application of scientific and technological advances in our everyday life. It is in the realization of this key task that the importance of a firm union between the workers class and the intelligentsia comes to the fore. It is sometimes asked whether current or future changes in this sphere might not be in some way reducing the role of the workers class. In searching for the truth in this matter, we should not consider merely the narrow professional and technical aspect, even less only certain of its components.

Marxist-Leninist theory has scientifically documented the fact that even in the period of the scientific and technological revolution there is no abolition nor reduction of the leading role of the workers class. There are a number of good reasons for this. The most important is that the workers class, even more than the other classes and groupings, has an interest in the acceleration of scientific and technological progress in all its fundamental aspects and relationships. Its interest is linked with a comprehensive understanding and desire to implement such progress. The workers class is indeed the principal guarantor of a process in which advances in this field will be subordinated to the fundamental tasks and aims of a socialist society as a whole, thus also in the interest of all the other working people. The workers class is able to make sure that these priority tasks emanate from the goals of the socialist revolution, the building of socialism and communism. The interest of the workers class stems from its position in the socialist division of labor, a position which makes it even more interested in this sphere than the other classes and groupings. From this it follows that the workers class wants qualitative changes in this division of labor and their impact on the social class structure. In the current stage it is mainly a question of the character and substance of labor, the significant differences between physical and mental endeavor, between research and management, etc., and the social consequences of such division of labor.

Scientific and technological advances enable the workers class to gradually contribute to the fruition of its aims and interests. At the same time, it should be remembered that scientific and technological progress is only one factor affecting the future, albeit an important and vital one. Even today the workers class represents the principal and immediate producer of material values which make scientific and technological progress possible. The workers class is interested in both quantitative growth of production and its higher quality.

The growth of production and its metamorphoses are linked to satisfying the needs of the workers class and the other working people, including the process of further emancipation from the old type of division of labor. The contemporary production process in industry and some other branches, e.g., agriculture, still encompasses a considerable extent of physical or predominantly physical labor, accompanied by physically demanding work, monotony, unfavorable working and environmental conditions, all of which brings about undesirable social consequences.

Despite already implemented significant changes in the CSSR industry and other branches, results of research show that a large portion of workers still performs predominantly manual labor. Research in selected Czech and Slovak industrial enterprises, for example, indicates that, on the average, labor performed by the blue collar workers is physically still much more strenuous than that performed by white collar staffs and the intelligentsia. Based on results of research, we can thus state that the differences between physical and intellectual endeavor, as represented by the above-mentioned groups, are still considerable throughout our industry. Significant differences are also found in the level of education, even though in this sphere the process of rapprochement is somewhat more rapid than in the character and substance of labor as such. This process of rapprochement is significantly aided at this time by the introduction of compulsory middle schooling of 10-year duration for all members of the young generation.

In the period of scientific and technological progress, the significance of the leading role of the workers class increases rather than diminishes, while its numbers remain steady. The workers class represents a mighty source of creative forces and talent.

The character of the intelligentsia's social position and tasks should not be derived merely from quantitative data nor from the very development of science, technology, education and social upbringing. In other words, the importance of this social grouping cannot derive from narrow professional aspects, nor even from the technical, production and specialized vantage points. The social position and role of the intelligentsia is determined primarily by its social, economic and political function, as well as by the relationships of its place and work in a given society. This is because science, technology, culture, education and other areas in which it is active are socially conditioned and have social consequences. The professional activity of this social grouping is heavily dependent on the character of a given society, its tasks and developmental dynamism.

Scientific and technological progress faces the following two sets of problems:

1. Resolution of specific issues concerning the substance and methods of individual scientific disciplines or groups thereof, while natural and technical sciences examine the natural laws which are independent of the character of a social system.

2. Resolution of problems which are socially dependent and which are related, above all, to conditions of scientific and technological development, their application in everyday life, their benefits to society, etc.

The principal task of science and technology is to contribute to higher effectiveness of production, based on technological, production and organizational innovations. In socialist societies, social effectiveness of production and other labor processes comes to the fore.

Scientific and technological progress contributes in a specific manner to the intensification of relations between the intelligentsia and society as a whole, notably relations between the workers class and the intelligentsia. This is brought forth by certain new types of relationships between science and technology on the one hand and production and practical application on the other. In the period of the industrial revolution, scientific and technological progress was, more or less, isolated from production, since the degree of intermeshing was relatively weak and remote in time. In addition, there was the fact that the process of scientific and technological advancement, even though relatively concrete, was divorced from society as a whole.

At the present time the situation is quite different. The cycle of science--technology--production--use, constitute a unified system in which the time between discovery and its introduction into production has been reduced significantly. Development in production presents science and technology with not only quite concrete tasks, but also with increasingly broader ones which are becoming more of a strategic nature. This is related to the necessary advance of science over technology and production. For the scientific and technological intelligentsia this creates the need for a more intensive relationship between its endeavor and societal development. Knowledge of the trend in a socialist society in all its fundamental aspects (economic, social class structure, class rapprochement, the political sphere, including worker participation in management, the ideological area and a whole new way of life) requires of members of the intelligentsia a high degree of identification with socialism, its future developmental needs, as well as with the interests of the principal social classes and groupings, notably the workers class.

Realization of scientific and technological progress in conditions of building advanced socialism, not only formulates for the intelligentsia qualitatively new tasks but also offers it enormous opportunities for the application of its creative talents and skills in social practices. This is indeed in its own interest, as well as in the interest of society as a whole. The establishment of harmony between the intelligentsia's new tasks and the conditions for its successful endeavor represents a very complicated process in which many objective and subjective obstacles must be overcome.

Besides the already-mentioned new relationship of science, technology and production, the following tasks and problems come to the fore in the intelligentsia's future endeavor:

-- intensification of cooperation between science and technology, i.e., between scientists and technicians;

-- application of a comprehensive, systemmic and inter-discipline approach in the resolution of problems. This assumes cooperation not only among technical specialists but also among experts in the sphere of social sciences;

-- intensification of cooperation between technical and social science intelligentsia and members of the workers class as the principal implementors of scientific and technological progress.

A socialist society objectively creates rather propitious conditions for such cooperation. Its quality and results, however, depend not only on concrete conditions in individual spheres of activity but also on the degree of knowledge of and dedication to this cooperation among members of the individual social classes and groupings.

Scientific and technological advance under socialism demands that those working in these disciplines deal not only with the narrow specialized aspect of their endeavor, but also respect its social, economic and political effects on a given organization, as well as on society as a whole. In this connection, there is an important role for the scientists and technicians in their cooperation with those working in social sciences, in the applied social disciplines, such as economy of labor, management and organization of work, ergonomics, sociology and psychology, as well as those oriented on theoretical spheres of societal development.

A significant part of scientific and technological progress is the resolution of the relationship between the worker and the machine. In a socialist society the worker is considered the most important element in scientific and technological advance. Application of this thesis in practice, however, is very demanding. V.G. Afanasief, well-known Soviet author in the sphere of scientific communism and scientific management of society, stresses that scientific and technological workers have the task of "creating machines which do not repress the worker but rather respond to his or her mental and physical capabilities, thus ensuring the best possible conditions for the work performed.... This is an expression of the effort to combine higher productivity with care for the worker's health and his or her physical and intellectual development."

The real social position and task of the intelligentsia, including its professional and social activity, does not depend merely on objective determination, but also to a great extent on the understanding of its objective role and function, especially its relationship with the other classes and groupings, with all the ensuing consequences. This means, above all, understanding of the social economic and social political aspects of its position and role, especially a correct relationship with the workers class and recognition of its leading role not only in theory but also in practice.

The union of the workers class and the social group of the intelligentsia is not the result of merely the effect of objective legalities nor only a reflection of the fundamental interests of these two groups. In the formulation and strengthening of this union in all its stages, the ideological, political and organizational work of the party always played an important role, both within the workers class and among members of the intelligentsia. Understanding and promoting the real social position and function of the intelligentsia has been a part of this effort. Among other things, it was necessary to overcome two extreme views. According to the first, the intelligentsia, or at least its part, is considered a social elite which stands above the other classes and groupings, and whose task it is to lead all of society. The other extreme is underestimation of the intelligentsia's role. The tendency to demean the intelligentsia or even an effort to pit the workers class against it, is an expression of misunderstanding of the fundamental interests and tasks of the workers class, thus lack of preconditions necessary for its union with the toher working people, including the intelligentsia.

Future development of socialism requires the strengthening of the leading role of the workers class and its historical role in the concrete conditions of the current developmental stage. The basic impetus for the unity of the workers class and the intelligentsia is the fact that their fundamental interests are the same. Following the abolition of private ownership of the means of production, the intelligentsia had shed its dependence on the bourgeoisie. Nationalization of the means of production created objectively the same relationship to it by both groupings, with the ensuing consequences for the social status and role for the workers class and the intelligentsia.

The problems of workers class and intelligentsia interests have thus far been examined on a rather general plane, we still lack their more detailed elaboration. Yet, it is important that these interest problems concern not only delineation of the fundamental interest, but also specific interests and the method and degree of mastering knowledge of these interests from different vantage points in terms of both consumer and co-owner of the means of production, i.e., on the level of labor activity, initiative and responsibility.

The alliance of the workers class with the intelligentsia has a multifaceted character. An important role in it is played by direct and indirect social linkage, transition of some workers to the intelligentsia social group, social origin of students and middle and higher school graduates, etc. Other areas common to both are the ideology of the workers class, scientific world outlook, Marxism-Leninism.

Problems of this alliance must not be limited merely to analysis of general trends, basic elements of a joint position, role and interest of the two. The creation and enhancement of the alliance includes not only the establishment of propitious conditions nationwide, but also resolution of these problems at the level of concrete work sites and individual working class and intelligentsia groupings. Research and answers to these questions encompass various vantage points, from the theoretical to the implemental, and should reveal all the important relationships. We still suffer from weaknesses in this area, in terms of both theory and practice.

Speaking of practical terms, in industrial enterprises and plants, for example, there is a certain underestimation of the work of preproduction components, with a consequent underrating of the technical intelligentsia. There are also some shortcomings in material and moral stimulation. So far, there has been insufficient implementation of party and state resolutions on greater differentiation in rewarding, based on the real contribution of individual employees and collectives toward advancement of production, science and technology, individual plants themselves, and the interests of society as a whole.

An important role in the enhancement of the alliance between manual workers and the intelligentsia rests on the complex rationalization brigades. This form of strengthening the union makes it possible to intensify cooperation and a joint endeavor of workers, cooperative farmers and the scientific and technological intelligentsia, to overcome parochial sphere, branch and enterprise barriers, thus promoting the unity of the workers class and the intelligentsia. The inclusion of workers collectives in the broader picture of resolving problems in development, production and introduction of new technology into practical use, is a part of this process.

Currently, there are certain shortcomings in the character and degree of correct interpretation of the social position and role of the intelligentsia in the implementation of scientific and technological progress. As noted by J. Obzina, there appear among certain members of the intelligentsia elements of uncertainty on how their conceptual programs, expert advice and proposals will be received. Part of the intelligentsia also fails to promote their ideas in practice with sufficient fervor and emphasis, tending to be deterred by obstacles. The realization of scientific and technological progress, therefore, encompasses both the substantive and social dimensions.

EUROPEAN CULTURAL FORUM EVALUATED

Prague TVORBA in Czech 18 Dec 85 p 3

[Article by Ilja Hulinsky: "Reflections on the Budapest Cultural Forum"]

[Excerpts] The Czechoslovak delegation arrived in Budapest with a clear line to make the cultural forum successful so that it contributes to the strengthening of the Helsinki process and its further overall development. Our delegation therefore consistently strove at the cultural forum for a businesslike and constructive dialogue in all sections of its commission (artistic production, dissemination and cooperation in the area of culture) through cooperation in regard to the problems which the participating countries share. It systematically tried to prevent the discussion at the cultural forum from slipping down, in contrast to the Helsinki Final Act, into senseless polemics about the ideological issues which separate the participating countries and on which therefore they cannot reach agreement.

From the very outset of proceedings at the cultural forum two tendencies intertwined perspicuously. On the one hand, there was the tendency to make the cultural forum positively affect the development of overall, mutually advantageous cooperation in Europe and to contribute to mutual understanding. On the other hand, there was the tendency revealing obvious lack of political will to participate in the measures which would promote the process initiated at Helsinki in 1975. In short--the line of supporters of and opponents to the detente. It is characteristic of the discussions at the cultural forum that this line did not represent only the dividing line between the delegations, but it frequently ran within the individual delegations, that it was often possible to trace it even in the speeches of representatives of one and the same delegation.

And it is necessary to state that, despite the rigidly ideological, in fact antagonistic approaches the members of the delegations from the ranks of major personalities of cultural life of their countries let themselves only in exceptional instances to be misused for the indignified attacks on cultural policy of socialist countries and against the very idea of peaceful cooperation of European culture in its entire national diversity and ideological differences. For illustration of the atmosphere at the conference mention should be made of the following incident: A member of one of the largest and least constructive Western delegation looked up the members of the Czechoslovak delegation with the excuse for his speech in which he had repeated the cliche about the inappropriateness of the socialist state's interference in the artistic production and dissemination of artistic value pointing out that this passage was inserted in his speech by the political advisers of his delegation.

From the proceedings at the cultural forum it was apparent to what extent the realistic forces of all delegations realized their responsibility for the indispensable restoration of the constructive dialogue in all areas of the Helsinki Final Act, for the necessity to fight particularly in the present situation for the return to relaxation of tension. In this respect it is significant that laborious negotiations on the meaningful final document of the cultural forum for whose adoption these forces (and particularly the artists) in all delegations strove ultimately intensified antagonisms between the countries of Western Europe and the United States. Both the existing antagonisms in the questions of cultural policy and questions of approach to the Helsinki process itself in whose preservation the Western Europe is eminently interested. Also from this standpoint it is clear, why the proceedings of the cultural forum were not significantly affected by various attempts of groups of private persons around the so-called antiforum which were magnified out of proportion by certain Western media. One could feel too much from their frustrated political ambitions, though disguised as interest in culture; they acted too closely hand in hand with the protagonists of the line of opponents to the relaxation of tension and constructive cooperation of countries with different social systems. They were thus quite apparently in conflict with the spirit which at the cultural forum crystalized in its conclusion: To achieve that also from the cultural forum one could hear the expression of good will--to embark on the road announced in Geneva, to learn to live together.

The cultural forum stimulated an active participation of culture in the Helsinki process. Most of the delegations at the forum consisted of really important representatives of culture and arts. Precisely these representatives in the governmental delegations of Europe's East and West lent the work of the cultural forum its businesslike and constructive character.

The work organ for questions of dramatic arts (theater, music, ballet, folklore, cultural programs on radio and [illegible]) offered, because of the wide range of problems and conceptual content, [illegible] opportunity for sharper confrontations of different concepts of the function and position of culture. Nevertheless, a number of problems of development of dramaturgy and cultural exchange were evaluated with great responsibility. The Czechoslovak proposal for greater cooperation within the major European music festivals met with considerable response. Members of the Western delegations expressed very favorable opinions about the contribution of the Karlovy Vary (Carlsbad) festival of TV and film schools. A lively discussion was evoked by the proposals concerning the so-called "free skies" and a joint cultural TV channel transmitted by a satellite. These proposals, however, met with opposition also of smaller West European countries which criticized them from the standpoint of penetration of American culture into Europe and violation of national cultural identity.

In the work section for the area of literature and publishing the discussion was held on a high intellectual level with the concrete proposals for intensified cooperation particularly in the area of translations, joint editions, prose and poetry and so on. The convincing evidence of the big number of copies of Western authors' works published in the socialist countries, however, was demagogically contradicted by some Western representatives that these works were allegedly published for statistics sake only because they never get to the readers. At the same time they tried to prove that the Western publishing houses could not afford to publish the books of authors from the socialist countries because they were under the pressure of readers' taste. In the course of proceedings disturbed by the negativist attitude of some representatives of the United States and Great Britain, continuous reminders of so-called dissident authors and so on (in this context "arguments" were used about nonpublishing of J. Seifert's works in Czechoslovakia), however, a differentiation took place within the delegations of Western countries. Most of the delegates tried to revert the discussion to the serious topics. Author Gunther Grass expressed fear about the fact that Europe is turning into an arsenal overfilled with nuclear missiles. He proposed to set up in Budapest or Vienna a center for coordination of cooperation and contacts between East and West in the area of culture.

The cultural forum was thus dominated by the tendency for a constructive dialogue, mutual understanding of attitudes and positions, although it was apparent that it would be necessary to do away with bias and preconceived ideas also in the future. Too many Western delegates engaged in polemics not about the real concepts and shortcomings of socialist countries, but rather about their own ideas and illusions about these concepts and shortcomings. The proceedings at the cultural forum, however, made it clear that the road of a constructive dialogue was realistic, that even in the present divided world there was enough intellectual potential which the creators of culture were able to put at the service of rapprochement and understanding among the nations, at the service of strengthening the atmosphere of mutual respect and trust.

The proceedings of the cultural forum have produced a multitude of specific proposals for expanding international cooperation. They pertained to both general and specific problems of various areas of culture including the creation of conditions which will be more favorable for authentic artistic values than for almost mass produced cultural imitations. The proposals of major cultural figures from various countries contained also in this respect valuable suggestions calling for the establishment of a system of protection of cultural values in the areas of music, film, literature and creative arts.

Most of these proposals can be implemented after bilateral or multilateral negotiations although they were not included in the final document of the cultural forum. Moreover, during the concluding intensive negotiations on the potential wording of the final document there was among the delegations absolute agreement that the Budapest forum was a valuable contribution for development of mutual understanding, expansion of international cooperation and cultural exchange, and that the results of its work, including the proposals submitted in accordance with the principles and provisions of the Helsinki Final Act, will be communicated to and taken into account by the next subsequent meeting of states of the Conference on Security and Cooperation in Europe of the Belgrade and Madrid type which will convene in Vienna in fall 1986.

These two ideas among others were included also in the draft of the final report which was submitted in the concluding hours of the conference by the host country--the Hungarian People's Republic.

As to our delegation, it must be pointed out that among more than 115 formal proposals submitted to the cultural forum, 21 were submitted by Czechoslovakia. Among them was also the joint proposal of the CSSR, GDR and USSR which contains an appeal to all artists and cultural workers to help with their creative work to strengthen in the world community the ideas of peace, antimilitarism, social progress, mutual understanding and friendship among the nations. Among them was also the draft of a resolution condemning psychological warfare, dissemination of untruths and lies among the nations.

Attention of the Budapest cultural forum participants was attracted also by our other proposals such as for international conferences on protection of cultural monuments and historical towns, on cooperation in the area of design, on evaluation of experiences with the construction of new art galleries, on long-term loans of exhibit from galleries, on the organization of festivals of young creative artists, on the establishment of a European forum of young music and also the proposals which arose during the comparison of creative results from the area of pantomine or satirical films. With equal response was met also the proposal for intensified exchange of radio plays or protection of children from the effect of films and television shows portraying brutality, violence and pornography. With understanding were met also the proposals for intensified cooperation in publishing the literature for children and young people, for exchange of literary and illustrative materials, mutual joint production in publishing literature and so on.

Despite the fact that due to the negative attitude of several Western delegations (particularly of the United States and Great Britain), agreement could not be reached on the comprehensive final document (and the Romanian delegation did not give its consent to the adoption of a short final report) as a positive result of the cultural forum can be regarded the fact that in the atmosphere of an intensive dialogue its participants were able to search for and indicate the common points of interest important for the development of European culture, and to propose also a number of very specific, often new forms of intensified cooperation in the cultural area among the states--signatories of the Helsinki Final Act. The contribution of the cultural forum lies thus in the fact that, despite encounters of distinct views, it was possible to explore the ways for the restoration of a businesslike and constructive dialogue within the Helsinki process and on its basis.

The cultural forum, however, had one more aspect which was clearly apparent in all its proceedings: consciousness that artists and cultural workers also bear the historic responsibility for peace and progress, for preservation of the cultural heritage of mankind. The actual result of the cultural forum thus points to a more hopeful future which was opened by the historic meeting of the highest representatives of the USSR and United States in Geneva.

HOUSING SHORTAGE CONTINUES

Prague RUDE PRAVO in Czech 29 Dec 85 p 3

[Article by Marie Konigova: "What Is Talked About"]

[Text] Apartments, apartments, apartments. A magic formula by means of which people were accustomed to evaluating the standard of living. On the other hand, one can often hear that the lack of housing units is a significant factor affecting even the high divorce rate, among other things. It all depends on the persons who are just talking about this subject, such as people who have applied for an apartment; or others who are planning a family and do not want to bring their child into the cramped apartment of their parents; or finally those who justify their family problems by not getting along with their fathers- or mothers-in-law. In any of these cases, however, the final words are: "just to have our own apartment...."

Toward the end of the year the subject of new housing units attracts more attention than ever. Why is that? The answer may lie in the presentation of Miroslav Mrazek, deputy and common correspondent of the Czech National Council Committees at the recent 19th meeting of the highest Board of Representatives in the CSR. He said: "I should mention also the state of fulfilling the plan of complex apartmental housing construction, especially in Prague. At the end of this year's third quarter only 420 units were completed here, which equals barely 5 percent of the annual task." He was quite justified to add that even when it is possible to catch up on many things in the coming period, the quality of work and effectiveness will certainly not benefit from it. He was also right in stating that the mistake lies in an incorrect approach to the way in which the planned tasks are being fulfilled.

Year by year the following situation occurs repeatedly: in the last trimester approximately 90 percent of housing units are waiting to be completed. However, deputy Miroslav Mrazek emphasized the following in his presentation: "Next year this kind of approach will not be possible. It will simply be ruled out by the challenging targets of the next year's state plan and the state budget issuing from it."

However, such was also the spirit in which also deputy Alois Olsan spoke a year ago, as well as deputy Miloslav Storkan and CSR Finance Minister Jaroslav Tlapak 2 years ago, and other deputies before them. In spite of all this the finishing of housing units, except in the north Bohemian kraj, keeps being put off until the last months, weeks and not rarely even days of the year come.

Perhaps it could seem that practically everything is all right. People end up with allocated apartments, after all. Nevertheless, the deputies mentioned another incidental phenomenon of this long-lasting routine as well, namely, the low quality of the completed housing units. Many things left undone, defects, leaks. Exactly according to the old proverb "Haste makes waste." Thus it happens that in some cases it is not always possible to present the housing units to their new users, and the terms of completion are being deferred to the following year. However, this way the construction companies get to be free from any obligation. They have delivered their job, no matter how shabby. And "in time." After all, no state report or statistics cover the fact that sometimes their people do finishing jobs, repairs and improvements even during the whole following year.

Thus nothing else is to be done than to believe that the critical notice presented to deputy Miroslav Mrazek was indeed the last one.

CONCERN FOR ENVIRONMENT INTENSIFIES

Prague RUDE PRAVO in Czech 19 Nov 85 p 1

[Unattributed editorial]

[Text] In the course of the last three 5-year plans, the level of environmental care has become one of the determining factors in the rising standard of living, but in some areas also one of the constraints in the development of productive forces. Through its economic and social impacts, this problem has affected more and more significantly the opinions of the population and has also become more prominent in interstate relations.

One can say that in both the shaping and protection of the environment we have succeeded in many respects, especially during the years of the Seventh 5-Year Plan. Certain environmental goals spelled out at the 16th Congress, however, will not be met. The efforts to secure these goals were not consistent, nor sufficiently sophisticated.

Today's shaping and protection of the environment cannot be achieved without a sophisticated and well thought-out approach to solving our ecological problems. Such an approach is necessary because of the high degree of economic and social development of our society and the dense population living on our restricted territory with limited natural resources, as well as our need to achieve self-sufficiency in food production. All this should be in harmony with the need to maintain our country's ecological stability.

By and large these, but also a number of other factors, were the rationale for the Principles of State Planning for the Protection of the Environment and the Rational Utilization of Natural Resources. This document, which was recently approved by the federal government, follows in the steps of the plans adopted by the two national governments and is the first sophisticated report related to environmental protection in Czechoslovakia. This document received the full support of the presidium of the CPCZ Central Committee.

The main theses of the principles are based on the fact that care for the environment is one of the basic duties of a socialist country and is an integral part of economic and social development. Also, that each and every organization which in any way affects the environment is fully responsible for rectifying all the damage it causes as well as for effectively disposing of or utilizing waste products.

This suggests, among other things, that in the principles of state planning the meaning of the term "environment" is understood in a broad sense. It also includes the problems of waste disposal, foreign substances, agricultural efforts, and the rational use of natural resources as well as the problems of management, scientific-technical and investment policy, and international cooperation. One can say that we are talking about a systematic understanding of the protection of the environment and natural resources based on the improvement of the weakest links of the mutual relationship between nature and society in the economic, administrative, and political spheres. The goal is a gradual harmonization of the ecological, economic, and social aspects for the creation of healthy conditions for the life and work of our people.

The primary aim of the principles is the limitation of the negative impacts of the production processes vis-a-vis the environment, especially in areas with a high concentration of production and mining activity. Consequently, at the federal level we shall primarily be controlling the effectiveness of the measures to improve the quality of air in the two capitals, in the Podkrusnohorska Basin, and in the Ostrava-Karvina industrial region. This, however, does not mean that the other areas requiring necessary care and attention in this respect will be ignored. Those areas will be the responsibility of the two national governments.

Another priority of state planning, besides limiting industrial effluents, is protection of the purity of underground and surface water, the safeguarding of agricultural land, and the preservation of the nature and beauty of our countryside.

Following the evaluation of the existing situation and in accordance with the possibilities of our economy, the above-mentioned principles create prerequisites for reducing the deterioration of our environment during the Eighth 5-Year Plan. This is also the tenor of the A12 state-targeted program, The Formation and Protection of the Environment. This program deals with the implementation of scientific-technical and investment policy in the area of the environment and encourages research and development and production capabilities affecting the improvement of the natural agents of the environment.

We estimate, based on our economy's potential, that the amount of investments earmarked for solving the ecological problems will be Kcs 17.5 billion during the Eighth 5-Year Plan. This is neither an insignificant amount nor a final figure because funds from other social resources will be directed at improving the environment.

How these funds will be spent in the construction of plants to achieve clean air and water or to use or dispose of waste products will be of utmost importance. We can realistically achieve the goals listed in the state plan only if the ecological investments will not remain at the periphery of interests of the individual ministries, economic production units, enterprises, and national committees.

The state program of ecological investments for the Eighth 5-Year Plan is oriented toward the realization of the most important measures aimed at the leading sources of water and air pollution as well as waste disposal. The aim of the investments is to improve the situation in the most greatly affected areas. Hence, for the first time the federal government has classified construction projects aiming to protect the environment as priority projects which cannot be substituted by constructions of other types.

The new state plan also spells out a firm principle that anyone who initiates a new investment project is fully responsible for eliminating its future possible negative effects on the environment. Undoubtedly, this will complicate the life of many investors, even those who are in charge of the most important construction projects needed by our national economy.

For a country with high industrial activity such as ours and even more so if its air quality is affected by the consequences of great industrial activity in neighboring countries, there is no other choice than a planned improvement of its environment. No social goal must be implemented if it disturbs the ecological balance. The tasks which the federal government publicly spelled out in the aforementioned document are politically and economically important affecting the further social and economic development of the republic.

BRIEFS

PRON, CULTURAL COUNCIL CONFER--Jerzy Ozodowski, Sejm vice marshall and vice chairman of the PRON National Council, and Prof. Bogdan Sucholdolski, chairman of the National Council for the Arts discussed forms of cooperation between the PRON National Council and the National Council for the Arts in the development and dissemination of culture, especially the Polish language, on 9 December 1985. [Text] [Warsaw TRYBUNA LUDU in Polish 10 Dec 85 p 2] 13021/12913

HUNGARIAN SOCIAL SECURITY TALKS--In Warsaw, talks between the Social Security Agency and the Hungarian State Social Security Administration concluded with the signing of a cooperative agreement for 1986-88. Ireneusz Sekula, the chairman of the Social Security Agency, and Istvan Bartos, director general of the State Social Security Administration, signed the agreement. [Text] [Warsaw TRYBUNA LUDU in Polish 10 Dec 85 p 2] 13021/12913

KRAKOW FORMS 'ALSO-RAN' CLUB--During a meeting of the Krakow deputies to the Sejm, a proposal was made to form an informal Also-Ran Club to aid the Krakow delegates. The intent is to use the civic experience of the candidates who were not elected. [Text] [Warsaw RZECZPOSPOLITA in Polish 10 Dec 85 p 5] 13021/12913

PRON APPEAL FREES 186 PRISONERS--Continuing their review of cases of persons either accused or convicted for non-criminal offenses, the prosecutors and courts issued another decision concerning the implementation of PRON's humanitarian initiative. As is generally known, PRON appealed for leniency for such persons. As of 9 December 1985 PAP has learned 186 persons, including 22 women had been freed from prison. [Text] [Warsaw ZYCIE WARSZAWY in Polish 10 Dec 85 p 2] 13021/12913

SOCIALIST YOUTH UNION AKTIVS MEET--Three hundred activists of the Union of Socialist Polish Youth from five voivodships are meeting in Spala (Piotrowski Voivodship) for training. They are discussing the most important current tasks of the union and evaluating the implementation of the resolutions of the Fourth Congress of the union. They are also considering the methods and forms of youth participation in the discussion leading up to the 10th Congress of the PZPR. Tadeusz Porebski, member of the Politburo and secretary of the PZPR Central Committee, was the activists' guest. [Text] [Warsaw ZYCIE WARSZAWY in Polish 12 Dec 85 p 2] 13021/12913

ZSL AKTIVS, LECTURERS MEET--A seminar for the central aktiv, lecturers of the ZSL Chief Committee, and the ZSL voivodship committees was held, and Kazimierz Kozuka, member of the Presidium of the ZSL Chief Council, participated. Witold Lipski, a member of the Council of State and editor of "Wies Wspolczesny", delivered a lecture titled "The ZSL in the Interests of the Socialist State, Rural Areas, and Agriculture." [Text] [Warsaw ZYCIE WARSZAWY in Polish 12 Dec 85 p 2] 13021/12913

PRON, KRAKOW STUDENTS MEET--In Kracow-Nowa Huta the students of the Electrical School Group No. 2 met with Jerzy Jaskiernia, general secretary of the PRON National Council and Sejm Deputy. He told the youth about how the Sejm's role and work and mentioned its most important current activities. [Text] [Warsaw ZYCIE WARSZAWY in Polish 12 Dec 85 p 2] 13021/12913

NATIONAL 'ZBoWID' SESSIONS END--ZBoWID's national conference, which included the vice chairmen of the voivodship boards, has ended in Warsaw. During the year, as general Jozef Kaminski president of the national board, noted the union's members participated very actively in the celebrations of the 40th anniversary of the victory over German fascism and Japanese militarism. FRG AGRICULTURE TALKS--Juliusz Solecki, PAP's Bonn correspondent, reports: The signing on Wednesday of the document defining the major forms of future cooperation concluded the visit in the FRG of the delegation from the Ministry of Agriculture, Forestry, and Food Industry headed by Minister Stanislaw Zieba. The delegation, here at the invitation Ignaz Kiechle, minister of food, agriculture, and forests for the FRG, held talks with the leadership of this ministry and toured numerous agricultural and scientific facilities and companies that build good processing and plant protection equipment. Minister Zieba was also received by Lothar Spaeth, premier of Baden-Wuerttemberg state. In an interview with PAP, Minister Zieba noted that the results of the visit are indicative of increased cooperation in the food industry and agriculture between the two countries. The details will be settled by the branch working group for agriculture and the food industry which will hold its first meeting in Bonn 17-21 January 1986. [Text] [Warsaw RZECZPOSPOLITA in Polish 12 Dec 85 p 7] 13021/12913

RESERVE OFFICERS MEET--On 12 December a meeting of the aktiv of the Reserve Officers Clubs of the National Defense League of large industrial plants was held in the Railroad Rolling Stock Repair Shops in Ostrow Wielkopolski. The clubs' task discussed at the meeting is to motivate the reserve officers to participate in the strengthening of the national defense. They also emphasized the need to improve the forms and methods of patriotic and defense education of youth. General Tadeusz Szacilo, first deputy chief of the Main Political Directorate of the Polish Army, and representatives of the Socio-Professional Department of the PZPR Central Committee, the National Board of the National Defense League, and the host voivodship participated in the meeting. [Text] [Warsaw TRYBUNA LUDU in Polish 13 Dec 85 p 2] 13021/12913

MILITARY AGRICULTURAL CADRES--On 12 December in Kazun in the Second Warsaw Engineering Brigade ("General Jerzy Bordzilowski Brygade"), a meeting on the 20th anniversary of the beginning of cooperation between the Main Political Directorate of the Polish Army and Agrochem Enterprise in developing cadres for agriculture was held. More than 100,000 soldiers have taken advantage of the opportunity to improve their qualifications during their basic military service. General Albin Zyto, deputy chief of the Main Political Directorate, and representatives of the Ministry of Agriculture, Forestry, and Food Industry, the National Agricultural Workers' Union, Circles, and Agricultural Organizations participated. [Text] [Warsaw TRYBUNA LUDU in Polish 13 Dec 85 p 5] 13021/12913

VILLAGE COOPERATIVE PLENARY SESSION--Service for agriculture and the rural populace by the rural township cooperatives their unions was discussed at the plenary session of the Council of the Central Union of Cooperatives Peasant Mutual Aid on 12 December. The socio-economic plan for 1986 was reviewed. It includes increasing the effectiveness of action, improving the efficiency of sales, improving product quality, and enlivening the socio-educational and educational-cultural activities. [Text] [Warsaw TRYBUNA LUDU in Polish 13 Dec 85 p 5] 13021/12913

FARM WORKERS FEDERATION MEETS--Two years have passed since the first, founding congress of the Federation of Farm Workers' Unions of the PRL. On this anniversary, a plenary session of its national council was held in Warsaw. The activities of the union members in social agriculture and the most important areas of action in the near future were reviewed. During the past 2 years the federation has added 1,335 new affiliates. In June 1985 it organized 2,800 units, and by the end of the year there will be more than 3,000. There are about 500,000 members. During the meeting of the national council, the federation received a flag donated by the affiliates. A large number of members were given state, ministerial, and union awards honoring them for their civic and professional work. Zbigniew Michalek, secretary of the PZPR Central Committee, in congratulating them emphasized that increasing number of state farms, agriculture producer cooperatives, and circle cooperatives deserve to be called efficient and have achieved outstanding economic and production levels. Jozef Koziol, vice chairman of the ZSL Chief Committee participated in the meeting. Nikolai Ryzhykov (member of the Presidium of the Supreme Council of the RSFSR, chairman of the Union of Professional Agricultural Workers of the USSR) and Rene Digne, secretary general of the International Association of Farm, Forestry and Plantation Workers attended the meeting. [Text] [Warsaw ZYCIE WARSZAWY in Polish 13 Dec 85 p 21] 13021/12913

PRON YOUTH FORUM--On 16 December 1985 the 12th Youth Forum will be held at the PRON National Council headquarters (Aleje Ujazdowskie 13). This time, as suggested by the participants in this discussion group, the topic will be "The German Problem in Young Poles' Consciousness." The following people have indicated they will participate in the youth's discussion: Dr. Mieczyslaw F. Rakowski (Sejm vice marshall), Prof. Lech Janicki (assistant director of the Institute of the Western Territories), Edmund Maclewski (chairman of the Main Board of the Wisla-Odra Society and Sejm deputy), and Subcolonel Dr. Marian

Wojtylowicz of the military Political Academy Social Research Institute. As usual Jerzy Jaskiernia, secretary general of the PRON National Council, invites everyone interested to the Youth Forum. The discussion begins at 15:00. [Text] [Warsaw ZYCIE WARSZAWY in Polish 14-15 Dec 85 p 2] 13021/12913

ZSL HOSTS ARGENTINIAN OFFICIAL--On 13 December Sejm Marshall Roman Malinowski, chairman of the ZSL Chief Committee, received Hipolito Solari Yrigoyena, secretary of the ruling UCR party of Argentina, who is visiting Poland at the invitation of the ZSL Chief Committee. R. Malinowski informed the guest about socio-political and economic situation in Poland and the ZSL's role in solving the country's and society's basic problems. The international situation was discussed. In this context Polish-Argentinian relations and prospects for their development were reviewed. The importance of parliamentary contacts for the development of relations was emphasized. Bogdan Krolewski (member of the Presidium), Jan Czaja, secretary of the Foreign Department of the ZSL Chief Committee), and Romuald Poleszczuk (Director of the Sejm Bureau of International Contacts) participated in the discussion. Ambassador Miguel Dias Szelagowski of Argentina was present. [Text] [Warsaw TRYBUNA LUDU in Polish 14-15 Dec 85 p 2] 13021/12913

PRON HOSTS MEDIA REPS--On 13 December at the PRON National Council there was a meeting of radio, television, and press journalists who write about the movement's activities. Jerzy Jaskiernia, secretary general of the National Council, informed them of PRON's new tasks given the changed political conditions and new social needs. Discussion on the movement's program is continuing. The group of specialists has completed work on the report on the state of national consensus in Poland. This problem will be the subject of the plenary session of the National Council in January 1986. [Text] [Warsaw TRYBUNA LUDU in Polish 14-15 Dec 85 p 2] 13021/12913

AMBASSADOR DEPARTS NORTH KOREA--Kim Ir Sen, president of the Korean People's Republic, received Leon Tomaszewski, the departing ambassador. Discussion touched on Polish-Korean cooperation. President Kim Ir Sen regarded highly the results achieved in relations between the countries and expressed the conviction that we shall continue to develop them actively. [Text] [Warsaw TRYBUNA LUDU in Polish 14-15 Dec 85 p 7] 13021/12913

GDR, POLISH TEXTBOOK WRITERS MEET--On 9-13 December in Berlin the 13th conference of the commission of specialists from the PRL and the GDR charged with improving the contents of school history and geography texts met. The meeting was held to exchange information on problems of education in both countries, especially in history and geography and the ideological and educational significance of their effect on young people. [Text] [Warsaw TRYBUNA LUDU in Polish 14-15 Dec 85 p 7] 13021/12913

TECHNICAL ORGANIZATION TALKS--In Gdansk, the meeting of the Main Council of the Chief Technical Organization has ended. Delegates of the 22 technical associations in the federation attended. The meetings primarily evaluated the nation socioeconomic plan for 1986-90 in science and technology. A resolution on federation activities to develop environmental protection and reclamation was also adopted. The Main Council adapted the program of activities for 1986 and the initial program and organizational premises for the 21st Congress of

Polish Technologists to be held in 1987. The Society for Technological Culture, registered in January 1985 and active since April, was made a member extraordinary of the federation. Delegates to the Sejm Socioeconomic Council were elected at the meeting. Prof. Janusz Szosland, chairman of the Main Council, presided. [Text] [Warsaw TRYBUNA LUDU in Polish 16 Dec 85 p 5] 13021/12913

WRITERS UNION LUBLIN MEETING--The meeting of the Lublin Voivodship section of the Union of Polish Writers was held on 14 December in Lublin. It was the first section meeting. Delegates to the national writers congress to be held during the coming year were elected. Tadeusz Jasinski was again elected chairman of the Lublin section's board. [Text] [Warsaw TRYBUNA LUDU in Polish 16 Dec 85 p 5] 13021/12913

EDUCATION MINISTER VISITS CZECHOSLOVAKIA--On 16 December Benon Miskiewicz, minister of science and higher education completed his visit of several days to Czechoslovakia. During his visit B. Miskiewicz informed his hosts about current problems in party work in higher schools and the adaptation of the program for training graduated according to the needs of the national economy. During visits to several higher schools and discussions with Ludovit Pezlar, secretary of the Central Committee of the Slovak Communist Party, and others the results and prospects of cooperation in education between Poland and Czechoslovakia were evaluated, emphasizing the need to it further. On 16 December Benon Miskiewicz was guest at the Higher School for Agriculture in Nitra. [Text] [Warsaw TRYBUNA LUDU in Polish 17 Dec 85 p 7] 13021/12913

AWARD TO BULGARIAN FRIENDSHIP SOCIETY--The Society for Polish-Bulgarian Friendship, which has existed since 15 December 1918, was given the highest Polish award--the Commander of the Order of Merit of the PRL. The society has cultivated knowledge of Poland and deepened sympathy for Poland in Bulgaria. More than 65 years ago it began an intense publishing effort. Thanks to its efforts the first anthology of Polish poetry published abroad was printed. Many prominent politicians and intellectuals, both of earlier periods and of today, have been among the society's meembers. Wladyslaw Napieraj, ambassador of the PRL, handed the high award to Georgiy Stoilov, chairman of the society's executive board, who was accompanied by several officers and outstanding activists of the organization. [Text] [Warsaw TRYBUNA LUDU in Polish 17 Dec 85 p 7] 13021/12913

ACTORS UNION NEW OFFICERS--The official meeting of the Warsaw Section of the Union of Polish Actors to elected new officers was held in Warsaw. The section elected new officers. Wienczyslaw Glinski (the well-known actor) was selected to lead the delegates. Jan Krzyzanowski was elected chairman of the Qualifications Commission. CROATIAN ARCHIVIST DISCUSSES WARTIME MATERIAL

Zagreb DANAS in Serbo-Croatian 26 Nov 85 pp 24-26

[Interview by Zeljko Kruselj: "Petar Strcic: Are We Renouncing our History"?]

[Text] We have the history of the Zrinskis and the Frankopans, Viceroy Jelacic, Stjepan Radic, and of their times, but we will not have our own history, of us and of today, because there are no documents at all in the archives on the development of post-war socialist Croatia.

The archives of Croatia have approximately 15 kilometers of shelves loaded with authentic archival documents, in which respect Croatia far exceeds Yugoslav norms. Furthermore, one cannot disregard these archives when trying to explain many historical enigmas of the tempestuous and complex history of Yugoslavia.

In spite of its first-rate scholarly, cultural, administrative, and educational value, this institution which is of special social significance still encounters major space, technical, personnel, and financial difficulties; this is partly known to the public. This was the reason for our talk with Petar Strcic, the director of the Archives of Croatia, who is an expert on the 19th and 20th century history of western Croatia. In a lengthy interview, Strcic touched upon some publicly unavoidable instances of politicization of science, which aim to present our recent history in a negative light. He agrees with his colleagues who maintain that the "flood" of controversial books and theses is always a "cyclical" manifestation during times of crisis and major changes in Yugoslav affairs.

[Question] Comrade Strcic, can you explain to us the situation surrounding the acquisition of archival material? In view of the real opportunities, how well are we able to keep with the developed world?

[Answer] As far as the archival skills and other ancillary historical sciences are concerned, our experts are at the level of their foreign colleagues. What is more, Croatian archivists are among the leading in Yugoslavia, and they are also respected abroad. As far as technical capabilities are concerned however, we are the very bottom, not only in the world but also in Yugoslavia. We are at least several decades behind European countries. While the other republics have, for the most part, normal working conditions, the Archives of Croatia have only some small rooms, for example, for the restoration and conservation work and for the photographic studio. It is only now that a major project for the development of these necessary facilities has been approved. Also, recently we have begun, at our own initiative, to use a portable computer that belongs to one of our workers!

[Question] What about the microfilming of material? Today, this is the most reliable means of preserving and using documents the world over.

[Answer] Even though this is a legal stipulation, the Archives of Croatia have thus far encountered virtually no understanding in their attempts to photograph the documents for security purposes. Still, we have photographed tens of millions of meters of material, but that does not cover everything.

[Question] It is known that the Archives of Croatia have great problems with space as well. What are the long-term prospects in this regard?

[Answer] The Archives of Croatia are probably a unique instance in the entire world of having the central archives of a republic dispersed among eight different locations; now, we are preparing the ninth. What if, during these constant moves, there is a traffic accident and originals of inestimable value catch fire and burn? This material is not only a historical treasure, it is also a real one. In Yugoslavia as well, there is a well developed black market in original documents. Some medieval geographic maps, for example, cost over 100 million old dinars each, and we have eight thousand such maps in the Archives of Croatia! Treasures from our archives would arouse more interest in foreign markets than the Mimara collection would. How much do you think the materials of the Commission on War Crimes would fetch--just to have them destroyed?

During the seventies, our community undertook the obligation to erect a building for the Archives of Croatia, a university library, and museums in Split and Zadar. I do not understand why the museums were given priority. The foundations of the new Croatia are to be found in approximately 30,000 sheets published by the Anti-Fascist Council of National Liberation of Croatia. They are to be found in the Archives of Croatia. They are all printed on poor quality wartime paper. The gold objects in Zadar have lasted a thousand years, as have the stone monuments in Split. They could have waited another ten years. The paper in archives, on the other hand, is falling apart. Why were metal and stone given priority? In short, the issue of a new building for the Archives of Croatia cannot be resolved in the near future because of financial reasons.

[Question] Does this mean that the Archives of Croatia are not accepting documents from the post-war period?

[Answer] They are not accepting them because there is no room. As far as the future is concerned, we will have to be satisfied with what certain republic institutions and organizations are unprofessionally saving in their own Archives. In addition to the Archives of Croatia, the regional archives in Split and Zagreb are in an exceptionally difficult position.

[Question] Does this mean that presently there is no archive where the documents of some important organs of our republic could be preserved and studied?

[Answer] That is what it means, and this is something that is unique in the world. It could happen that we will have no written proof for a good portion of our history. We are trying to change this situation radically, because otherwise crucial parts of the history of our times will be based, for the most part, on press articles, memoirs, etc.

[Question] What would this mean from a scholarly/historical and cultural/educational point of view?

[Answer] It would be a crime toward the Croatian and Serbian nationalities and the national minorities in Croatia. There is no other name for it, because it is a well-known fact that what is not written down or preserved in some other fashion simply does not exist. We have the history of the Zrinskis and the Frankopans, of Viceroy Jelacic, of Stjepan Radic, and of their times. On the other hand, we will not have our own history, of our own times. For the most part, we will depend on memoirs and other types of secondary literature. In other words, there will be no scientifically based history of socialism in Croatia. We do, of course, have an idea where the most important documents are, because we keep track of the owners, but no one can guarantee that the material will not be destroyed.

[Question] Your colleague Vojmir Kljakovic has recently noted that Yugoslav historians have an incredibly passive attitude regarding penetrations by foreign scholars writing about Yugoslav topics, and also regarding statements made by our historians in other countries. How true is that?

[Answer] Not only are the historians passive, but the politicians, who are paid to monitor these things, are also passive. Consequently this is not only a scholarly problem, but above all a political one. For example, our historiography will never write as much about Istria, the Croatian Littoral, and Dalmatia as has been published in Italy, because we do not have as much money. A second problem is the fact that we do not translate even the most important works of our historiography into world languages. On the other hand, look at what the Bulgarians are doing in regard to Macedonia. Not a single important political or scholarly meeting takes place without the world-wide distribution of anti-Macedonian, and therefore also anti-Yugoslav, publications.

[Question] Closely connected with this is also the issue of the teaching of history in the schools and universities. It has been a long time since we have heard a historian voice even partial satisfaction over this.

[Answer] How could he! We are the only sovereign country in the world that permits a negative influence on the formation of the historical awareness of its young people. Such an awareness is developed through a systematic education at home and training provided by the society. Every state on the face of the earth somehow manages to indoctrinate its younger generation. We, on the other hand, permit such indoctrination to be performed chaotically, or even by proven enemies of our society! It is known that the interest in history most frequently manifests itself between the ages of 16 and 20, mostly among the males of the population. It is especially people of those ages that are taught the least amount of history in the schools. Instead of sound history, we have introduced a Marxist "catechism" which contains some history. Because of its mumbo-jumbo, it is at present the most hated subject in school. There should be a Marxist outlook to all the school subjects, and one should not have to be a "grind" who is interested only in the grade he gets. Darkness is setting in!

[Question] How can one explain and make up for the lack of some primary sources on the wartime period of our history. Recently, the press article which stated that some of the archives from Jasenovac, Kerestinec, Gradiska, etc. were thrown in the garbage dump came as a real shocker.

[Answer] Those were not archives from those death camps. The articles said that because the authors had scant historical knowledge. If by some chance there were archives from Jasenovac, it would be a unique case in the world. Complete archives from a concentration camp were never and nowhere found. On the contrary, everybody involved in mass crimes has tried to destroy such archives, so that there would be no written evidence of the crimes.

What happened? During the cleaning of the attics of two buildings belonging to the Zagreb medical school, approximately 10 glass plates with photographs ended up in the trash. We accepted this material and preserved it. It was immediately assumed that these were depictions of innocent victims. One should know, however, that the Ustasas themselves got even with each other in those camps. The only person in the photographs that we were able to identify was none other than Jurcic, the head of the Ustasa secret police, whose throat was slit after the Vokic-Lorkovic Ustasa putsch against Pavelic was discovered. Jurcic was certainly no innocent victim, which is what a part of the press told the public. In any event, the criminal Jurcic would have been shot after the liberation, as was his successor Lisak. The truth about these pictures was not told even after the case was explained in the Zagreb press and before the Council. On the contrary, a Belgrade newspaper has claimed for the third time that these "archives" were thrown away by the Archives of Croatia! Imagine such a lie: the republic Archives of Croatia throw away evidence of Ustasa crimes during the so-called Independent state of Croatia! It seems that they think that we archivists are insane. I have no other comment for the time being, unless this persistent and repeated peddling of lies is not something more serious, such as a deliberate attempt to incite the public ...

[Question] Still, do these plates have any historical significance?

[Answer] Of course they do, but certainly not for the preservation of revolutionary traditions; at least, not those bearing the likeness of the criminal Jurcic.

[Question] How do you explain the polemics of many years duration and the excitement especially in regard to the problems of the historical interpretation of Jasenovac and Kerestinec?

[Answer] Regarding Jasenovac, it is clear that the desire is to incite chauvinistic hatred, and there is no concern for the victims. For your information. I am an islander from Krk, and my feet are firmly planted on the ground. For that reason, my old proposal is a practical one. Why should not there be. in the area of Jasenovac, excavations done as part of youth work actions, including primarily medical and dental students from all of Yugoslavia? Bones and teeth do not decay, and thus it would be possible to arrive at a more accurate estimate of the number of victims. Judging from the most recent findings, the approximate number could be larger than that established by the official commission after the war. And before the war, who bothered, for example, to count all our Romes, for example?

The Kerestinec situation is somewhat different. Here, certain individuals are creating confusion because their consciences bother them. It is clear that some of them have failed, and the result is the destruction of a major portion of Croatia's intellectual patrimony. Tragedies like the one in Kerestinec, however, also happened elsewhere.

The case of Kerestinec is constantly being dragged out, because it deals with certain relations, as for example with the Komintern, and for that reason the problems are deliberately being exaggerated. Since similar doubts regarding the Party and the revolution in Croatia appear on a cyclical basis, one is forced to ask himself whether someone from the outside is directing all the confusion?

[Question] This brings us to the relationship between science and politics. It is certainly indisputable that politics is somehow interested in participating in the resolution of certain historical questions having a broad social significance.

[Answer] Here, one could paraphrase the idea that history is in reality the servant of politics. This is true of the totalitarian regimes. In Yugoslavia, however, this could not be the case. After the war, we had so many powerful historians who would not have permitted this. Who could force people like Grga Novak, Dragoslav Jankovic, Jaroslav Sidak, or Bogo Grafenauer to write against their convictions? It would be absurd even to consider this. We were fortunate because that old, honorable generation was strong, and it acquired a world-wide reputation and established the foundations of our historiography.

Today, there is no Yugoslav historian who is recognized as an authority worldwide. The problem has arisen with the second generation of historians, the group between the ages of 40 or 50 to which I too belong; we are used to the telephone, the television, the refrigerator, central heating, the automobile, and other blessings and "values" of the contemporary standard of living. Because of personal comfort, some of us are following the line of least resistance, and creating confusion in historiography. Most of them are doing this for financial, not political reasons. A book which "exposes" something, "pokes around" the entrails of the revolution, and causes condemnations and polemics is many times "profitable" than one which discusses the same problems in a calm and well documented manner.

There is something else here. On certain occasions, historians can help the politicians. On the other hand, leaving aside the matter of ensuring financial rewards, politicians really cannot help the historians. The events surrounding Djuretic's book prove that historians can help politicians a great deal. Even though that book scandalized the public and provoked the sharpest possible political condemnations, the historians are being very slow and coy about reviewing Djuretic's book in a negative light. Why? Certainly not because they support the rehabilitation of the Cetniks. This is certainly more than anything a matter of abusing the historian's profession. The historians had nothing to do with this. In other words, eminent scholars did not approve Djuretic's and similar books. Now, they are expected to deal energetically with other people's omissions which are mostly political in nature.

[Question] Speaking of historiographic enigmas, are there items in the Archives of Croatia that are not accessible to the eye of the historian, for either political or technical reasons?

[Answer] There are not. And why should there be? In accordance with the law, as director I refuse to grant access to the material only if I establish that the person requesting it is mentally disturbed. Furthermore, when I ask people why they are requesting certain documents, mostly from the time of war, I discover more and more frequently that they intend to do harm to somebody by distorting the contents of the documents. In such cases, I direct the person in question to the appeals process. It is interesting that thus far none of these "questionable" inquirers has filed an appeal.

[Question] Do the controversial books, to so-called "quarrel books," prove or disprove the existence of tabu topics in our recent history?

[Answer] These books only prove that their authors are not capable of being scholarly historians. When they are unable to solve a problem, they say that they are not allowed to write about it, or that they could not obtain the documents from the archives. I have personally ascertained that some, who had claimed not to have been able to obtain the material, had never requested it. This is easy to verify, because all users are required to sign the register, and there are no exceptions to this. These same so-called historians are saying that they were able to get all the more recent documents from English, German, or other foreign archives. It is natural that they were able to obtain information on Yugoslavia or, for that matter, on the Ivory Coast. Why should foreign archivists be concerned about this? Our "scholars," however, would have encountered quite a wall had they tried to obtain recent documents dealing with the country whose archives they were in.

[Question] How do you explain the fact that the present and the future of our society are nowadays viewed primarily through the past, in which is found "the root of all evil"?

[Answer] As far as human mentality is concerned, the times have not changed since antiquity. When the Roman empire was in a crisis, gladiator games were organized. The saying "bread and games" has remained valid to this day. In our crisis situations, we have pleasant events like Lepa Brena or unpleasant ones like Zjajo. There certainly are serious reasons. In a short period of time, everything imaginable has befallen Yugoslavia. First of all, we were hit with a major economic crisis, caused not only by the multinational companies but also by our own stupidity. Secondly, in a very short period of time persons who had achieved a great deal left the scene; they had been instrumental in creating a long, peaceful period after the war, and we had behaved as if they would be around forever, and we would just have to enjoy things. In short, we did not assume in time the responsibility for our own development. I also believe that certain foreign interests have woven their webs around us, and individuals not favorable to us have begun to make themselves heard. Some are like Dedijer, and are doing this for their own personal reasons, others, like Terzic, because of wounded vanity, while others still, like Kopinic, in order to pacify their own consciences. Also, some remnants of our enemies are clearly still around.

[Question] What, then, was the "scenario" of the introduction of confusion and "bad feelings" into our historiography?

[Answer] The present trends have begun as early as 20 years ago. They began by striking against relations between the nationalities, which is the easiest; Serbs against Croatians, Serbs against Albanians. In Serbia, the first to raise suspicions against certain nationalities and national minorities was Terzic; in Croatia it was Tudjman; and in Kosovo, Ali Hadri. This is roughly how it began. It was followed by Dedijer's attack against the very head of our community, Comrade Tito; naturally, Dedijer did this after Tito was gone. Then came Kopinic's attack against Koncar and others. We historians reacted sharply and en masse, but the books had appeared. There has also been an uncritical attempt to publish the work of the reactionary historian Slobodan Jovanovic, who, among other things, has been sentenced by a Yugoslav court. That was the purpose of Djuretic's book and of Petrovic's article in Knjizevne Novine. This was not enough, and the statement was made that foreign Hungarian fascist occupiers had played a positive role in Yugoslavia. Bela Teleki was the one to make this claim. This is almost the limit. And what will be the limit? In all probability, it will be the discovery that in reality, Germany had not occupied Yugoslavia. This is the only thing left to do to finally close the "black ring."

DELIVERIES OF EC 1026 COMPUTERS DISCUSSED

Prague VYBER INFORMACI in Czech No 3, 1985 pp 291-296

[Article by Bohumil Kubik, Office Equipment, Prague: "Deliveries of EC 1026 Computers"]

[Text] The EC 1026 computer system is a modernized version of the EC 1025 which has been in production since 1981. Because both systems have been described in the professional literature, we will refer only to their basic parameters and will focus instead on the problems experienced with the completion of peripheral devices, particularly disk storage units and terminals, i.e., equipment which is a limiting factor when the effective utilization of these systems is needed.

Both computers were developed by the Research Institute for Mathematical Machines in Prague, and they are a logical follow-up to the earlier EC 1021 system. They differ from it by belonging to the JSEP (Uniform System of Electronic Computers) Phase II type, having multiprogram capability, and having a 512 kB working memory with the ability to reach virtual addresses totaling up to 16 MB for each user. Their modular structure makes it possible to directly connect internal memories to the modules and transfer channels. The maximum capacity of internal disk storage is 400 MB. The communications module makes it possible to connect up to 16 synchronous lines, which allows for local and long-distance communications via alphanumeric terminals with other computers. Both types are supported by a highly effective disk-oriented DOS-3/EC operating system. These technical and program features make these computers suitable mainly for the automated control systems of enterprises and smaller economic production units.

The differences between the EC 1025 and EC 1026 lie mainly in the higher operating speed, energy efficiency and greater reliability of the working memory. It must be noted, however, that gradual innovation was such that the parameters characteristic of the new system were already present in all the EC 1025 computers since v.r. [possibly manufacturing year] 013.

Completion of the EC 1026 system by peripheral devices

In view of the need for impartial responsibility for the functional and operational reliability of an entire system, the principle of completion by the manufacturer is one that has always been maintained. These regulations, together with full functional delivery of the entire computer unit before it actually left the manufacturing plant, meant that supply and service organizations, as well as final users, could have a basic certainty that the equipment would operate properly because everything delivered had been functionally tested in its full computer configuration, up to and including the version of the basic programs.

For various reasons, however, it has recently been necessary to reassess these views and in some cases to deal with the completion of systems in a different manner. So far, this has been the case mostly for the magnetic disk storage units from Bulgaria, for terminal systems, and to some extent for EC 7039 printers.

Internal Memories

100 MB disk storage units

Except for a working model and two prototypes, the EC 1025/26 computers were completed by adding Bulgarian large capacity EC 5066 disk subsystems which were delivered in the following configuration: the EC 5667 control electronic recorder with two EC 5067.02 disk drives. Each EC 5067.02 unit contained two independent spindles for compiling 100 MB disk sets. The basic disadvantage of these memories was their low degree of operational reliability, manifested by frequent failures during which one or more floating heads and the established media were destroyed.

Despite these repeated disadvantages, it was necessary to continue to use these storage devices even though the disk module of the EC 1025/26 computers makes it technically feasible to attach other disk units, such as the American Memorex drive, used by the aforementioned prototypes and the working model, or the Soviet EC 5066 100 MB units. The completion of our manufacturing products by memories imported from NSZ [possibly nonsocialist countries] was not possible. Consideration was given to the use of the Soviet EC 5066, but that created too many problems, mainly because of the ongoing shortage of these memories on the domestic market. In the USSR, most of the production is intended for the completion of the EC 1045 computers, which are intended for the export market, while units for domestic sale use drive units imported from Bulgaria. Even a more rapid completion of the development and initial manufacturing of the Czechoslovak A 4080 100 MB disk storage units manufactured by the Aritma enterprise would be no instant solution, however, because even here we encounter a number of problems, mostly with the effort to manufacture heads.

Therefore, the only possible solution was to rapidly determine the main possible causes of the unreliability of the Bulgarian drives, hold meetings with representatives of the manufacturing plant in Stara Zagora, and exert pressure on the Bulgarian supplier to gradually eliminate these deficiencies. For this reason, two independent expert evaluations were conducted, one at the VUMS [Research Institute for Mathematical Machines] in Prague and the other at the Construction Department of the CVUT [Czech Technical University], using other specialized centers within the CVUT framework.

After several meetings, the Bulgarian manufacturer took certain steps to improve the operation of the disk storage units:

-- improvement of the control of the servosystem by making changes in plates 14 and 27;

-- changes in the closing system of the top lid;

-- increasing the density of the filters, which results inter alia in higher subpressure;

-- a new brake system for the spindles was introduced, using eddy currents;

-- extension of the startup procedure and improvement of output control.

These changes, in conjunction with regular checking of the environmental parameters, gasket condition, measuring the subpressure, and cleaning and testing the disk sets, will significantly increase the reliability of this system.

It is therefore necessary to count on future deliveries of the EC 5067.02 disk drive units from Bulgaria.

In order to increase production capabilities by doubling some equipment, since 1985 we have been ensuring the deliveries of individual EC 5067.02 units. A new aspect of the EC 1025/26 is the ability to increase the capacity of disk storage to up to a total of 800 MB on the basis of the upgraded design by engineer Helena Kvasilova of VUMS (Research Institute for Mathematical Machines) in Prague.

29 MB disk storage units

The EC 5061 29 MB disks from Bulgaria can be attached to the computer using the electronics of a disk module. This arrangement is already set up in the cables and it can be achieved by fitting 11 boards which can be ordered as a "bloc for extending the DSK module" for the purpose of attaching small disks. The delivery lag is approximately 15 months from the time of an order placed by the 31st of December. The disk units are delivered in 3-piece sets and a maximum of six units can be attached.

Tape memory

Ever since the manufacture of the EC 1025/26 began, the EC 5004 156 kB magnetic disk memories with double-density recording, manufactured by the Tesla Concern in Pardubice, have been available. The deliveries of EC 5004 can be counted on for the EC 1027 computer as well. The reliability of these storage devices, according to Tesla Pardubice, lies within the 500-hour average time confidence limit between failures. In recent years, the manufacturer has met all demand, and this trend is expected to continue.

Input and Output Devices

Peripheral input and output devices are usually attached using a standard interface of the JSEP type (uniform system of electronic computers) to the multiplex module (byte-multiplex channel). Altogether, a maximum of 10 control units can be attached. The exception to this is the console equipment, which can be attached to the service module. How easily obtainable these peripheral equipments are is shown in Table 1, which represents a realistic configuration of the EC 1026 computer at present.

The range of available peripherals has not changed for quite some time. One noteworthy development is the ending of the manufacture of the EC 6016 punchcard collector, and its replacement by a small reader, the EC 6012. This represents an acceleration of the move away from using the punchcard as a major data medium to the more modern data base using floppy disks. The EC 7902 punchcard unit is a similar case; its manufacturer has already announced the end of production in 1985. Another new development in this area is the EC 7240 type electrostatic speed printer being prepared for manufacture by the ZPA Kosire [Plant for Industrial Automation] enterprise, Jinonice branch. The printer is supposed to have 160 characters per line, 1,000 lines per minute speed, measures 700 x 540 x 325 [mm?], and weighs 75 kilograms. The output medium is dielectric paper P54/83. The preliminary price is Kcs 250,000 and the printer will be available by 1987.

Data Transfer Equipment

For data transfer, the EC 1025 and EC 1026 computers are equipped with a communications module (KOM) which serves as a multiplexer for data transfer. KOM has 16 synchronous lines to which equipment can be attached by means of modems. The data transfer is synchronous in the BSC protocol. The transfer codes are KOI 7, ASCII, DKOI. The transfer speed of all simultaneously working KOM lines can be a maximum of 96 kbits/sec. In some cases it is possible to do a so-called null modem connection to the terminal (EC 7915) using a special cable. The terminal must have the requisite synchronization frequency for this transfer. The speed here is limited by the maximum transfer speed of the KOM line and the length of the cable used. Considering the availability and quality of communications lines, a transfer speed of 1200 baud is most commonly used. For a local data transfer up to a maximum of 1,200 meters, it is possible to use the multiplex module, to which a control unit of the EC 7920-01 local terminal subsystem can be attached.

End equipment attachable to the KOM EC 1026

The technical means of the terminal systems basically make it possible for a larger number of operators to work with the computer at the installation site as well as at more remote work stations. Generally, these systems can be used for collection and processing of data, for conversation with the computer using the question and answer system, or as adjoining operator working station. Most of the end equipment available in Czechoslovakia is subsystems of the EC 7920 type terminal system. The following is available for the EC 1025 and EC 1026 computers:

-- EC 7920-01, a local group subsystem;

-- EC 7920-11, a remote group subsystem;

-- EC 7920-21, an independent remote subsystem;

-- EC 7915, an independent remote subsystem.

The EC 7920-01 local group subsystem

The subsystem is made up of the EC 7922-01 control unit, EC 7927-01 screen displays, EC 0101-1 keyboards, light pens and EC 7934-01 dot matrix printers.

The subsystem, imported from the USSR, has the basic configuration of one EC 7922-01, four EC 7927-01s, four EC 0101-1s, and two EC 7934-01s; the RJ EC 7922-01 is connected to the multiplex module (MEX) and is capable of a transfer speed of 200 kB/s.

The EC 7920-11 remote group subsystem

The technical parameters of this subsystem are identical to those of the EC 7920-01 subsystem. The only exception is a control unit labeled in the 7920-11 subsystem as the EC 7921-01.

The control unit can be attached to the KOM via modems and commuted or fixed telephone lines and is capable of a transfer speed of 4800 kbits/second. This subsystem is also imported from the USSR, for the most part with the EC 1045 computer configuration. Last year it was delivered to several users of the EC 1026 and, because of unsolved problems with the differences between the OS-6 and DOS-3 operating systems, further imports for EC 1025/26 computers were halted. However, imports should resume in 1986.

The EC 7920-21 independent remote subsystem

This subsystem consists of EC 7925-01 screen displays with control electronics, EC 0101-1-04 keyboards, and possibly EC 7934-02 printers. It is connected to the KOM via a synchronous modem and telecommunications line. The transfer speed is dependent mainly on the quality of the line used and, under ideal conditions, it reaches 9600 baud. As of yet, the equipment has not been manufactured in volume because of the shortage of production capacities, but working models have been run in national and international testing of the EC 1027 computer. This subsystem is replaced by importation of the EC 7915.

The EC 7915 independent remote subsystem

This subsystem consists of a screen display with a microprocessor based keyboard, and the DZM 180 printer or ROBOTRON 5211 printer can be attached to it. It is imported from Poland under the name META 7950. It is attached to the computer using modems with the CCIT V.24 interface for long-distance transfer or via a null modem using a multiwire cable for local applications. The maximum tested distance for the local transfer using null modem communication to the KOM is 1,300 meters at a speed of 9600 baud. In 1984, users of EC 1025s received 100 units of these terminals without printers. In 1985, deliveries of terminals with printers, and of printers only for the previously delivered terminals, are being considered.

Equipment for emulation of terminal subsystems

To cope with the difficulty of satisfying users' needs by imports of terminal subsystems, emulations of the EC 7920-11 or EC 7920-21 subsystems by the SMEP computer and PE 7920 program are being prepared. In this case, the SMEP computer functions as the control unit of the terminal subsystem, having the same technical functions, and it behaves outwardly as a dumb terminal. The advantage of this solution lies mainly in the replacement of the EC 7927 and CM 7202 displays, which are difficult to obtain. The disadvantage is that the emulator cannot replace all the functions of the terminal subsystem even though the collection and preprocessing of data, writing of programs and conversation are possible. A further disadvantage is the difficulty in obtaining the EC 7202 display.

In the course of the international testing of the EC 1027 computer, there was an unofficial exhibition of communications between EC 1027 and an emulated EC 7920 system on the basis of the ADT 4500.1/2. The availability of this equipment is assumed by 1986-87.

Additional Prepared or Available End Equipment

EC 8576 communications terminal

This terminal is the top line model for devices for data collection onto a floppy disk. Data is input using keyboards and optical controls on the displays. The recording on the floppy disks can also be checked by a program. The terminal has a memory of 32 kB or 48 kB and the C 2111.01 printer.

In a data preparation system, this terminal has the function of the C 2712 nonportable workstation with printer. In the free program system, it makes it possible to introduce a translator and a translation with error indication. The finished program or data can be transferred using MDS 1200 S2 modems and telephone lines, at a speed of 1200 or 600 baud. The transfer is of the synchronous semiduplex type. A limited number of EC 9114s is ensured for the completion of EC 1026 computers in 1985.

IT 10 smart terminal

This unit consists of the portable M3T 300.1 computer, to which, using adapters, the basic peripherals can be attached. Data transfer using modems and telephone lines in the BSC protocol to the EC 1025 through EC 1027 computers is supported by the KOKUO conversation communication program.

Basic parameters:

-- 16-bit microprogram processor

-- working memory of 24 kbytes

-- display unit with 256 characters

-- contactless keyboard

-- magnetic card memory (1 card 2 x 512 kbytes).

Changeable adapters:

-- DP FS 1503 or FS 751 A/M reader

-- DP DT 105.S or R 1215 puncher

-- DZM 180 or C 2111 printers

-- M3T memory with flexible disk

-- IMS 2 collectors

-- synchronous or asynchronous data transfer on the CCITT V.24 or IRPS interface

-- time generator.

Availability: Immediate deliveries.

IT 20 (M3T 320) smart terminal

Functionally connects to the IT 10.

Preliminary technical parameters:

-- 16-bit microprogram controlled processor

-- system of instructions similar to the ADT line

-- working memory of 64kB, EPROM 64 kB

-- display unit for 1,920 characters

-- contactless keyboard

-- cassette tape memory of 150 kB per cassette.

Changeable adapters make it possible to connect the peripherals of the IT 10 system and the R 1152, 1156, 1157 printers, the CM 7202 display and the BAK 5 T recorder.

Deliveries of this terminal are expected to begin in 1986.

Table 1

JSEP type	Name of equipment	Attached to	Availability	Maximum attached
79Mi	Alphanumeric operator display	SRM	Mandatory equipment	1
EC 7934	Console dot printer	SRM	Mandatory equipment	1
EC 0101	Contactless keyboard	SRM	Mandatory equipment	1
EC 5074	Floppy disk drive	SRM	Mandatory equipment	2
EC 6112	Portable card reader	SRM	Good	1
EC 5075	Disk input/output unit	MPX	Good	n
EC 7092	Punchcard unit	MPX	15 months	n
EC 7039	Chain line printer	MPX	Limited. Maximum of 2 computer units +++	n
EC 7054 M	Drawing table	MPX	Very limited	n
EC 5667	Electronics for control of recording	DSK	Mandatory equipment. 1 unit	1
EC 5067.02	Disk memory 2x100 MB	EC 5667	Mandatory equipment. 2 units. +	2

LONG-TERM ELECTRONIZATION VIEWED

Prague VYBER INFORMACI in Czech No 3, 1985 pp 309-313

[Text] In Resolutions Nos 3/1983 and 32/1984 of the Presidium of the Czechoslovak Government, it was decided to set up a national program of electronization of the Czechoslovak national economy. The program was based on sectoral electronization projects for six selected key sectors (Federal Ministry of Metallurgy and Heavy Machine Industries, Federal Ministry of General Machine Industries, Federal Ministry of Electrotechnical Industry, Federal Ministry of Communications, Federal Ministry of Transportation and Federal Ministry of Agriculture and Nutrition). The program includes the material and technical efforts to ensure not only the development of electronization, but also its application, during the years of the Eighth and Ninth Five-Year Plans (1986-1995). The implications of this program are reflected in State Goal Programs (SCPs), particularly A 07, Material and Technical Basis for Electronization, and A 08, Prevailing Applications of Electronics. At the present time, this complex long-term electronization program is already being moved forward on the basis of Decision No 253/1984 of the Government of the CSSR, mainly by the fulfillment of the tasis of both of the above-stated State Goal Programs.

Material and Technical Basis for Electronization

This State Goal Program is composed of two main parts (subprograms): the first covers the spare parts base and technological equipment (subject 372, semiconducting components; subject 373, microelectronic integrated circuits; and part of subject 516, a special equipment for electronics) and the second consists of technical means for control and automation (subject 403, equipment for data processing; and subject 405, equipment for automated regulation and control).

Inclusion of these subjects into the new A 07 State Goal Program (SCP) is supported by the experiences gained in the course of fulfilling the State Goal Program during the years of the Seventh 5-Year Plan. The targeted production volume of the electrotechnical industry will be achieved in full when this industry will, during the Eighth 5-Year Plan, be developing as proposed in the approach for this area, i.e., Federal Ministry of Electrotechnical industry. This is also true as regards the other fields and manufacturing areas, such as high efficiency converters, pneumatic components, special electric drives, equipment for information transfer, cables and conductors. The main goals and intentions of the new approach under this State Goal Program are as follows:

-- to better meet the needs of the national economy by making structural changes within the Czechoslovak electrotechnical industry and by further extending international cooperation with the USSR and other countries in the Council for Mutual Economic Assistance;

-- to better the usable value of products, and to improve the evaluation of raw materials and energy needed for their manufacture, particularly by speeding up technical innovations;

-- to increase work productivity by a factor of about 3 by 1995 in the area of electrotechnology, mostly by significantly increasing current manufacturing capacities and volumes for one-purpose technical equipment (to 10 to 15 times the present levels);

-- during the years of the Eighth 5-Year Plan, to achieve a significant decrease in prices of mostly electronic parts, to a third of the 1983 level, and thereby significantly reduce the prices of final electronic products.

The demands placed on technical development in the electronic fields result from the need to innovate a broad range of parts; within the 3- to 5-year cycle of innovations, this demands that several thousand production and technological tasks find solutions. It is largely a question of developing microelectronic components with a high degree of integration, of developments in progressive technology and slected technological equipment, significantly increasing work productivity in the production and testing of working parts, and increasing their reliability and service life. Complex computer technology will be used in designing, manufacturing and testing new semiconducting parts. The key technologies are the following:

-- isoplanary and I^3L in the area of bipolar integrated circuits;

-- the CMOS, HMOS II and NMOS technologies for unipolar circuits with high integration density;

-- integrated circuits using gallium arsenide;

-- working parts of optico-electric transmission systems.

Successful results lie within reach of the researchers working for the Tesla Electronic Parts Enterprise in Roznov, the A.S. Popov Institute Tesla VUST [Research Institute for Communications Technology] in Prague, and the VUMA Research-Production unit in Nove Mesto nad Vahom. Their work concerns mainly automation for the assembly of electrotechnical products, measuring and testing technology, research and development of laser technology equipment, and industrial lasers for use in microelectronics.

The second part of the A 07 Goal Program is made up of technical means for control and automation, an area where the prospective product range continues to be based on the nomenclature equipment for the JSEP (Basic Electronic Computer System) and SMEP (Small Electronic Computer System). In the category of medium and large computer systems, the EC 1027 system will be supplied and developed in the following manner:

System	EC 1027-4	EC 1027-8	EC 1027-12
Initial year of production	1985	1985	1988
Working memory in MB	2	2-4	4-16
Speed (thousand operations per second)	350-400	700-800	1600

In the category of minicomputer systems, the SM 52 system will be supplied and developed as follows:

System	SM 52/11	SM 52/12
Byte length (bits)	16	32
Working memory (MB)	0.256-2	2
Speed (thousand operations per second)	700	1300

The SM 50 microcomputer systems are being developed in an 8-bit version (on the basis of the equivalent of the INTEL 8080) and in a 16-bit version (on the basis of the INTEL 8086). When needed for quicker and more efficient applications, these will be carried out on the basis of two to four-bit cross-sections with the equivalent of the INTEL 3000 and AMD 2900 microprocessors. A uniform base for microprocessor parts makes it possible to use common program equipment. In developing these microcomputer systems, there will be space left for the user so that they can be improved upon, as users will have at their disposal all that is needed--technical means as well as developmental systems--for program writing, as well as microprocessors.

The development of the production of peripheral equipment focuses on the complex program of internal magnetic storage, the screen program including graphic terminals, as well as printing devices (chain, electrostatic and dot matrix) and the equipment for graphic input and output, digitizers, digigraphs, tabloids and graphics stations.

The main goal for further development of basic and functional program equipment is to decrease the distance between the computer system and its user in such a way that the user can utilize the system without having to go through the specialized programmer. That will decrease the demands on the compiling of data and will slow down the growth of the number of specialists operating the computer systems.

In the case of control and automation technology, research, development and production will be focused on means for obtaining information from the control center (readers for industrial operation facilities, sensors and readers for heat pumps). There will also be a focus on means for processing and storing information and on the connection between the control center and the operator. It will involve the entire network of transfers of input and output signals for centralized systems as well as decentralized systems, but also systems for laboratory, telemetric, and telemechanical uses. Also covered are systems with increased reliability, such as communications and control units with reserves, a chosing unit with autodiagnosis, microcomputer control and regulation units, industrial transmission collecting units for decentralized control systems having a hierarchical structure, spark safety systems, systems for the utilization of information that would affect the controlled unit, as well as rotary, lever and draw power drives based on the new power drive and power drives used in robotics up to the efficiency of 300 watts.

The control systems for production machines will be made uniform in terms of size as well as function while improving them technically, making it possible to successfully export machines and equipment. This will entail the development of a basic generation of microelectronic systems for the control of other types of machines, as well as making structure and systems uniform while utilizing domestic materials and components (including imports from member countries of the Council for Mutual Economic Assistance), which would make the process of manufacturing control systems as well as machines and equipment in the final manufacturing process more economical.

Within the framework of this State Goal Program (A 07), suggestions based on the tasks of the State Plan for Technical Development have already been prepared.

Let us highlight the main ones:

Prospective higher generation computer system research (third generation interactive systems, SMEP computer systems, hierarchical control systems, and distributed systems for the control of technological processes).

Development of components of the JSEP multiprocessor computer system (basic elements and junctions based on block fields, new peripheral equipment which can be used for present as well as new computer systems, as well as a universal DOS 5/EC operating system with a transfer possibility to the higher OS/EC systems).

Development of the JSEP multiprocessor computer system (with the efficiency of 2.5 Mbyte/s, block fields type).

Automation of projection and construction works (a complex of methods and devices for the automation of projection as it relates to the production process, functionally structured distribution systems with an emphasis on interactive graphics using Czechoslovak parts and production bases).

Automation mechanisms for ASRTP [ASR = automated control system] (this involves the design of control systems, technology and construction, means for obtaining information, means for processing information and the connection of the operator with the process and the system, as well as the means for utilization of the information and application methods).

Development of modules for technology automation systems (technological, assembly and testing modules which would increase productivity by at least 50 percent).

Technology for training facilities for the VVER 1000 MW nuclear power plants (here, the importance lies not just in the training facility itself, but in how well the facility is equipped in terms of programs for the training of personnel working in the first Czechoslovak 1000 MW nuclear power plant in Temelin).

Research and development of control systems for manufacturing machines (improving the technological standard of the systems for machine tool units and other machines and equipment, their system unification, placing special importance on savings of foreign exchange, savings of material, energy and labor, while increasing work productivity. Simultaneously with the solving of these tasks of the State Plan for Technical Development, those groups of products and technological equipment which leave no room for modern microprocessor technology should be gradually phased out. Groups in which the opposite is true will be used in the development of fields which are contained in the A 07 state program).

Pioneer Application of Electronics

This State Goal Program is the result of a long-term complex program of electronization of the Czechoslovak national economy, and is divided into seven pioneering application areas.

1. Control of technological production processes (continuous and interrupted): ability for control modification, the development of control algorithms, a component of operation systems and hardware structures, easy upgrade to higher control systems, the increase of the ability to transfer the application program equipment to other control systems. By 1990, individual areas are supposed to be finished with 2,490 systems.

In addition to the development in significant individual fields of machine and metallurgy production, the control system for mining transportation in the Darkov mine, the safety control for a nuclear power plant, a gas works system, a farm for second generation milk cows with an automated control of technological lines, automated data collection and processing using a computer, dispatching equipment in the construction industry, systems for the control and regulation of growth conditions for timber in the timber industry, hydrometeorology and water purification, the control of hydrothermic processes in the chemical and consumer industry, and the control of the manufacture of chemical fibers using the newly developed technologies, are among the more interesting control systems.

2. The control of nonmanufacturing processes in individual nonmanufacturing fields should by 1990 include 2,890 systems. Here we are talking about the systems for the automated control of trains, the automation of grade crossings, railway safety equipment, telephone exchanges, electricity wire placements in large cities, television using satellite signals; in the area of the control of city transportation systems: Czechoslovak bus transportation, ticket reservation and sale, weather reports on road conditions; in the area of finance: the control of teller operations in banks, a terminal net for banks and credit

unions in connection with a central office; in the business area: marketing systems using samples, and hotel and restaurant reservations; in the educational field: systems for lesson control, specialized learning centers and laboratories; in health services: systems for control of the diagnosis, healing and nursing processes, and in hospitals and health clinics, the control of registers of massive noninfectious diseases; in the area of geodesy and cartography: control systems for data input and output on microfiches, a dialogue method for formation of geodetic centers, automatic registration of measured data; in the housing economy: the automation of measuring, regulation and billing systems for the use of warm water inside apartment buildings as well as individual houses; in the meteorological area: a cybernetic information system for control and periodic checking of the quality of the atmosphere and hydrosphere.

3. The automation of construction, planning and program projects. Here, each individual area is supposed to be finished by 1995, with 395 systems.

This will involve projection systems in electrotechnology, microelectronic circuits, the automation of high integration circuits for customers and partial customers, draft documentation in metallurgy and the machine tool industry, the establishment of Czechoslovak-Soviet CAD/CAM work centering on the machine tool industry, as well as CAD/CAM on a single theme in certain complementary fields (bearings, rotary and flange-mounted parts, robots, etc.; certain types of projects which use computer graphics and the management of certain types of construction projects).

4. The automation of machines, instruments and equipment. This area is also a large program, including 6,050 systems by 1990. Among the areas involved, for example, will be systems to automate telephone exchanges, medical instruments, laboratory systems, equipment for the clinical environment; automation of industrial furnaces, locomotives, rolling stock, foundries, diagnostics, train systems, drying facilities, CNC systems, machines and equipment for various fields and areas of industrial manufacturing; in the fuel and energy field, it is automation of surface mining equipment in accordance with the safety systems in the mining industry; in other fields, it is automated measuring systems, control and diagnostic systems for mechanical textile machines, and interactive technological and design complexes.

5. The control of organizations. In this area, by 1990 the central authorities with a general role and central authorities with specialized roles are supposed to introduce a large number of automated control systems (ASR P, automatic control system for enterprises; ASR SC, automated control system for centralized control units).

The interesting systems in this area are, among others, local networks for the automation of production and nonproduction activities, distributed commercial dialogue system based on local networks using SMEP, system of pioneer and application programs of personal computers, the utilization of computer technology in view of long-term automation, electronization and robotization.

6. Products and equipment for personal uses. In this area, a 1990 target of a certain number of units was established. For example, 1,215,000 nonportable and 200,000 portable color television sets, 40,300 video recorders, 400,000 digital turntables, 1,840,000 personal computers, 1,632,000 new generation radios, 500,000 automobile radios, 23,500 tape decks and 40,000 CD players.

In the machine consumer products industry, innovation will affect 30 percent of the production of electric ranges and electronic programmers will be applied in heat storage stoves, innovation will affect 30 to 50 percent of refrigerators and freezers by using optical and sound signals and the mode control, while there will be 5-10 percent automation of automatic washers using a programmer, and the installation of wash temperature controls in 50 percent of washers.

Industrial enterprises of the Ministry of Industry of the Czech Socialist Republic and the Ministry of Industry of the Slovak Socialist Republic should be manufacturing electronic musical instruments, furniture and electronic furniture systems, toys and electronic sports equipment, valued at Kcs 150 million.

In the cultural area, innovation will affect analog records, magnetic tapes, digital records and video tapes.

The manufacturing cooperatives will increase the value of electronic products to up to Kcs 45-50 million per year (electronic musical toys and musical instruments).

7. The technological basis for the production of electronic systems applies exclusively to the FMEP (Federal Ministry for the Electrotechnical Industry), where by 1990 some 5,000 technological systems will be manufactured, as well as measuring and testing devices and equipment for diagnosis, and specialized equipment to increase the volume of production of merchandise at the VHJ ZAVT (Economic Production Unit and Automation and Computer Technology Plant).

It is assumed that each organization, production enterprise, plant, research institute and service organization will be working to implement this demanding program in several stages. The first stage (preparatory) should deal with the training of leading workers and working out the actual electronization program; the second stage should ensure the material, technical, personnel and organizational conditions required to make this program a success; while the third stage is that of actual application of the program, whether by using their own means or other types of application systems.

All organizations of production and research work centers have at their disposal specialized business and technological organizations such as Tesla Eltos, Office Equipment and Data Systems, which ensure, in addition to training and preparation of workers with individual specializations, the supply of materials and means of computer technology, including programs, documentation and concrete applications. At the present time, the discussion is no longer whether we should or have to electronize, or why and where to do so; instead, the main emphasis is placed on how to electronize. These tasks are also not to be understood in a technocratic way as a matter only for computer technology and microelectronics, because this entire problem requires a suitable social climate, and it must be looked upon as a program where the main tasks in the future will be adjusted in such a way as to fulfill a strategic goal, namely the qualitative change of the production forces in our society.

SOCIOLOGY YUGOSLAVIA

INFLUENCE OF RELIGION AMONG ALBANIANS IN KOSOVO

Belgrade BORBA in Serbo-Croatian 14-15 Dec 85 p 10

[Article by Mirko Mlakar: "Religion in Troubled Waters"]

[Text] It is understandable why every piece on Kosovo gives inter-nationality relations first priority. But the people are not just Serbs, Montenegrins, Albanians or Turks...there are also Moslims, Serbian Orthodox Catholics, Roman Catholics, atheists, and a few Baptists and Adventists. The Kosovo dailies write very little about this because there are not enough journalists qualified to continuously "cover" the social questions of religion. What's more, religion in Kosovo, like many other sociological so-called phenomena, is not a field of systematic study of any of our scholars.

The majority of Albanians are Moslims, as far as we know there are no Serbian Orthodox Albanians in Yugoslavia, but there are parts of Kosovo where Roman Catholicism is very evident. Such is the case in Binac, in the Vitina opstina, where there are virtually no Moslim Albanians. (By the way, there are also two Catholic parishes in that community.) Mohammedans often do not acknowledge Catholics as "true" Albanians. Previously, it was easy to tell them apart by their last names. For example, the Albanians who early on embraced Christianity converted to Islam with the arrival of the Turks, thus their first and last names became Turkish-Arabic (i.e., Emin or Mehmet), with only a few of them holding on to their old names (Pieter or Djon). Today this is relatively important, even though, for example, the Shirokas continue to be predominantly Catholic. In remote areas, differences can still be noted in dress and general life style. If we were to generalize, Moslims to a greater extent are engaged in pastry-making, and Catholics will filigree jewelry and similar crafts.

The others' souls are watched over by the 20 Albanian priests who fall under the Skopje-Prizren bishopric. For 16 years they have been publishing the religious-cultural review "Drita." In addition to the 112 issues published to date, this journal also does something for the younger generation; because religious literature is scarce (the New Testament, etc.), they are working on enriching it, by translations, etc., a similar predicament to what the Moslims are going through.

It seems that the Roman Catholic Church is the most imaginative in finding efficient ways to interact with its believers: it successfully organizes excursions, athletic and cultural-social life, and free time in general, in particular that of the young. But in this Church as well, even though it is known for its monolithic ways, there are differences among the clergy. Thus in Janjevo and Prelepnica, tension can be noticed between the priests who pronounce the rites in Albanian and those who "receive" in Serbo-Croatian.

Prizren Crossing

The Supreme Authority of the Islamic religious community for the Socialist Republic (SR) of Serbia is found in the capital of the Province. The highest mufti religious district (muftijstvo) (a mufti is roughly comparable to a bishop in christianity) is in Pristina, which also oversees five more councils of the Islamic community (Titova Mitrovica, Srbica, Glogovac, Podujevo, and Lipljan), and this includes over 100 mosques. The fact that two thirds of the 100 imams are poorly qualified (this situation also exists in other areas, not just in Kosovo), is addressed by the Alaudin medrese (Moslim religious high school); in this Pristina high school there are over 150 students. In addition, out of five Islamic papers in Yugoslavia, only one is in Albanian - "Edukate Islami."

Prizren is where Roman Catholicism, Serbian Orthodoxy and Islam most often meet. The seat of the Raska-Prizren bishop Pavao is in this city, as well as the Serbian Orthodox theological seminary (theological high school). The Islamic community oversees 21 mosques (no longer intended solely for the use of Pasha Sinan), and the council maintains 36 mosques and mescits (small mosques) from the surrounding villages. There are also a few tekkes (Moslem monasteries) in Prizren.

It could be said that in the Croatian, Serbian or Moslim case, the rule applies that no nationalism exists without clerico-nationalism. Thus, while we could say that the plans of the Croatian nationalists have to coincide with the petty-political designs of the irreconcilable right-wing of Catholicism, the "marriage" of Albanian nationalism with Islam is almost nonexistent. When H. Haimef Hadjiabdic, Reicul-Ulema, the supreme Islamic leader in Yugoslavia, met with President of the Commission for Relations with the Religious Communities, of the Executive Council of the Assembly of the Socialist Autonomus Republic (SAP) of Kosovo, Refik Agaj, they concluded that relations between the Islamic and socialist communities were good, and no intractable problems existed. That Agaj's words were not merely protocol, is substantiated by the fact that not a single imam, teacher or student at the medrece participated in the 1981 demonstrations. Not only did they not fall in with the counter-revolutionaries, but they contributed to attempts to resolve the "complicated situation."

Hoxha, the Temporal God

This cannot be dismissed as just faithfully following mohammed's instructions (among other reasons because love of one's homeland, tolerance and similar messages are found in other faiths); but taking everything into consideration, the fact is that if anything, the nationalist organizers based their activities upon the ideology of Enver Hohxa. In other words, every sincere irredentist is attempting to work for the annexation of Kosovo into Albania, which, as a true Stalinist country, has proclaimed itself the "first atheist state." Put simply, Hoxha and his successors have elevated themselves to the level of temporal and divine gods. There is no room for other gods under his regime, and the only religion not persecuted is the intoxicated cult of a "Great Albania!" This is where Albanian nationalists meet, and it looks like they will meet (when their ideological face, that is mask, is finally completely uncovered) with increasingly insurmountable difficulties. This is to say that the majority of Albanians are religious, and they will not happily exchange entry to a Greater Albanian false paradise for a rejection of their cherished faith.

The Albanians connect religion, which does not suit the irredenta either, with other Yugoslav nations and nationalities. But, there is another side to the coin. Specifically, the nationalities which make up the majority of the Islamic religious-cultural circle are in fact the most closed off, which brings up the fact that they could become even more so. Or, what does it mean when an Albanian Catholic enters into marriage with a Croat or a Slovene, but will not with a neighboring Serb, just because she is not of his religious persuation?

Consequently, the great degree of religious freedom in Yugoslavia, combined with the intolerance of irredentist entities toward anything religious, make it clear that any religious official who supports the insidious "annexation" of part of our country to Albania would in fact be working against himself and the interests of those of his faith. But this is no way implies that clergymen never work for "nationalist concerns." Just as there exist fundamentalists ("the Young Moslems") who support the idea of a religiously and ethnically "Pure Bosnia-Herzegovina," similar phenomena can be found in the Province. With this in mind, the intensity of the construction quarrels along the lines of: "If the Serbs (Serbian Orthodox Catholics) build a new church in Klokot, we'll build two mosques in the neighborhood - let them see who is boss here," is indicative.

Saudi "Concern"

Pressure on non-Albanian Moslems, known in the SR Macedonia as Banians, has been noted in western parts of Macedonia. The Supreme authority for the Islamic religious community for the SR Macedonia, the journal "Preporod" writes, "claims with satisfaction that not one religious official in its jurisdiction was involved in the hostile demonstrations, or in Albanian irredentism or nationalism, but, they say that these occurances have had certain repercussions within its jurisdiction."

Along the way, individual foreign journals present the suppression of Albanian nationalism as an *attack against Islam. To what extent this disinformation* goes can be shown with an example from "Ed-D'ava el-Islamija," a weekly published in Riyadh (Saudi Arabia). In a lengthy article entitled, "The Communists Reap a Moslem Harvest in Yugoslavia" (issue from 22 Sha'ban 1403 according to the hegira calendar, or 1 August 1983) which among other things states that in 1981 the Kosovo Moslems were seeking their civil rights, and that the Party sent tanks into the streets and killed thousands of Moslems! This respected paper's "accuracy" guarantees the statements that during Bajram 12,000 Moslems were murdered in the Great Mosque in Foca, more than 6,000 were slaughtered on the Gorazde bridge, still more in Macedonia, and on and on with similar lies.

In our "religious wars" people do not suffer - their remains do, specifically the Moslem clergy could stand to be a little more vocal in taking a stand against the barbaric acts occurring over graves or the vandalism to sacred objects in Serbian Orthodox churches. It has been noticed that, for maximum negative effect, the desecrators of the graves destroy the monuments on the eve of mass visits to cemetaries.

National divisions have been transmitted to religious relations: on the one hand Serbs and Montenegrins (mainly baptized Serbian Orthodox Catholics) and on the other hand Albanian (Moslems and baptized Roman Catholic "factions") continue in "troubled waters," or in the words of one report, "objective problems and weaknesses in the struggle for a stabilized situation are being misused." Those controlling the situation have noticed that some arms of the Serbian Orthodox Church have attempted to put themselves in partnerships with socio-political forces, and that this has resulted in an elevation of the Church to the position of a real legitimate representative of the interest of the imperiled Serbs and Montenegrins.

In the existing atmosphere in Kosovo, everything receives a different significance and higher specific weight. Thus, funerals have become less of a religious rite and more of a nationalist assembly which have significantly more non-religious people attending than before the counter-revolutionary demonstrations. In the same way games in the church-yard have grown into gatherings (not only of believers) of Serbs and Montenegrins. Or, when the Patriarch German and his Moscow colleagues Pimen and Gracanici arrived in Kosovo, 10,000 people greeted them. If it had been in healthier times, there certainly would not have been so many. In Belgrade, for example, the patriarchs were greeted by fewer than a thousand people.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

NEW FINANCING, TAX SYSTEM FOR FARMS APPROVED

Budapest FIGYELO in Hungarian No 47, 21 Nov 85 p 13

[Article by Mrs Aniko Nagy-Javorszky: "I Give Some, I Take Some"]

[Text] The income situation of agricultural enterprises has continuously deteriorated during the 1980s. The share withheld by the state steadily increased, and by 1984 it amounted to 17 billion forints. This necessitated the re-examination of the agricultural enterprises' operating conditions. The Council of Ministers has already accepted the new system of regulations which will come into effect in 1986.

Reduced Support

Until now, agricultural enterprises received financial support under three categories: in accordance with their investments, in order to increase their production, and for the purpose of obtaining production equipment. 70 percent of this support was for the increase of production; this figure was followed by the amount earmarked for the purchase of industrially manufactured production equipment. The least amount was devoted to enhance investments.

The amount of support gradually decreased: While in 1976 it covered 30 percent, in 1984 it paid for only 9 percent of investments. For example, the support of constructions was reduced by 49 percent, the subsidizing of machinery has been eliminated, and the amount of other types of support was increased by 9 percent.

In contrast to the support of investments, the amounts earmarked for the enhancement of production have more than doubled since 1976. Within this category, the enterprises operating under unfavorable conditions received 20 percent of the production support in 1976, and 28 percent in 1984.

Production support amounted to 7.4 percent of the gross production in the cooperatives, and 5.4 percent in the state farms. However, while the cooperatives' proportion has increased since 1976, the state farms' share decreased during the same period. The same trend can be observed in the proportion of the enterprises' achievements as well. In 1976 the amount of support per hectare of cropland and per employee doubled the amount given to the cooperatives. By 1984, however, the level of support received by the cooperatives significantly approached the state farms' level.

Pretexts of Taxation

In order to complete the picture, it should be pointed out that the support money earmarked for the purchase of manufactured capital equipment in fact ends up not in the hands of the producers but in those of the merchandising firms. In spite of this, this money is legally recorded under the category of assistance extended to agriculture. In a peculiar manner, while other types of subsidies and state withholdings apply only to the large agricultural enterprises, even the small producers are considered when it comes to indirect support.

Due to the withholding or reduction of indirect support, the cost of capital equipment has increased by 60 percent between 1976 and 1985. Support for purchasing small agricultural machinery has become insignificant, and that for pesticides has been reduced by 77 percent. On the other hand, the purchase of articial fertilizers received 31 percent more support. But this 31 percent increase did not balance out the 39 percent increase in the price of fertilizers, even though in 1984 the subsidies for fertilizer purchases made up 76 percent of all indirect support.

As for the amount withheld by the state, in 1984 agricultural enterprises paid taxes under the following pretexts: contribution to urban and community development; taxes on incomes and profits; taxes on the basis of income regulation and health insurance; production, construction, and building equipment taxes; taxes on the volume of sales and on real estate owned. In addition, they had to pay differential sales taxes, commercial taxes, one-time fees for the use of real estate, investment fees, and there were occasionally other non-normative budgetary requirements as well.

In 1976 withholdings equalled 13 percent, and in 1984, 15 percent of gross income, that is, one and a half and two times the amount of production results, respectively. In the case of the state farms, the amount of withholding per hectare of cropland, or per employee, was much higher as early as 1976, but especially in 1984, than the amount withheld from the cooperatives. State farms, whose cultivating practices are more intensive, paid 63 percent more taxes per hectare of cropland and 30 percent more per employee than the cooperatives.

Between 1976 and 1984 the total amount of withholding increased by two and a half times: somewhat more in the case of state farms, somewhat less in the case of cooperatives. Among the reasons it should be mentioned that, for example, since 1976 income taxes have doubled, while the tax base, gross income, has only increased by 79 percent. The amount of national health insurance contribution increased by three and a half times, while the figure upon which it is based, the amount of wages, grew by only 79 percent. Since 1976, the amount of insurance premiums was continuously higher than the amount paid out by the insurers, even in years of drought, hailstorms or floods.

It must be admitted that taxes on land have increased by only an insignificant amount, even though the area of arable land has decreased since 1976. Production taxes tripled, but income from auxiliary activities has also increased at a similar rate.

Sizeable Banking Costs

Among the various withholding items, the greatest growth--a 12-fold increase--was experienced by taxes connected with income regulations. (Until 1983, contribution to wage-development, income-growth, honorarium, and share taxes, and beginning with 1984 progressive profit, honorarium and share taxes.) In addition to this great increase, construction and building-equipment taxes grew four and a half-fold, and sales taxes two and a half-fold. Banking costs are more than two and a half times what they used to be.

In 1976 and 1984 alike, the largest withholding items were the profit taxes and the premiums on the national health insurance. In 1984 their combined total nearly amounted to half of the total withholdings. These proportions were identical in the case of state farms and cooperatives, but not the production taxes! In 1984 this amounted to 17 percent of the total withholdings in the cooperatives, but only 9 percent in the state farms. The explanation: State farms were more involved in food-processing activities, which enjoy tax-free status. On the other hand, their banking expenses are sizeable, representing 20 percent of their withholdings. This is due to the fact that state farms have larger parks of specific capital equipment, and a higher specific proportion of outstanding investment credits, while their larger holdings of current equipment are also burdened by more debt.

During the period between 1976 and 1985 agricultural enterprises operated under increasingly difficult conditions. The price of machinery, chemicals and energy supplies increased at a higher rate than the production cost of agricultural goods.

Changing Balance

During the nine years in question, the amount of support grew by 24 percent, while the total of budgetary and other withholdings increased two and a half-fold. In 1976 there were still 5.5 billion forints more in support than in withholdings. (However, if we do not take the indirect support enjoyed by the merchandising enterprises into consideration, the balance was already negative.) In contrast to this, last year the amount of withholdings exceeded that of support by 17 billion forints.

Agricultural enterprises attempted to make up for these burdens by increasing their participation in non-agricultural activities which are less equipment-demanding and at the same time bring more certain and quicker profits. They became more economy-minded in their handling of manufactured material and reduced their investments. The number of equipment items depreciated to zero has grown significantly.

The profits of agricultural enterprises grew by 79 percent between 1976 and 1985. However, the amount of profits pro-rated into costs was 11 fillers in 1976, and 1984 it was only 9 fillers, which indicates an 18 percent decrease.

Table I: The investment support extended to agricultural enterprises (in million forints)*

	1976	1984	1984 (%) 1976=100
Construction	2,113	1,137	53.8
Machinery	3,325	21	0.6

HUNGARY CONSIDERED AS ECONOMIC REFORM MODEL FOR USSR

Bonn EUROPA-ARCHIV in German No 4, 1984 pp 111-118

/Article by George Schoepflin, lecturer in East European Institutions, London School of Economics and at school of Slavonic and East European studies, London University: "The Capacity for Reform in Soviet Systems: Is Hungary a Model?"/

/Text/ One of the most stubborn myths of the seventies and eighties, diligently propagated by the Western press and abetted by the Budapest regime, is the myth of a liberal communist reform system in Hungary.

It is interesting enough to speculate as to why the West--both the media and public opinion (not to mention governments and financial circles)--feels the need to believe in the existence of at least one East European nation whose situation may be characterized as "reasonable" and "acceptable." The solution to this enigma may possibly be buried in some Western credo, e.g., guilt in the face of the West's inability to do anything about the continuing submission of Eastern Europe to the Soviet Union or belief in detente, based either on the desire for peace or simply on ignorance or the wish to be dazzled by the glitter of the Budapest boutiques. It is worth noting that Hungary is not the first country to benefit from this Western gullibility. For some time, Romania was the darling of the West until President Ceausescu succeeded in irreparably destroying the image of his country in the West. In the sixties, it was Czechoslovakia on which the West was about to pin its highest hopes. In the early seventies, Poland was in fashion for a brief period of time; but Gierek's failure put an end to that soon enough. There were even some who warmed up to the GDR--but those were the exception, i.e., people with authoritarian leanings or socialists who place a higher value on faith than on experience. Perhaps one day the time will come when this part will be assigned to Bulgaria or even Albania. There seem to be no limits to the spread of this pastime because it is based on a need to believe.

But in reality Hungary is entirely different from what these people would like it to be. To be sure, there are the bright lights and the elegant shops along Vaci utca and its environs; certainly there are traffic jams in Budapest and the food shops are filled with goods. But behind that facade there is a far more complex Hungarian reality and that reality is of immediate concern as we try to answer the following two questions: whether the Hungarian political system is (a) a communist reform system in the true sense of the word and (b) whether it may serve as a model for other Soviet-type systems.

Definition of Soviet-type System

First of all, we need to define the Soviet-type system. For the purposes of this article it may suffice to describe the major characteristics of such a system as follows: a closely knit political elite which is organized as a party (but in reality has nothing in common with political parties as we know them in the West) and whose primary goal is to concentrate power in their own hands--without permitting any other social organizations to function. This goal of holding on to power is of greater importance than legitimacy, social justice, performance, capital formation and economic rationality. Whenever the party's claim to absolute power has been threatened, it has responded with coercive measures without regard to the consequences.[1]

Below this elite, a partial modernization process has taken place--or at least the first stage of one. But insofar as it was successful, this process, too, amounted to a distortion of the needs and wants of the societies of Eastern Europe: since these countries had already gone the way of modernization prior to the communist takeover at least some of them were forced to regress to simpler, premodern conditions as a consequence of the power monopoly exercised by the communists. This was most evident in the case of Czechoslovakia which clearly went backward; but it also applies to a lesser degree to Hungary. In the pivotal areas of modernization, e.g., complexity, change and free choice, the Soviet-type systems have made very little headway.

Since the end of the Stalinist era, there has been a fundamental transformation in East European politics. Prior to de-Stalinization, the communist parties insisted on monolithic control which amounted to a virtual claim to control of all activities and initiatives of government and society; but subsequently the parties allowed certain unofficial, incipient and not yet institutionalized activities to take place outside their control which meant that the "leadership role of the party" did not include an unlimited monopoly over all activities and initiatives and that there might thus be some conflicts of interest (of a "nonantagonistic" nature) even in Soviet-type systems. There were some important consequences for Eastern Europe which arose from this new definition of the monopoly role. The individual was granted a great deal more freedom of choice, particularly with regard to economic issues. It led to a "de-ideologization" of major areas of intellectual life (e.g., since the one and only, all-encompassing Marxist-Leninist rationality no longer applied, there was nothing to prevent the use of Western technical rationality as for instance in the construction of bridges). This, in turn, provided the party with enough room to maneuver so as to redefine the kind of loyalty it expected of the intelligentsia along more liberal lines. On this basis, the majority of the intelligentsia--particularly the technical intelligentsia could be co-opted--a process which became known as the "changeover from Red to expert."[2]

This process also required the party to redefine its claim to legitimacy. While party rule during the Stalin era was justified in the name of the perfect, utopian society being built, legitimacy was justified in the name of the party's claim to the "monopoly of rationality and efficiency" once the period of de-Stalinization began. In all those cases where that claim did not turn out to be justified in practice, a healthy dose of nationalism was added.

Under normal conditions, i.e., if the party was not under too heavy pressure, this system worked well enough to guarantee a certain stability. But whenever party control grew weaker for one reason or another, it soon became apparent how narrow the base of party rule really was and that a large part of the population hoped for a radical change in power relationships in the direction of greater popular participation and a drastic reduction in the party's monopoly role. The past 30 years have also provided clarity regarding two other issues. One is that the popular goal of democratization remains unattainable as long as the Soviets and their satraps in East Europe remain resolved to prevent it. If there is one area in which these regimes continue to demonstrate a certain efficiency, then it is in their exercise of power, including coercion. Time and again, power has been displayed and used to shore up a Soviet-type system and to preserve its monopoly position to the greatest possible extent. But secondly, insofar as these societies have changed and have grown more complex, it has become more and more apparent that the absence of an institutionalized expression of interests; the generally prevailing informality; the continued power vacuum (resulting from the concentration of power) and the adherence to party hegemony vis-a-vis all comers throughout society--that all this has led to a political debacle which will be very difficult to repair.[3]

Kadar's Achievement

Viewed in this general context, Hungary has demonstrated relatively few signs of decay and has thus been earning special praise as /the/ country with a properly functioning Soviet-type system. The responsibility for it is largely ascribed to the slyness of the Hungarian leader, Janos Kadar, and his admirers quite openly speak of the Kadar model and of "Kadarization." The use of that particular term is doubtful at best, if it is meant to imply that it is a consciously applied reform strategy based on a clearly defined political program. The fact is that the Kadar regime's achievements are the result of a number of ad hoc measures, of experimentation guided by the vague desire to preserve a certain measure of popularity or to avoid the lack of popularity from which Kadar's predecessors in the early fifties suffered. In reality, the so-called Kadar model has passed through various stages of openness and isolation. But all throughout it was characterized by the leadership's lack of resolve as it tried to do justice to conflicting interests exemplified by the Soviet Union, its own party hardliners, the various economic and geographic interest groups and, in the final analysis, also by public opinion. The authentic Kadar style was in evidence only as regards the caution and empathy vis-a-vis the public with which the various shifts and maneuvers were carried out. This was the key element in the Kadar regime's exercise of power. Just as it has taken a very flexible approach to promoting its own point of view vis-a-vis Western journalis-s, it has with few exceptions demonstrated great skill in dealing with public opinion inside Hungary whenever political measures (e.g., price increases) were in the offing. As important as these questions of style may be--and one should not underestimate them--style still cannot substitute for policy. There have been instances in which greater weight was attached to the facade of "liberal" policies, e.g., in dealing with the opposition, than to actual substance.[4]

The mainstays of the Kadar system may be divided into four categories. First of all, there are the close ties to the Soviet Union; the readiness always to accept limitations prescribed by Moscow and conformity with the Soviet Union regarding all major issues of foreign policy. Secondly, there is the restriction of the party's power as a result of the failed revolution of 1956. That event and its aftershocks have left their mark both on Hungarian society and the party. In the late fifties, the population was once again terrorized and subjected to systematic pressure against the strong aspirations toward autonomy which had been aroused during the revolution. When its membership plummeted from 900,000 to 30,000 between September and December 1956, the party was faced by total destruction. The rebuilding of the party and the re-establishment of its position of power was tantamount to a renewed communist takeover. It was the third time (since 1919 and 1948) that the communists went through this experience. The upshot of all these developments is that certain unstated limits have been accepted as regards the exercise of power by the party and that the party makes an effort to proceed cautiously and to look for at least a minimum of popular support. Thus, a kind of unwritten agreement was reached the central feature of which is that both the party and the people have entered a basic commitment to support the Hungarian state even though both sides still cling to their different idea of what constitutes "Hungarian identity."

In some respects, the third factor has been the most important of all. Following the second stage of de-Stalinization in the late sixties, the Hungarian party came to the realization that its monolithic structure could no longer be reconciled with the requirements of modern society. Conflicts of interest were allowed to arise as long as they were not institutionalized. This caused some confusion for a time but it did offer the various competing social groups an opportunity to articulate their specific interests. But at the same time, the power of party was not severely affected by this. The secret of this system is that it asks of all the political participants that they exercise a certain measure of understanding and tolerance. What also contributed to the success of this system was its fourth pillar: the personal role played by Kadar himself. It has turned out that he is neither an egotist with megalomaniacal plans (such as Ceausescu or Gierek), nor a tyrant (such as Enver Hoxha), nor still a weak presidential figurehead (like Husak) but has tried to act like a cross between a first among equals and a humane father figure. His ranking position inside the party apparatus is not questioned although he has not been exercising it in a particularly dictatorial fashion. But when he throws his weight behind a change in policy, that change is accepted. This continuing accumulation of authority on Kadar's part has resulted in giving the system a personal cast. And that means that there is no way of institutionalizing his views and political practices--which would be difficult under any circumstances--and that the Kadar system will undergo profound change once he leaves the scene. This feature of the Kadar system became apparent during the course of the little-known events in 1972. At that time, Kadar, it seems, was just about ready to quit and did not reconsider his decision until his as yet unpublicized step caused the outbreak of a sharp struggle among the different cliques inside the party. One of the consequences of these events was recentralization of functions. One also had to look back in dismay at the lost years in the course which additional changes might have been instituted in the middle and late seventies.

The Party and the Social Groups

From the point of view of Hungarian society, the system is based on a variety of agreements with all of the major social groups. The intelligentsia was integrated into the system by virtue of the fact that the concept of political loyalty is not being interpreted as rigidly as in the fifties and that it has been given access to the outer circles of power and to material benefits. The system has worked well up to now and the Hungarians do not tire of pointing out that any alternative to their policies could only be worse. In view of the 1956 and post-1956 trauma, this attitude can easily be understood. The result was the emergence of a kind of "negative legitimacy" which permits the intelligentsia to criticize conditions within the limitations prescribed by the party and the party, for its part, was sensible enough to err on the side of permissiveness so as not to risk dissatisfaction. Paradoxically, this has created a situation where the intellectuals support the system as the "least undesirable" alternative.

In the workers' case, the agreement is somewhat different in the sense that it focuses primarily on economic issues. The party has accepted the premise that the workers have a right to a steadily rising standard of living--or at least one that is not drastically lowered; also, to social benefits, to full employment and the freedom from drudgery. At the same time, certain categories of workers are accorded preferential tratment without regard to their actual contribution to the economy, i.e., in reality without regard to the principle of equality which still is (at least now and again) part and parcel of official ideology. It is fairly certain that about one-fourth to one-fifth of the population lives below the poverty line.

Through the application of a flexible and successful system which has brought farm income in line with industrial earnings, the farmers have assumed the role of supplier of basic foodstuffs on behalf of the regime.[5] Once again, it is worthwhile to point to the nature of the system which is characterized by ad hoc decisions and informal acts. Nothing has been institutionalized and, within broadly defined parameters, everything can be rescinded. The party has made concessions but not granted rights which could be appealed in a court of law. Conversely, the political cost of taking back any of these concessions could turn out to be too high. When restrictions on the private plots of the farmers were announced in 1975 with a view to reducing their high income, a large number of farmers immediately stopped production altogether and threatened to cut off food supplies to the cities. The restrictions were hurriedly withdrawn.

The Success of the System

The success has become apparent in four specific areas. The matter of style has already been referred to. The way in which the party has conducted its relations with society; the care it has taken to adhere to formal procedures; the differentiation between political offenses and political mistakes and the relatively strong measures taken to combat corruption have all helped to preserve stability. This latter point is particularly noteworthy, since the regime was thereby able to avoid spectacular failures such as marred Gierek's years in power. Agricultural policy is generally viewed as a major success--and rightly so. This has been due partly to good luck and partly to good management. Ever since the mid-sixties, the party has accepted the fact that agriculture is part of the political landscape because this sector of the economy was collectivized and thus occupied its rightful place under socialism (as opposed to Polish agriculture). Under the circumstances, it was possible to demand greater investments in agriculture and a fairly effective agricultural lobby managed to make them stick. At the same time, the conditions under which the collectives had to operate were made more flexible than in industry so that enterprising managers of agricultural collectives were in a position to increase production. Equally, the members of the agricultural collectives were quietly permitted to work their private plots and even to use the collectives' equipment for that purpose. The limits on investments in private agriculture were sufficiently flexible to enable farmers to achieve high yields in foodstuffs and to sell them on free markets in the cities. This explains why Budapest is always well supplied with food at a time when other communist capitals regularly experience shortages.[6]

The third success story concerns the secondary economy tolerated by the party and the attempts to integrate some of the secondary activities into the primary (socialist) sector.[7] This has led to a number of consequences. It has provided the cities with a more or less adequate level of services which is something the socialist sector never manages to achieve for lack of flexibility, as is well known. It has directed the entrepreneurial talents and energies of a large part of the population toward self-enrichment (as opposed to political undertakings) and has provided the population with a cushion which helped soften the shock of the economic downturn of the late seventies and thus substantially expanded economic decisionmaking possibilities. But like so many things in Hungary, this free zone available to the secondary economy is unofficial and not institutionalized. For another thing, it results in additional inequities, since the different segments of the population do not have equal access to the secondary economy and their opportunities to profit from it are therefore not the same. It is particularly aggravating for the party that some of its most faithful adherents--the workers in heavy industry--come out worst in this system, since they do not have the necessary marketable skills and are therefore less than happy about the situation. It needs to be pointed out, however, that the smooth operation of the secondary economy cannot be celebrated as a triumph of party strategy. It did not develop the way it did on the basis of a conscious decision by the party but rather as a result of the recognition that it would be politically and economically unwise to place restrictions on it. This means that the party quietly accepted the fact that inequities could arise; that the officially proclaimed collective ethos was thereby jeopardized and--what is perhaps the worst of it--that two contrasting value systems now exist side by side: a private and a public one.[8]

Finally, the list of successes would also include the debate on reforms in 1982-83, which could be described as the most farreaching, officially sanctioned debate of its kind in any Soviet-type system since the "Prague Spring." In several of the contributions to this debate, the very nature of these systems was subjected to radical analysis and correspondingly radical proposals for change were submitted.[9]

At first glance, this looks like proof of the flexibility of the Hungarian party; but in fact it was merely a reaction to the imminent collapse of the country in 1982 and it is symptomatic of the real state of affairs that the debate achieved very few concrete results. Only the new election procedures could be considered a direct outgrowth of the debate. Since August-September 1983, far more orthodox statements have become the rule. Deputy Minister of Culture Deszo Toth has expressly warned of the dangers of overstepping the new boundaries outlined by the party.[10]

The applicability of the lessons learned from the Kadar system to other Soviet-type countries is therefore far more difficult than is generally thought. Too many of the positive aspects of this system are attributable to Hungarian peculiarities and the specific political management skills of the leadership under Kadar to transfer them to some other situation.[11] At best, the Kadar system might serve as an example for the fact that a Soviet system must not necessarily adhere to rigid, restrictive criteria but can be led with intelligence so as to achieve a certain measure of stability and popular approval. In this sense, "kadarized" Hungary might serve as a possible alternative and a sign of hope for reformers; but only a few of the present institutions are suitable for transfer to other countries. In every other East European nation it looks as if the local factors are strong enough to prevent any successful transplantation. In the GDR, for example, the leadership's fears brought on by a lack of legitimacy and the existence of an attractive German alternative in the West have combined to stifle any desire for experimentation for 20 years. In Czechoslovakia the situation is similar--the only difference being that there is discord among the leadership which is therefore afraid of all change; a legacy of 1968-69. The Bulgarian leadership, on the other hand, is successful enough in its own right to be impervious to any kind of experimentation. Poland, where many reformers inside the system are casting an envious eye on Hungary, is still living in a state of uncertainty which is characterized by disunity among the leaders and the elite generally and profound dissatisfaction among the people. In Romania, political and economic decay are so far advanced and the continued existence of the system is so much dependent on the inflated leadership of Ceausescu and his family while the use of force is so widespread that change on the basis of the Hungarian model is simply inconceivable. The Soviet Union, finally, differs in so many respects so radically from Hungary--in geographic size, social structure, traditional concentration of power and subservience to authority--that any application of the Hungarian experiment is unlikely to offer much chance of success.

All in all, the Kadar system in Hungary--as attractive as it may appear to Western commentators--has little to offer to other Soviet-type systems--all the more so, since its continued existence depends on far too many factors beyond the control of Hungarian society. If change ever comes to the nations of Eastern Europe, it will be the result of indigenous needs and traditions and not of the persuasiveness of foreign models.

ECONOMY BULGARIA

FOREIGN TRADE DATA FOR NINE MONTH PERIOD IN 1985

Sofia IZNOS I VNOS in Bulgarian No 3, 1985 p 3

[Text] The participation of the Bulgarian People's Republic in the international division of labor is increasing steadily. In the first 9 months of 1985 the country's foreign trade totaled 19.6 billion foreign exchange leva, or 6.1 percent increase over the same period in 1984. During the first 9 months of the year goods worth 383.4 million FEL [Foreign Exchange Leva] were exported; imports totaled 746.6 million FEL more than during the comparable period in 1984.

The increase in trade is the result of the steadily increasing pace of trade with the socialist countries, the CEMA countries above all. The volume of reciprocal trade with this group of countries reached 15.0 billion FEL or 76.6 percent of the country's total trade. Bulgaria's main foreign trade partners were the USSR, with 11.3 billion FEL, followed by the GDR, 965.6 million FEL; Czechoslovakia, 839.4 million FEL; Poland, 734.9 million FEL, and others.

Our trade with the nonsocialist countries is also developing on a mutually profitable basis. In the first 9 months of this year trade with such countries exceeded 4.3 billion FEL, or 8.7 percent more than during the comparable period in 1984.

Compared with last year, our trade with developed capitalist countries increased significantly as follows: Italy, 43.3 percent; Greece, 35.6 percent; Great Britain, 23.9 percent; United States, 77.1 percent, and others.

Our trade relations with the developing countries are expanding dynamically. Trade with these countries exceeded 2.1 billion FEL, or a 9.1 percent increase compared with the first 9 months of 1984. During the first 9 months of this year the volume of trade was significant with the following countries: Libya, 734.6 million FEL; Algeria, 94.0 million FEL; Brazil, 71.5 million FEL; Egypt, 64.2 million FEL; India, 64.3 million FEL; Iraq, 232.0 million FEL; Iran, 216.0 million FEL; Turkey, 118.0 million FEL, and others.

The trend which was set during the 8th Five-Year Plan of steadily upgrading the share of highly processed commodities was clear also for the 9 months of 1985. The share of machines and equipment for industrial purposes totaled 51.7 percent of overall exports, as compared to 46.5 percent for the first 9 months of 1984. Fuels, mineral raw materials, metals, foodstuffs and industrial consumer goods (noncomestible) also accounted for a significant share of exported items.

The highest share of imported goods was that of fuels, mineral raw materials and metals, accounting for 48.2 percent, and machines and equipment for industrial purposes, 33.3 percent.

Compared with the same period in 1984, exports of a number of commodities were increased in the first 9 months of 1985, including drills, pumps, television relays, motor cars, electric meters, pressure gauges, tractors, T-V-shaped iron, and others. Compared with the first 9 months of 1984, exports of metal cutting machines, items produced by the electrical engineering industry, agricultural machinery, coke, coal, goods produced by the metallurgical industry, raw materials for light industry, consumer goods, and others, increased.

SYSTEM OF CONSUMER GOODS SALES WITH FOREIGN CURRENCY REORGANIZED

Sofia POGLED in Bulgarian 16 Dec 85 p 10

[Information by Dimitur Dzhambazov, general director of the Korekom VTO [Foreign Trade Trust]: "At Korekom Starting with 1 January"]

> [Text] What changes will be made at Korekom? Will they affect the trade and economic foundations on which this foreign trade organization is built? Or will they apply exclusively to retail trade? A representative of the editors discussed these problems with Dimitur Dzhambazov, general director of the Korekom VTO.

Naturally, Korekom will remain a foreign trade organization of the Bulgarian Association for Tourism and Recreation, with its network of stores throughout the country. No other way would be possible. We are a tourist country with hospitably opened doors to millions of guests from abroad; furthermore, it would be unnatural for Bulgarian citizens to be unable to shop in Bulgaria using legitimately earned foreign currency. The general director emphasized that the changes are made necessary by the need to introduce better order in the work of foreign exchange stores, block illegal purchases and possibilities of obtaining unearned income using foreign exchange acquired through illegal deals by unconscientious citizens.

Starting with 1 January 1986 the right of exchanging up to $150 for coupons without proof of the origin of the currency will abolished. Bulgarian citizens will be able to pay for purchases from Korekom stores only withbank transfers or personal checks accompanied by a check card and an internal passport. The current coupons may be used until the end of 1986. As in the past, Bulgarian citizens will not be allowed to make purchases by paying cash in foreign currency.

Foreign citizens will use the separate foreign exchange stores which will be concentrated in tourist complexes, customs areas, hotels, and roadside institutions. Sales may be made against convertible currency in cash and presentation of a passport.

The system of imported goods will apply for goods purchased at foreign currency stores in the country, i.e., it will be forbidden to sell them to other individuals for the first three years after their purchase.

The sale of medicinal drugs with foreign exchange, so far under the charge of another trade organization, will be stopped as of 1 January. Henceforth no foreign exchange stores other than those of Korekom and the stores for personnel within the system of the Ministry of Transport, who travel abroad, will exist. The foreign exchange stores of Industrialimport, Mineralsuvenir, Valentina and Balkan will be closed down. Bulgarian economic organizations will be able to engage in trade in foreign exchange on a commission basis with the Korekom VTO.

Dimitur Dzhambazov reported that the Council of Ministers decree makes it incumbent upon the foreign trade organization to continue to improve the organization and forms of sale against foreign exchange by expanding trade based on catalogs, samples, etc. The network of stores will be reassessed and inefficient stores will be closed down.

It is clear that Korekom's trend of supplying goods and selling them in accordance with contemporary worldwide commercial experience will continue. Let us add more to the general director's statement by mentioning that in the opinion of representatives of companies with which this foreign trade organization maintains business relations, of late its flexible and able commercial approach has intensified. Changes in consumer demand are taken into consideration and global trends of price differentials among the various groups of goods are followed; seasonal price reductions and other methods are being applied.

Worth mentioning is the statement of the general director to the effect that the better the quality of the goods supplied to specific sectors in our market, the lower the sales volume of Korekom becomes. Without wishing Korekom any commercial failures, we would be happy to see more such cases and opportunities for comparison.

SOVIET AMBASSADOR GREKOV DWELLS ON ECONOMIC COOPERATION

Sofia RABOTNICHESKO DELO in Bulgarian 2 Dec 85 pp 1,4

[Article by Leonid Grekov, Ambassador Extraordinary and Plenipotentiary of the USSR in the People's Republic of Bulgaria: "Course toward accelerated development", on the eve of the opening of Days of Soviet Science and Technology]

[Text] We are truly living at a historic and crucial time. The Soviet Union and the fraternal socialist countries have taken the strategic course of fundamental acceleration of socioeconomic development and of qualitative transformation of all aspects of life of society. We have taken a decisive course toward the innovative, toward all-round development of the creative initiative of millions, toward the bold search for the most effective ways for socialist management.

As the general secretary of the CC of the CPSU (Central Committee of the Communist Party of the Soviet Union), M.K. Gorbachev, emphasized at the April (1985) plenum of the CC of the CPSU, the tasks required for acceleration of scientific and technological progress are so pressing that we must act without losing time. The party links the fundamental acceleration of scientific and technological progress to the determined reorientation of investment and organizational policy, emphasizing the technological transformation of existing firms. The party is setting the task of transition from the evolutional perfection of existing technology and partial modernization of machinery and equipment to revolutionary changes that will guarantee transition toward principally new technological systems, based on the most up-to-date technology and guaranteeing the greatest efficiency.

In the further acceleration of the socioeconomic development of our country, we are attaching importance to improved planning, guaranteeing a balanced, complex development of the national economy, perfecting the system of state administration, introducing economic methods of management, developing and expanding socialist economic integration and all-round cooperation with the socialist countries.

Acceleration of scientific and technological progress encompasses a wide range of economic, organizational, social, administrative and other problems. It affects every element of the national economy of the USSR and every labor collective.

Resolution of the task of accelerated transformation of production is inconceivable without the accelerated development of machine building. In the draft of the Fundamental Directions of the Economic and Social Development of the USSR from 1986 through 1990, and for the period upto the year 2000, we plan first of all to guarantee the radical reconstruction and streamlined development of the machine building complex; above all, of manufacturing machinery, production of computer technology, toolmaking, and the electrotechnical and electronic industry. These sectors must develop 1.3 to 1.6 times faster than the average rates of development of machine building as a whole.

We have already begun to take concrete steps in this direction. The Central Committee of the CPSU and the Council of Ministers of the Soviet Union recently made a series of resolutions to accelerate the development of key sectors of machine building in the national economy, such as automation of production, rotor and rotor-conveyor belts, and the production and utilization of computer technology. These steps are designed to create new technological processes, including automated factories that work on so-called peopleless technology. In this way, the reorganization and reconstruction of the machine building complex will guarantee the technological improvement of the entire national economy in our country.

The CPSU attaches prime importance to the concentration of efforts of the fraternal socialist countries in the key directions of scientific and technological progress determined at the high-level economic conference of the member countries of CEMA (Council for Economic Mutual Assistance) held last year in Moscow. The scientific, technological and manufacturing potential of the member countries of CEMA will be concentrated in five directions that have been given priority: electronics, automation, atomic power, new materials and technology and biotechnology.

In keeping with the resolutions of the conference, we are now developing a complex program of scientific and technological progress in the fraternal countries upto the year 2000. In the Soviet Union, we consider this an important factor in fulfilling the strategic task of accelerating the socioeconomic development of the country and a great stride along the road toward further expansion of the process of integration between the countries of the socialist community.

Consolidating their efforts, our states have set themselves the task of taking the first places in the world for strategic directions, and this task is being fulfilled successfully. As M.C. Gorbachev said a few days ago to the deputies of the Supreme Soviet of the USSR, "in recent months, political and economic ties between the countries of the socialist community have been intensified and expanded. We have developed long-term programs for cooperation in the sphere of economics and scientific and technological progress. We have created a mechanism for specific, operational ties, and coordination of foreign policy has become closer. Meetings of the leaders of the fraternal countries in Moscow, Warsaw, Sofia and Prague were important phases on the road to further unification of the socialist community".

In resolving the issues of acceleration of socioeconomic development, there are great opportunities for further expanding multilateral and bilateral cooperation between the fraternal socialist countries. This is absolutely the case for scientific and technological cooperation between the USSR and the PRB (People's Republic of Bulgaria). At the February plenum of the CC of the BCP (Central Committee of the Bulgarian Communist Party) in 1985, it was emphasized that the scientific and technological revolution conforms most fully to contemporary social progress in the interests of socialism. "In the present conditions," emphasized Todor Zhivkov at the plenum "in bringing about a scientific and technological revolution, we shall build an advanced socialist society. And, conversely, by building advanced socialism here, we shall bring about a scientific and technological revolution." According to Todor Zhivkov's intention, that will provide the opportunity to make a breakthrough in the decisive sectors of the country's economy.

In the PRB, a positive experience has already been made in industrial production, agriculture, science and other spheres of public life. In recent years, extensive experiments have been made in the country to improve the economy, to introduce the economic approach and its mechanism in the sectors of material production and the non-productive sphere; serious work has been accomplished to improve the quality of production, the organization of labor and the economy of material resources, and to consolidate labor, technological and planning discipline on a contractual basis.

We have adopted the program developed for reorganization of planning and administration of the economy and other spheres of public life on the basis of scientific and technological progress.

In other words, the maturity of the economies of the Soviet Union and Bulgaria now demand persistent improvement of our cooperation based on the achievements of scientific and technological progress which, for its part, will assist in the accelerated socioeconomic development of the two countries. An important prerequisite for the further development of cooperation between the USSR and the PRB was the friendly greeting in fraternal Bulgaria of the General Secretary of the CC of the CPSU, M.C. Gorbachev. The leaders of our countries came to the conclusion that, at the present stage of development, we need "more effective, bolder and more flexible methods of cooperation". The first practical steps were taken at the time of the meeting. An intergovernmental agreement was signed to create two Bulgaro-Soviet scientific production companies in the sphere of machine building. On the basis of the integration of scientific production potential of our countries, we are planning the organization of joint, large-scale serial production of modern, highly productive manufacturing centers, GAPS [not further identified], robots and other scientifically based products.

At the meeting of the two leaders, it was remarked that the expansion of specialization and cooperation of production between the USSR and the PRB demands a constant high standard, excellent quality and reliability of production.

As we all know, many important initiatives have resulted from Bulgaro-Soviet scientific and technological cooperation, which later became very popular within CEMA. It was precisely in this way that the creation of joint Bulgaro-Soviet scientific collectives began, of which there are now more than ten. The application of complex, goal-oriented, programmed planning of scientific and technological ties began for the first time between our two countries. As has already been pointed out, for the first time in the practice of CEMA an agreement has been signed for the creation of two Bulgaro-Soviet scientific production companies. We are considering the possibility of building a series of such companies, including those based on joint common ownership. Essentially, such a stage of cooperation between our countries is beginning when its most important form becomes close integration based on direct integration of scientific, technological and production potential.

It is quite obvious that this direction of cooperation contains within it enormous opportunities both for intensifying and further expanding our economic ties, and for accelerating the development of science and technology in the two countries. In the following 5-year plan we shall develop jointly about 300 problems and topics, including 50 most important inter-sector problems of science and technology. Academicians in both countries have agreed upon seven complex goal-oriented programs of cooperation and 19 large-scale problems. A significant part of the subject-matter is directed toward the decisive increase in the quality and technical standard of products made in our countries based on specialization and cooperation.

Scientific and technological progress, cooperation in the sphere of science and technology have become today the mainstay of reciprocity between our countries, since they are conducive to the achievement of the highest world level of joint production. The Days of Soviet Science and Technology that open tomorrow in the PRB are dedicated to the discovery of new resources and opportunities for this cooperation.

NUTRITIONAL DIET JUDGED UNSATISFACTORY

Sofia RABOTNICHESKO DELO in Bulgarian 2 Dec 85 p 5

[Article by Prof Khristo Khadzhinikolov: "A Costly Profit: Meatless Dishes -- the Bulgarian People's Traditional Food", under the rubric "Market, Goods, Services." Passages in slantlines rendered in boldface in text.]

[Text] Food is fundamental to the correct development of the human organism, to maintaining its working capacity and creating greater resistance to harmful factors in the course of work and in the environment. For many years, the workers and the rising population of bourgeois Bulgaria consumed less than the required amount of animal proteins on account of the difficult material situation. For this reason, from the very first years of the revolution of the 9th of September, the party began to conduct a policy of accelerated development of the sources of animal protein. As a result, only in the last 14 years (1984 compared with 1970), the consumption of meat per capita has grown by 171.5 percent, of eggs -- by 194.3 percent and of milk -- by 158.9 percent. With that, objective conditions were created as early as the 8th 5-year plan for the consumption of meet per capita to come as close as possible to the rational norm. The average per capita consumption of meat during 1984 was 71 kg, compared with the norm of 80 kg.

However, the consumption of vegetables /lagged considerably behind the rational norm/.

During 1984, compared with a norm of 180 kg per capita, it was only 104 kg; and for fruit, compared with a norm of 200 kg, it was only 116 kg.

Everyone knows that fresh vegetables are a very valuable and cheap food. They are rich in vitamins, mineral salts and fiber, absolutely necessary for people today who lead less active lives.

Milk and milk products contain valuable animal proteins. In 1984 we consumed on average 186 liters per capita, or 71.5 per cent of the norm. It should be pointed out too that we are considerably behind some other socialist countries in our consumption of milk. In the USSR, the consumption of milk is over 310 liters per capita, and in Poland -- around 450 liters. A fundamental reason for this lagging behind is that in our restaurants and cafeterias, in which over 2.2 million workers, students and employees eat every day, milk is offered mainly fresh and as yogurt, and rarely in milk foods and desserts.

Our people continue to call meatless dishes lenten fare, because through the long years of poverty which have accompanied them, they have used very little fat. With the aim of enriching the contents of meatless vegetable dishes by using animal proteins and improving the quality of taste, 5 or 6 years ago a group of scientists and the best preparers of national meatless vegetable dishes were assigned the task of examining recipes and enriching them with milk, butter and eggs, without reducing their vegetable content. These recipes were approved and published in a separate book in a general collection of recipes for public eating places. However, they found little application on /purely economic grounds/.

It is worth remarking, that in recent years other socialist countries have been introducing a policy of encouraging the production and consumption of meatless vegetable dishes, and in 1984 the USSR published a book on the modern vegetarian kitchen. The number of overweight people has not yet become a national problem here as in some other socialist countries. However, investigations in the okrugs of Pleven, Burgas, Blagoevgrad and Tolbukhin have shown that in the population at large, on average one in five is overweight. One of the reasons for this is the wide-spread consumption of baked goods that are rich in butter and sugar. Frequenters of our pastry shops grow fat very rapidly. But they are only offered "heavy" pastries, cakes and other desserts. As early as 10 years ago, the Scientific Center for Trade and Public Catering developed the recipes and the technology for low calorie fruit desserts. It turned out that they were very tasty, well received by consumers and less labor-intensive compared with normal cakes and pastries. However, there is one insurmountable obstacle to their mass production -- they are cheap, and make it more difficult to fulfil the plan for commodity circulation and profit.

In several party documents and in the theses of the 12th congress of the party, public catering was assigned the task of rapidly increasing the quantity and assortment of meatless cooking products. To date, /the results remain unsatisfactory/ because the objective obstacles of an economic nature have not been removed. Basically there are two obstacles:

The sale of meatless vegetable dishes, which are very labor-intensive and considerably cheaper than meat dishes, realizes little commodity circulation and profit. This contradicts the economic interests of the public catering firms. Profit is a fundamental factor in setting up a larger residual results-based fund -- salary -- and the mark-ups determined for meatless dishes are not economically well-founded. In order to provide a greater supply of tasty meatless dishes, enriched with milk and eggs according to the new recipes, we must correct their mark-ups, taking full account of their actual expenses. Another way to resolve the problem is to increase the trade discounts on vegetables, milk and eggs, for public catering, only, and to reduce the discounts on beer and spirits on which the public catering firms are now making a considerable profit with fewer labor expenses. We should bear in mind that in the USSR the trade discounts on food products for the state public catering firms are considerably higher than those granted to the stores network.

With the system of labor compensation in the public catering establishments that is now proposed, the size of the results-based salary fund is determined from the rate (percent) in financial terms of the commodity circulation realized. This provides an economic incentive for the working collective to sell the more expensive meat dishes and to avoid offering the cheap dishes. With the aim of eliminating this anomaly, the 53rd decree of the Council of Ministers of 14 September 1985, has set the task of introducing labor compensation in public catering /subject to production realized in kind/ and of stimulating production and supply of meatless, milk, egg and fish dishes.

The simplest and most effective incentive system for labor compensation in the spirit of this decree can be achieved by moving away from a rate of realization of commodity circulation of 100 leva, as an expression of value, toward a conventional commodity circulation, i.e. toward a rate per 100 conventional portions of dishes sold. A similar conventional commodity circulation has long been used here to classify eating establishments in connection with the salary rate for the manager and head chef.

With the formation of a salary fund in individual public catering firms on a results-based rate per 100 realized conventional portions of dishes and desserts, we shall stimulate, on the one hand, production and supply of meatless vegetable dishes and fruit desserts, and, on the other hand, a greater turnover of private pastry and culinary production, instead of industrially produced food products.

The proposed system for determining a salary fund will also provide an incentive to cafeteria workers to prepare meatless and more labor-intensive dishes which are now avoided given the existing periodic bonus system of labor compensation. It will also have a stimulating effect on culinary production in the tourist resorts where, for the same reasons, meat dishes are chiefly offered now.

The production of tasty meatless vegetable dishes and fruit desserts requires greater culinary craftsmanship. It is well known that dishes are tastier with the addition of meat, even when the chef is less well qualified. This means that, parallel with the removal of obstacles of an economic nature from the production of a wide assortment of meatless dishes, we must conduct courses to acquire craftsmanship in such dishes according to the new recipes. Those who complete the courses successfully would receive a certificate and their salary would be increased by 15 to 20 leva as an incentive to production.

CRITICAL STATE OF WATER RESOURCES EXAMINED

Sofia NARODNA MLADEZH in Bulgarian 1 Dec 85 p 3

[Article by Lyudmila Paunovski: "Dried-Up Springs". Passages in slantlines rendered in boldface or italics in text.]

[Text] There isn't enough water! Have we done everything to discover it? The reserve of small water sources.

The prolonged drought forces us once more to recall certain well-known truths. The most important is: Bulgaria is one of the countries in Europe with the poorest water resources. According to data published in the bulletins of the Committee on Water Problems at the Economic Commission for Europe, the annual per capita rainfall here is 2230 cubic meters, whereas in our neighboring countries alone this figure is 10,600 cubic meters for Rumania and 12,250 cubic meters for Yugoslavia. Moreover, our water is unevenly distributed and subject to considerable seasonal variations. But our water needs are constantly growing. This is why various calculations are made which we can't be happy about. They indicate that, if around 1990 we come up against another drought, compared with our needs at that time there will be a clear deficit of 2 billion cubic meters of water. Toward the end of the century, this deficit could reach double the figure!

/There is, and there isn't./ In normal years, we have 386 liters of drinking water per capita per day! But the sums don't add up ! They are simply not accurate! Because from that amount, 275 liters go to satisfy the needs of industry and the public sector! In Sofia itself during the hot and dry August, 611 liters were secured per 24 hours for every inhabitant. At the same time, two-and-a-half million cubic meters of drinking water were fed into the L.I. Brezhnev construction and installation combine alone, and other manufacturing companies took just as much. None of them fulfilled the instructions for exploration of their own water sources on time.

In Sofia there are about 200,000 cars. Let's suppose that 10 liters of water per day are needed to wash every one of them. In spite of fines and bans, car-washing continues because there are few state wash areas, and then the agencies of the Control of Automotive Transport are entitled to give punitive sanctions for driving a dirty vehicle. Is it really so difficult for every regional people's council in the capital to set aside at least one square where they can dig out several wells and install car washes.

And there are other paradoxes. By law, the reservoirs for drinking water in inhabited places must contain 30 percent of a 24-hour consumption so that, if needs be, peak consumption can be met. But only about 20 percent of the settlements in the country that are supplied with water have reservoirs, which contain on average barely 7 to 8 percent of a 24-hour consumption. Which means that even at normal source capacity there is an apparent, planned shortage of drinking water at peak hours, not to mention the drought years.

The moment is clearly ripe for the designers of water supply to develop projects in such a way that they take into account the seasonal satisfaction of needs. That is, alongside the basic water source to request information and include in the project local water sources which also replenish the settlement reservoirs of drinking water. These local water sources, which for years on end we ignored under the pretext that they were small, would assist in surmounting the periodic crises, especially during the hot summer months.

/With tradition toward the future/ The need for industrial companies to secure their own water sources for production was assessed. But why do we continue to ignore the obvious conclusion that we need a full reevaluation of the role and place of small water sources to meet our needs of drinking water and relatively clean water for agriculture? According to different information, half a century ago there were around 500,000 such small water sources in our country -- wells, fountains, springs and reservoirs -- which met the drinking and daily needs of a large part of the population. How many are left today?

We have seen in old newsreels the genuine joy that people show when water is piped in. Eventually, the yokes and buckets will be forgotten; we have only to turn the little faucet and the life-giving moisture is in our homes. But why is a peculiar nihilism beginning to spread, somehow unnoticed, toward the small water sources that have served generations on end? Faucets arrive in rural homes and we forget the well! This is not just a play on words*. The wells are beginning to be filled up en masse. In places, the unthinkable has already occured -- they have been turned into septic pits, and the pollution has been seeping into entire water terraces. The piped springs with crystal clear water have not been maintained. Many of them have been forgotten and no longer hold water. Hundreds of fountains have been neglected and destroyed, some of which were cultural monuments connected with the history and development of our people.

In the past, excavating a well, cleaning a spring or building a fountain was considered a moral duty. It was a tradition for young people with the means, when gathered to go carolling or carousing at New Year, to build fountains. Today, the tradition is not entirely forgotten. In honor of some sports or recreational holiday, the Fatherland Front and Komsomol organizations build fountains and arrange rest areas around them. Last year alone, with the help of the BTU (Bulgarian Tourist Union) and the participation of tourists, 65 mountain fountains were constructed and another 11 were raised in honor of the 90th anniversary of the Organized Tourist Movement.

/Huntersand fishermen prepared for the 100-year jubilee of their union by building over 1500 new fountains. On the initiative of the settlement leadership and with the help of volunteer work days, 6 fountains have been renovated in the village of Suedineniye, near Turgovishte. Still more enthralling is the example of the town of Pliska. Of 400 wells which have met the town's water needs for centuries, over 300 have been restored!/

And yet so often such phenomena are incidental, they have not become practice, nor have they been recognized as necessary. There are plenty of obstacles of all types. Let's say that some young nature-lovers decide to explore unknown springs, old fountains and filled-in wells. They would be a chief moving force in a settlement system in such a campaign which could be combined with getting to know the historic past, developing a sense of patriotism and love for the native land.

But doesn't someone, above all the people's councils, have to specify in which regions we should concentrate our efforts first of all. Where water provision is most pressing! Don't we need a guarantee that the search for small water sources is not simply to give an account of activities but will be of real purpose. Because many of these water sources are in regions where almost no-one lives any longer. And don't we need prospecting technology, and a guarantee of at least the minimum resources, such as raw materials and equipment. And let's not forget laboratory tests for the suitability of the water that is found.

In this way, the enthusiasm and amateur activities in the exploration of new small water sources and the renovation of old sources must give way to organized activity, in which the people's councils are obliged to play a major role. In every settlement system special groups can be set up to index all necessary small water sources and note by region the need to discover new ones. They should be plotted on a map and concrete time limits outlined for them to be brought into effect.

This can be done through a special program which obliges departments, economic, sociopolitical and popular organizations and individual citizens to participate actively in this activity. Specialists should develop projects to give the final touches to vertical and horizontal surveying of water sources, and when construction itself begins, which above all should be done by volunteer work or the resources of individual companies, the people's council should guarantee the technical safeguards and leadership.

Then, pioneer, batallion and comsomol organizations will take the lead in discovering and protecting small water sources locally. And we shall guarantee resources through campaigns for gathering the secondary raw materials, and students themselves will be active helpers in building and developing the surrounding area. This could soon become reality if we take to heart the resolution of the Public Committee for the Defence of Nature, the National Commission for Construction, Planning and Sanitation of Settlement Systems at the NU of the FF (National Union of the Fatherland Front) and the National Council on Water for rational use of water from local water sources.

World practice shows that a water crisis is more easily overcome with small water sources. Our needs in drinking water and water for every-day use are almost soluble in recreational and tourist areas and in the private economy, especially in less populated areas, as are the needs for industrial water.

That is the simple truth, which we have to recognize -- the people's councils, economic, sociopolitical and popular organizations, all of us. Let's bring back the water to the springs and fountains, to the reservoirs and wells!

* Pun on the Bulgarian words for faucet and well.

DIFFICULTIES AT MARITSA-IZTOK POWER STATION SURVEYED

Sofia OTECHESTVO in Bulgarian No 22, 26 Nov 85 pp 13, 15

[Article by Valentin Markov: "Maritsa-Iztok on the Eve of the New Winter"]

[Text] Last winter, when the shortage of electric power excited the spirit of the people, the names of the three power plants of the Maritsa-Iztok Economic Mining-Power Combine (SMEK) turned into adjectives. All of a sudden from something abstract, something seemingly remote from daily life, they acquired a very substantive, and even fatal significance. Was there an adequate supply of coal, had the conveyor belts thawed out, were questions with which every bit of news coming from Maritsa-Iztok was welcomed. Was the significance of the combine in terms of national power supplies been exaggerated at that time? Perhaps. Nevertheless, when 20 percent of the electric power production declines by nearly one-half... Furthermore, part of the problems which faced the power plants of Maritsa-Iztok were problems affecting other Bulgarian thermoelectric power plants as well. That is why, on the eve of the new and, according to forecasts, equally severe winter, the following question is entirely legitimate: Are they ready to welcome the cold and the snow and to react to all the whims of nature and technological surprises?

Purva Komsomolska TETs

This is the oldest thermoelectric power plant in the complex with the lowest power-generating capacity (400 megawatts). It uses predried coal. A high percentage of the equipment is old, which leads to an increase in the number of breakdowns. Until 17 February 1985 the power plant worked relatively well. After that, however, the daily load began to drop, and so did the supply of industrial steam to the only briquettes factory in the country. The reasons? In addition to the worsened technical condition of the equipment, caused by insufficient repairs in previous years, major problems were developed in the fuel oil systems. Instead of reaching the necessary 150 degrees, the fuel was heated to 80 degrees C, which resulted in overexpenditures and reduced power. At low temperatures the recording instruments of the end boilers froze. Without them, however, maintaining an optimal system is difficult....

Today the mood at the Purva Komsomolska TETs is different. Two additional heaters and a fuel oil pump have been installed, and the recording instruments at the boilers have been insulated. Substantial repairs were carried out at the fuel supply and boiler shop. However, boiler repairs will continue until the beginning of 1986 and it is only then that the boiler shop will have equipment in relatively good technical condition.

What else remains to be done? The most concerning feature is the lagging in the implementation of the repair program at the drying shop. Work intervals between repairs are violated and the shop is still not ready under winter conditions. Another cause for concern is the state of the controlling systems of turbogenerators Nos 5 and 6. As a whole, little has been done at the power plant to insulate pipes, core samplers and pulse lines. There simply are not enough workers, for some 60 people are needed for insulation work alone. Obviously, the combine's management and the Ministry of Power Industry must react quickly.

In conclusion: in the 1985/1986 winter season the Purva Komsomolska TETs will have equipment whose technical condition will be relatively satisfactory. This will make it possible to maintain an average hourly load of 250 megawatts and, at peak times up to 280 megawatts excluding the first turbine, and respectively, 340 and 380 megawatts with turbine No 1.

Dimo Dichev TETs

At this power plant we clearly felt the tension under which Bulgarian power workers are operating. We began by attending the meeting of the party committee which was precisely engaged in a discussion of the extent of readiness for the winter in all aspects. Perhaps because the power plant was, until recently, the largest and newest in the complex or perhaps because last winter it had "suffered the most," the statements of workers and managers showed concern for the course of preparations. An unsatisfactory assessment of accomplishments was provided in a self-critical spirit.

Yet, a great deal had been accomplished. Within a short time, from March to October, repair operations which should have been carried out for the entire 8 preceding years had been completed. As a result of uninterrupted operations, without reserves and basic repairs, most of the main equipment had broken down as early as the beginning of last winter. That forced the Council of Ministers to approve a special repair organization. Hundreds of skilled workers were assigned from neighboring okrugs and considerable funds and technical facilities were appropriated. Therefore, by the end of November, the basic repair activities for the four blocks will have been completed. The power plant will meet the winter in a renovated and good technical condition, which will enable it to maintain an average hourly load of about 680 megawatts. No less important social problems must be resolved, such as heat at the work places, winter clothing and the condition of the auxiliary equipment.

Maritsa-Iztok 2 TETs

Following the commissioning of power block No 6 on 30 September 1985, the overall generating capacity of the power plant reached 1,020 megawatts. The question now is whether it will be able to maintain its planned high average annual load during the winter or whether despite its expansion and reconstruction problems will remain.

Last winter, coal supplies created the greatest difficulties at the Maritsa-Iztok 2 TETs. The old conveyors from the drying plant, which were extremely unreliable, were used. The worst point was reached when the coal was being fed through a single underground conveyor belt, at which point the load dropped to 200 megawatts and the fuel oil was almost exhausted....These weaknesses are now considered eliminated. A new system has been applied for supplying the coal with the help of new conveyor belts. Nevertheless, during the forthcoming months as well, supplying the coal will remain the main problem. Coal reserves are insufficient (because of unfinished construction around the open-air warehouse). The second crane which receives and processes the coal has not been installed and some of the conveyor belts have not been completed. Here as well the reason is the scarcity of workers, for the large construction and repair program is absorbing all available manpower. Nevertheless, the condition of the plant is much better compared with last year.

Necessary Summations

Any visitor of the Maritsa-Iztok SMEK today can see the stressed and responsible work being done. This covers everyone, workers and directors, and not only the power plant, but the mines and repair enterprises as well. A great deal is being expected of the type of organization which has been created (with continuing control, guard duty, etc.). However, winter is already knocking at the door. Let us, therefore, look at the overall picture.

Coal: In terms of this combine, this problem has been resolved; coal reserves are insufficient only for the Maritsa-Iztok 2 TETs and regular and direct supplies must be organized. According to Engineer Zhivko Stoyanov, Maritsa-Iztok SMEK deputy director, coal supplies will be organized on a rhythmical basis.

Fuel oil: Considerable overexpenditures in fuel oil occurred last winter because of difficult operating conditions; the power plants are currently trying to catch up. At the Dimo Dichev TETs, for example, daily fuel oil expenditures averaged between 5 and 10 tons. This is a good result and proof of the great importance of capital repairs in saving on liquid fuels. Reserves, however, remain insufficient.

Spare parts: Most of the operational engines have already been amortized. The solution of this problem remains outside of the power plants' possibilities.

Manpower: All in all, the combine needs some 1,200 new workers. The most difficult is the situation at the Maritsa-Iztok TETs, which is short of 400 to 500 workers, mainly for the two new blocks. It is hoped that the new Council of Ministers decree, which raises the salaries of power workers, will resolve this and many other problems.

Discipline and skills: These problems largely depend on the power plant's leaderships. Sometimes high rates are awarded undeservedly in order to keep the people on their jobs. Some repair workers do not use their working time efficiently and frequent breakdowns lower discipline in the shops. Maintning the expensive equipment requires high work skills, for, in the words of one of the directors, a system in a good technical condition could break down in a matter of minutes as a result of carelessness or incompetence.

In the future (something which must be done!) the individual contribution of every worker, and his ability and knowledge will be studied closely. Courses will be offered and tests given, and the hundreds of expected workers will be trained.

One may say that the lessons from the difficulties in electric power production, which occurred at the beginning of the year, have been learned and the mechanism for their elimination has been put in place. We are on the right way. Everything else depends on the efforts of the individual workers.

READERS' LETTERS EXPOSE EMBEZZLEMENT, THEFTS, SQUANDERING

Editorial Comment

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Text] The headline of this page "People Protecting Themselves From Prying Eyes" was borrowed from a reader's letter published ANTENI No 45, written on the subject of the article "A Needle Pinned on the Lapel." Entitled "The Protection of Socialist Property is Everyone's Concern and Responsibility," the letter commented on cases of abuse in stores and public catering institutions which employ husband and wife couples, entire families or other relatives. The editors are continuing to receive letters describing attitudes not only concerning "family businesses and dealers with wedding rings," but, generally, violations of legality, abuses and encroachments harming national property. Following are some of them.

Prosecutor's Investigation

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Letter by Genko Angelov, rayon prosecutor]

[Text] Allow me to inform you of the following on the subject of the letter of a group of sales clerks at the Vit supermarket of the Food Products Trade Enterprise, under the title of "No One is Interested;" a preliminary investigation is being conducted by the economic department of the Pleven Okrug MVR administration and the State Financial Control Office in Pleven, based on the complaints filed by Stoykova, Kostova and Khristova.

An investigation is also under way on the grounds for which the chief accountant ordered that the wages of the sales clerks be withheld. The filers of the complaint will be informed in writing of the results of the investigation and the opinion of the prosecutor's office.

Sales Clerks' Abuses

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Letter by Radoslav Tsvetkov]

[Text] I shall not attempt to retell the content of the article "Needle Pinned on the Lapel." For a long time this newspaper has sounded the alarm on the subject of the recently increased frequency of negative manifestations in trade and public catering. I would like to expand further some aspects of the appropriation phenomenon with which, in most cases, we somehow try to excuse, to lower the ugliness of the action and to act ethically (here I am, using that undesirable word, which covers almost half of the nature of the matter) toward the violators. What does a violator mean? What does the term "malicious damage" mean, based on the instruction which was quoted? Why is it that a thief--for that is his real description--is to be delivered to the prosecutor's office only after he has "appropriated," and again, forgive me for this borrowed term, no less than 2,000 leva's worth of state and people's property? Jean Valjean suffered for the rest of his life the consequences and the shame of stealing a loaf of bread to meet a vital need. Are our thieves in trade and public catering stealing to meet precisely the same crying needs? Are they dying of hunger or are they walking barefoot and naked on the streets?

Sooner or later, anyone who steals goes to jail. However, are we also not to blame? We have witnessed the way the sales clerk in a supermarket will allow access to the premise behind the counter of someone she knows, and will let people wait in line while she is wrapping up a few large pieces of meat. She does not even weigh them in order not to irritate the waiting customers, but quietly sends her visitor away.

Surpluses? This is another extenuating term. It is not surpluses that are being created but thefts which are being committed. In his aspiration not to be "short," the materially responsible official appropriates the surplus after working time. Have any controlling authorities come to stores after closing time to ask such officials what they are doing?

But does this occur in such places only? What about waiters and people providing communal consumer services?

Obviously, this can no longer be tolerated. Shall we be able to reach the root of this evil? Most certainly yes, if we set ourselves this target. We could also make preventive struggle much more effective. We can also set up and develop a public, a state, a national intolerance of the thief, the bribe taker, the extortionist and, particularly, the recidivist.

How can this be accomplished? In my view, not by waiting until all possible complaints in a case have been received or be satisfied with newspaper publications and think that the culprits have been deservedly punished, but by making it impossible for them to be among us even with the slightest delinquency, for such a person is much more dangerous than a murderer towards whom the law is much stricter, for such a person kills in us the belief that we can achieve all that he has achieved but honestly. We constantly keep clashing against the tempting standards he maintains. We can see his summer cottage, the cars he keeps changing, and objects bought at Korekom. We also see his arrogance.

We can also find means not to struggle against but to uproot the evil! That is what I suggest to the thousands of readers of this newspaper to think about, so that it may be suggested, considered and legalized as a status, as a code of honor, as an efficient preventive measure.

Land and Water Waste

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Letter by Radi Georgiev]

[Text] The topic of waste, theft and appropriation could be broadened and some of its other coordinates found. Usually we deal with the basic parts of this problem, for the guilt is obvious and very easy to determine. However, is it not a case of waste when a shortsighted enterprise management has incurred losses in its production activities and failed to fulfill plan indicators? Is it not a waste when funds from the so-called director's fund are being spent on trips, drinks and banquets? Would it not be better for us to be tighter with the money when it is a question of the people's good? We are simply offering some people the possibility of benefiting at the expense of the state in a totally unaccountable fashion.

Since the question of waste is being raised so sharply, we should take a stricter look at other problems. Let us consider, for example, the waste of water and land! The press took up the question of the closed cycle in enterprises. In most areas which require the use of huge amounts of water, recycling has still not become the fashion. However, we should seek the reasons for the drought also by going to those who cut out oak trees and plant pine, who are engaged in "sanitary" cutting in our forests and who are changing the natural ecological conditions of our land. Why is it that so much fertile land is now lost forever under shops and buildings of industrial enterprises and combines? Such an insensible use of the land, as is also the case in the expansion of residential complexes, when cities are built not on their present territories but far outside their limits, is frightening. We are not so rich as to be able to engage in all sorts of indiscriminate wastes.

Bribery in Procurement Systems

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Letter by Vanya Georgieva, Iliyantsi Residential District, Railroad Blocks]

[Text] I would like to draw attention to something which is an open secret. If a store is well-supplied with goods it means that its manager is dipping in the till not only for himself but also for the so-called placing and procurement workers. No one would bring you goods unless you dipped into the till. How to compensate for such losses subsequently becomes your own problem. Procurement workers bring the goods, falsify documents and later, in the manager's office and frequently, by the cash register, cash in the "gifts" they have received elsewhere. This is a hint for the manager to contribute his share, something like a rental payment, only not monthly or annual but daily: today from one or several shops, tomorrow from others, in sequence. The chain does not end there but goes higher. The marketing workers also bribe chiefs of warehouses who, in turn, in all likelihood...how many people are thus involved in the game?

Could it be that the procurement and servicing system has something that is not in order and is faulty at its very core? Is the system organized in such a way that honest people who go to work in trade can either not survive or have to adapt? What about those who have already adapted themselves?

The struggle must begin at the roots. The organization must be changed and the system reorganized. This will not be easy!

Criminals Must be Named

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Letter by Luchiya Petrova]

[Text] There are people who have become accustomed to think that thefts occur exclusively in restaurants and food stores, where surpluses could accumulate! This is not true! Do you know the way furniture is purchased? No theft takes place there, there one pays in cash, perhaps 100 or 150 leva, if one is to buy a piece of furniture directly at the warehouse. One may even give such money to the common laborer who promises to find the item, in which case one may rest assured that he will deliver the money to the proper place. Otherwise, one may keep making the rounds and checking and putting one's name down on waiting lists.

What if someone needs construction material? Could one guess exactly when suchmaterials are available at the warehouses without tipping a few 10-leva notes around? The bribes charged by cab drivers, store keepers and waiters are nothing compared to the harm done to citizens in other areas....With bribery, a tinsmith was able to make several bids for cars which he then sold for double or triple the price. Meanwhile the state authorities shut their eyes. Personnel in rayon councils are bribed to issue housing. Why are such cases not made public? Would public opinion suffer if it is publicly mentioned that someone is a criminal? This, it seems to me, is one of the reasons for the lack of publicity. In my view, the culprits must be clearly named. The roots of violations must be eliminated early and deeply. The entire system for treating the "disease" must be applied if recurrences are to be prevented and the further spread of the disease blocked.

Culprits Punished

Sofia ANTENI in Bulgarian 4 Dec 85 p 4

[Letter by Nadezhda Kirilova, deputy chairman of the executive committee of the Dimitrov Rayon People's Council]

[Text] Concerning the note entitled "Facts Without Comment" (No 45), we wish to inform the editors that Borislav Ivanov, former manager of Store No 49, 179 An. Zhdanov Street, and his wife Angelina Ivanova were fired because of fund shortages totaling 6,204 leva. Borislav Ivanov was also charged with misappropriating trade funds and delivered to the judicial authorities.

Supreme Court Justice Comments

Sofia ANTENI in Bulgarian 27 Nov 85 p 2

[Letter by Supreme Court Justice Todor Todorov]

[Text] The article "A Needle Pinned on the Lapel" triggered serious thoughts concerning criminal encroachments in trade, noteworthy for their impudence and scope. It may appear to some that the author selected cases of more notorious economic trials for the sake of creating greater public interest in the topic. This would be naive, for misappropriation cases involving sums ranging between 50,000 and 100,000 leva in trade are being tried on a daily basis by the courts and have long stopped being "sensational." The author is amazed not only by the scale of such crime but also by the strange phenomena which accompany it. He justifiably raises the sensitive yet still unanswered questions of how can economic criminals engage in their "business" "calmly" under socialist conditions? Why is it that after they have been sentenced and deprived of their rights, once again they show up elsewhere as materially responsible individuals and continue to plunder the people's wealth? Where from do they draw their courage?

The questions of the economic negligence of managing and control authorities has been raised frequently. However, this takes place after a major scandal is discovered and both money goods are "already vanished." It was at that point that we discover that someone has made a poor personnel choice and, in violation of Council of Ministers Letter No 127, allowed "devils" to enter the "Garden of Eden." It becomes apparent that others have not checked the accounts of the store manager with the inventory and the actual cash payments. Others again have failed to be impressed by the fact that some stores are always well-supplied with scarce goods and have a high sales turnover, while in their vicinity there are other stores whose clerks remain idle. We are surprised by the fact that some thieves have been audited 7 or 8 times and always cleared. This also affects the law enforcement authorities who have exposed and punished criminals. Journalists express the angry indignation of the public....but what happens at the economic enterprise? The director looks for someone to replace the expelled "devil" and frequently comes across...another "devil." Meanwhile poor management and the carelessness of economic managers and auditors are ignored.

Cases even worse than those described in the article "A Needle Stuck in the Lapel" exist. Take the case of Kol'o Markov, former director of the Public Catering Economic Enterprise in Dimitrov Rayon in Sofia. He managed his small empire as he wished and according to his own laws. Fierce reprisals were applied against anyone who dared to disobey his orders. He had his own repression authorities for such purposes....

The question is, where do such people get their impudence and confidence? How is it that such responsible economic figures trusted by the state turn into criminals? I do not believe in their sudden transformation. Something sinister and dirty must have been hidden in their hearts. If such is the case, who put them in such positions, who assessed their moral and practical qualities, and who has been observing years on end their economic "scope?" Economic criminals have been given support and confidence by others, concealed behind the social stage....It is not jobs that corrupt people. Thousands of economic managers organize and manage our economy honestly and with dedication. In order to protect their reputations and prestige and stop the efforts of criminals to "redistribute" unofficially the national income, we must dig deeper and reach the very roots of economic crime.

More Opinions Needed

Sofia ANTENI in Bulgarian 4 Dec 85 p 2

[Text] In connection with the article "Needle Pinned on the Lapel" (No 42), in addition to the letter by Supreme Court Justice Todor Todorov, the editors have received a number of letters but only from our readers. This proves civic and social awareness and a sharpened feeling concerning violations of the law not only in trade but in all economic areas. This newspaper expects the response of the specialist as well--trade inspectors, managers, finance auditors and representatives of control bodies. The article which triggered the dialogue among readers against encroachments on socialist property raised the following question: how are the special instructions on missing funds, damages and misappropriations implemented; should the culprits, whether they committed the crime with malice aforethought or not, be prosecuted? An answer to this question should come from financial and legal authorities. Furthermore, there is a special ukase which forbids appointing people indicted or sentenced to hold material accountability positions. This ban is not always observed by trade workers and other economic managers. Who will explain the reason for which the categorical stipulations which are a law aimed at protecting the common property are being violated?

BOTH UNIMPROVED, DEVELOPED LAND ZONED FOR HOUSING CONSTRUCTION

East Berlin ARCHITEKTUR DER DDR in German Vol 34, No 9, Sep 85 p 561

[Article by Eng Christa Menz, Council of Kreis Belzig: "The Building Land Law--A Good Foundation for the Preparation of Master Plans--A Discussion Contribution Based on the Exchange of Experiences Pertaining to Work Done With the Building Land Law at the Postgraduate Institute for Town and Country Planning and Architecture at Weimar"]

[Text] The orderly spatial development of our cities and villages is only possible on the basis of mutually coordinated and long-range planning. Consequently, in recent years long-range concepts were worked on in an intensified manner. The focal point in this work was the long-range concept for solving the apartment question through the year 1990.

For every city, for every community, it must be proven that every family can have an apartment which fulfills its essential needs. A maximum number of apartments in the inventory are to be modernized.

Work on this concept in our Kreis Belzig also required intensive and goal-oriented cooperation between all council jurisdictions, and particularly required a precise analysis of the inventory and needs. A quantitative recording was not adequate--qualitative data were required.

But the analysis already had to take into account the need and the changes in the inventory. Additional problems existed with respect to the investigation of the possibilities for covering the need.

The comprehensive and extensive tasking resulted in a necessity for working out a long-term concept for all areas connected with the solution of the apartment dwelling question, so that the final results represented not only concepts for the solution of the apartment question, but included additional concepts which were consulted upon, coordinated, and confirmed, including the developmental concept for the Kreis-managed construction industry, the school network, and the trade and business network, as well as other concepts designed to provide for citizens and deprive them of worry. From phase to phase, the work became more and more specific.

The results then found their municipal construction expressions in

1) master planning,
2) community formation concepts,
3) concepts applying to localities, and
4) development plans.

The results of the detailed planning were transferred to the long-term concept. This constant feedback assured us of the efficient utilization of building land, of the available construction, and of the reserves of municipal facilities, which assured us of the optimum utilization of our fund inventories and the fulfillment of the overall goal.

The harmonious formation of our cities and villages is a fundamental prerequisite for a feeling of well-being among our citizens--not only in their dwelling units, but also in their residential areas. The feeling of well-being and connection with the settlement is important for purposes of identification with the environment and the resulting sense of responsibility both for one's own as well as for the people's property. It is this feeling which gives rise to activities designed to maintain and beautify the environment.

Consequently, it is far from adequate to simply inform our citizens of what has already been agreed on and set forth in planning documents. After all, one can expect cooperation and the contribution of resident proposals and hints only if one informs them on a long-term basis.

On the basis of long-term concepts, for example, of the master plan, this kind of information is absolutely possible. But it is already discernible in practice today that the Building Land Law is only invoked in cases where problems exist with the availability of building land or the utilization of built-up lots.

The demand for timely information regarding planned construction projects in accordance with Sections 5 and 15 of the Building Land Law and Sections 1 and 10 of the first implementation decree has its reasons. Cooperation and coresponsibility on the part of citizens in solving these tasks require timely information at a time when changes are still possible. A mere announcement of provisions fails to activate citizens but easily leads to temporizing actions.

That is why all directives issued by the local councils referred to the principles enunciated in Section 3 of the Building Land Law. It was required that the master plans and the locality formation concepts be repeatedly discussed and be presented for examination.

During the discussions, problems are also discernible on a timely basis and a timely and goal-oriented exertion of influence is facilitated.

Frequently, given the pressure to solve existing tasks of the day on a short-term basis, the long-term concept is not taken into account and is, thus, endangered. However, we must solve today's tasks with a view toward tomorrow.

Every master plan is condemned to failure if it does not form the foundation for detailed planning. In realizing the individual phases, there is the need to assure the overall goal through constant updating.

The long-term concept for solving the apartment question and the master plan are realized in individual segments over a long time frame. It is, therefore, not adequate to recognize them as a basis for work. Every concept includes the resolution of the people's representatives, or the council, coupled with a plan of measures for its implementation. This means that as early as the determination for the long-term concept is made, specific determinations should govern areas of land reserved for future construction.

In Section 7 of the Building Land Law, it is specified that both improved and unimproved land can be identified as reserved areas for construction. As early as the preparation and working out of the long-term municipal construction plan, orientation toward the rational use of areas is provided. In this respect, we can refer to the demands published in Section 6 of the Building Land Law.

With the turn toward municipal construction, the number of dwelling units per location in our Kreis increased. Because of the low number of building stories and the relatively small gaps between buildings, the location numbers per new construction rose. Since we do not regard new construction in an isolated manner, but realize it in a closed area (residential quarter), and since we are realizing reconstruction, modernization, and maintenance operations in addition to new construction, a multiplicity of problems must be solved with respect to private ownership in preparing construction measures.

Without the specific and clear regulation pertaining to the availability of building land, pertaining to regulations for coutilization of this land in preparing and executing building measures, the problems can hardly be mastered.

The Building Land Law has been in effect for a relatively short time. Our existing experiences are limited to questions and problems involved in the preparation and discussion of construction plans and to its utilization in training and directives.

In so doing, value was primarily placed on planned work in location processing. Three work steps were set which must be accomplished with respect to every planning project:

1. Consultation and discussion of the proposal for long-term municipal construction planning at meetings of residents. The results are to be captured in a protocol and are to be worked into the concept.

2. Decision with respect to the concept and the plan of measures to implement the concept:

a) identification of realization phases and sectors,

b) identification of measures for which construction reservation areas have been applied for.

3. Detailed planning and renewed public presentation. Establishment of specific measures to secure the availability of building land as a result of the discussions.

Thus far, in the short time that the Building Land Law has been in force, we have only been able to determine construction density plans in two communities. A useful substantive discussion resulted even despite initial reservations of the citizens who were directly involved. In the smallest towns and villages, we are working close to the skin of the citizens. The positive influence of neighbors with respect to problems must, therefore, never be underestimated.

Imprecise information by a third party is frequently more harmful than the necessity of having to make more precise a long-term item of information on the basis of additional investigations. Consequently, I consider it to be our task to recognize problems with respect to the making of building land available through long-term concepts on the basis of the Building Land Law and to solve them in cooperation with the citizens involved.

The Building Land Law presents us with good opportunities for realizing our construction policy in conjunction with our citizens.

LISTENERS PROVIDED WITH LATEST DEVELOPMENTS IN TRANSPORT SECTOR

DW160745 [Editorial Report] In the third installment of the recorded "Listeners Forum," East Berlin Domestic Service in German at 1600 GMT on 8 January presents Transport Minister Otto Arndt, who answers questions about his ministry. The topics include railroad and street traffic, road construction, inland and deep-sea navigation, civil aviation, the Mitropa travel agency, and the international Deutrans shipping agency. The minister says that roughly 11.5 million people in the GDR now make use of public transportation.

Referring to the electrification of railroad lines, Arndt states that in 1985 almost 300 kilometers were electrified and that this excellent pace will be continued in 1986. "It will require even more effective construction work and a better application of materials," he adds.

In reply to a listener's remark on overcrowded trains at rush hours, Arndt expresses surprise. He says the situation ought to have improved last year owing to the operation of almost 2,000 additional trains. Additional relief to rush-hour commuter traffic is afforded by double-decker buses.

Asked about the prospects for commissioning additional express trains, the minister states that new Intercity Express trains between Berlin and Erfurt are planned as well as a couple of relief trains for the Rennsteig City Express, in both directions. About 15,000 trains run in the GDR each day, the minister notes, with 50 percent of them being passenger trains while the other half are freight trains. "The key problem for all transportation is," the minister points out, "the struggle for absolute punctuality."

Answering a question about the benefits derived from shifting goods transport from road to rail, Arndt says that the major advantages are in saving energy. Continued electrification of the GDR's railroad network, the minister adds, will enable the operation of longer and heavier trains. He notes that "the goal in 1986 is to increase rail container traffic by 72 percent compared with 1981." By the end of the first quarter of 1986, the computer-controlled transportation system will be completed so that transportation means and energy can be saved.

A number of questions deal with the growing demand for motor vehicles and repair and maintenance services. The minister deplores the fact that "the people's demand for repair performances on motor vehicles is not yet fully met by short waiting and repair periods."

Referring to the GDR's inland waterway facilities, Arndt notes that the total number of waterways amounts to roughly 2,300 kilometers and that for the time being no additional waterways are planned. In reply to a listener's question, Arndt says the GDR's icebreaker fleet now numbers about 20 vessels; the sea-going fleet numbers roughly 170. In the GDR ports of Rostock, Wismar, and Stralsund an average of 5,500 ships from many countries are berthed each year. The GDR's annual transshipments amount to roughly 25 million tons of goods.

In conclusion the minister notes some modernization plans for the Berlin subway system and other train stations. He thanks all transport workers for the outstanding results achieved in 1985.

MINISTER RESPONDS TO QUESTIONS ON CONSUMER SERVICES, REPAIRS

DW161400 [Editorial Report] East Berlin Domestic Service in German at 1600 GMT on 9 January 1986 continues its "Listeners' Forum" series with Udo-dieter Wange, GDR minister for the bezirk-administered and foodstuffs industries. Initially the minister makes it clear in response to a question that the statistical data on bezirk economic plan fulfillment include the bezirk-administered combines but never such centrally administered combines as the Buna Works in Halle Bezirk or even the Leuna Chemical Combine.

As to the achievements of the bezirk-administered industry, Wange stresses its "good development," which accounts for a 1985 output "worth more than M20 billion." The envisaged growth rate for 1986 is 8 percent and "the share of the bezirk-administered industry in the production of new consumer goods in 1986 will be 10 percent," he adds.

A listener wishes to know why "supply bottlenecks occur in the thousand little things of daily use." The minister replies: "In most cases it happens when demand increases more rapidly than production capacities. Consequently, for the bezirk-administered industry we have envisaged in the plan a considerable increase in the production of rationalization equipment so that the production branch can adapt to requirements in good time and supply will keep abreast of demand."

Having promised improvements in services in general and a tangible reduction in waiting periods for repairs or their elimination by enhancing the exchange service--turn in a set for repair and take home a spare for the duration--Wange announces that the network of self-service cleaning facilities will be expanded by 50 shops in 1986, the CSSR supplying the required equipment by contract.

A listener from Greifswald wonders whether it will be possible to obtain licenses for private artisan shops in the future. The minister declares: "Yes, of course, albeit in keeping with the requirements for the supply of the people. Last year we granted permission to 15,000 citizens to open, or continue to operate, artisan enterprises." He adds that the local authorities have "clear instructions to exploit all options and especially to guarantee the continuation of an artisan enterprise's operation with the artisan's children and to grant further operating licenses in the interest of the people's supply."

Wange informs a Leipzig listener that the M7.14 billion output of the GDR furniture industry for the people envisaged for 1986 is broken down as follows: Furnishings for about 5,500 bedrooms, 10,200 kitchens, 17,400 rooms for children and youngsters, 12,000 living rooms including upholstered furniture, and more than 4,000 sets of upholstered furniture for replacement purposes. Apart from the built-in kitchens for all the apartments to be newly built in 1986, the furniture industry must equip kindergartens, nurseries, and health facilities, sales outlets, restaurants, and FDGB vacation homes.

When questions shift to the foodstuffs industry in general and soft drink production in particular, Wange announces that there is a host of ideas concerning new products in this field. "Jointly with our Cuban comrades in particular we are in the process of developing new raw substances from plants growing in Cuba, substances which can be utilized for the production of soft drinks." New products will be on sale "before the end of the year."

In conclusion Wange draws attention to the relocation of the "traditional" fishing grounds of the GDR fishing fleet off Norway, saying that in the meantime GDR fishermen have adapted to the new fishing grounds "off northern and southern Africa and in the Indian Ocean, showing good catch results."

BRIEFS

ECONOMIC RELATIONS WITH AUSTRIA--East Berlin (ADN)--On Friday [17 January] State Secretary Dr Gerhard Beil received Dr Erich Schmidt, state secretary in the Austrian Ministry of Trade, Commerce and Industry to discuss the further development of economic relations in 1986. According to Dr Schmidt, Austria will participate with numerous exhibits in the 1986 Leipzig Spring Fair. [Summary] [East Berlin NEUES DEUTSCHLAND in German 18-19 Jan 86 p 2 AU] /8309

ECONOMIC RELATIONS WITH SWITZERLAND--Bern (ADN)--GDR State Secretary Dr Gerhard Beil is currently visiting Switzerland to discuss economic relations between the two countries. He met with Dr Kurt Furgler, the Swiss minister of trade, and with Dr Cornelio Sommaruga, head of the Office of Foreign Trade. It was agreed to give the necessary support for the further development of economic relations. Mutual trade is to be increased and cooperation on third markets is to be developed. [Summary] [East Berlin NEUES DEUTSCHLAND in German 21 Jan 86 p 1 AU] /8309

MEIER MEETS IRAQI MINISTER--East Berlin (ADN)--On Wednesday [8 January] Felix Meier, minister of electrical engineering and electronics, received Tariq Hamad al-'Abdallah, minister of light industries of the Republic of Iraq and chairman of the Iraqi part of the standing committee for economic, scientific, and technological cooperation between the GDR and the Republic of Iraq. The ministers discussed the further development of cooperation between the two countries in the field of electrical engineering and electronics. So far, the GDR has delivered, inter alia, railroad signalling and safety equipment, electronic data processing equipment, and equipment for electric energy transmission and distribution. [Excerpts] [East Berlin NEUES DEUTSCHLAND in German 9 Jan 86 p 2 AU] /8309

GEORGI MEETS IRAQI MINISTER--East Berlin (ADN)--On Thursday [9 January] Dr Rudi Georgi, minister of machine tool and processing machinery building, received Tariq Hamad al-'Abdallah, minister of light industries of the Republic of Iraq and chairman of the Iraqi part of the standing committee for economic, scientific, and technological cooperation between the GDR and the Republic of Iraq. They discussed measures for further developing relations in the field of machine tool and processing machinery building. GDR deliveries to the Arab country include machine tools, printing and textile machinery, and repair shops. [Excerpts] [East Berlin NEUES DEUTSCHLAND in German 10 Jan 86 p 2 AU] /8309

INNOVATORS URGED TO COMPETE FOR TAX CONCESSIONS

Budapest OTLET in Hungarian No 45, 7 Nov 85 p 23

[Interview with Jozsef Kacsoh, Director of NOVIKI, by Anna Gyori: "A Contest For Tax Concessions"; date and place not specified]

[Excerpts] "In the case of a positive judgment, artisans get a 30 percent tax concession."

Nowadays the taxing of artisans and entrepreneurs is almost a daily topic. Even in the columns of the ESTI HIRLAP I noticed an advertised address which dealt with this topic: Bidding For Tax Exemption! With a December 1 deadline, the Office for Small Business Innovations, also known by the imaginative name NOVIKI, awaits the applications of artisans, enterprise work associations, independent work associations, ????? (polgari jogi tarsasagok), and groups of skilled workers from industrial and service-oriented cooperatives.

I turned to the director of NOVIKI, Jozseph Kacsoh.

[Question] How much interest is there and who can count on a decrease in taxes?

[Answer] The notice offers tax concessions to everyone who: makes products dealing with energy conservation and environmental protection and provides services relating to this; manufactures products, perfects innovations, or pursues outstanding craftsmen activities based upon patents granted to independent innovators or those representing firms. Last year there was less interest than what we had expected; only 470 private craftsmen and 155 entrepreneurs applied.

[Question] What is the extent of the potential tax decrease, who can count on it, and how is one's entitlement determined?

[Answer] After making a payment of 500 or 1,000 forints, each artisan or entrepreneur applying with us receives a bidding form. The artisan forwards this document to the county secretariat of the National Organization of Artisans (KIOSZ), where a committee of experts makes a decision, then they forward the form, together with their opinions, to us. NOVIKI also provides a professional opinion, together with which the document is forwarded to the

KIOSZ's central economic department. The final decision is made there, after which everything comes back to us. We notify the artisans, who enclose our notification with their tax statement at the end of the year.

[Question] Isn't doing it this way a little cumbersome?

[Answer] It is indeed. The procedure is simpler with entrepreneurs: They return to us the document we give them, attaching the validation of their claims, and we mail them our professsional evaluation to be attached to the tax statements they send to the Chief Income Administrating Office of the Financial Ministry. In the case of a positive judgment, artisans receive a tax concession of 30 percent. They can also partake of an additional ten percent tax decrease if they are realizing their own invention. Entrepreneurs, on the other hand, can deduct 15 percent of the distributed income from their taxable base income.

[Question] What do you see as the reason why so few applied?

[Answer] The majority of artisans and entrepreneurs do not possess the requisite machinery or equipment to move ahead. Whatever amount the entrepreneurs deposit in an account earmarked for the purchase of machinery, they can deduct from their total income, and this is not taxable.

[Question] In addition to determining tax concessions, you are also involved in management.

[Answer] If somebody turns to us with a good idea, in which we see some possibility and for which there is also a demand in the marketplace, then we financially help in realizing this. For example, one artisan invented a type of casting procedure which was able to make plain bearings. The Hungarian State Railways (MAV) needed this product, which up to this time it had bought for hard currency. As a result of this idea the Hungarian State Railways (MAV) and NOVIKI helped by each assuming 50-50 percent of the risk in the development of this new technology. The artisan who came up with the whole thing will later on teach the MAV employees who are involved with manufacturing products.

[Question] What does NOVIKI profit out of all of this?

[Answer] At its inception the KIOSZ and the State Development Bank guaranteed 4 million forints capital for the office, out of which we spend 1.75 million for management. Naturally it is not only private entrepreneurs who can turn to us, but rather anybody who has a technological development problem. Our primary goal is not to make a profit, but rather to help to get as many new inventions as possible off the ground.

HUNGARY

NEW SYSTEMS FOR TAXING POPULATION INCOME

Budapest FIGYELO in Hungarian No 47, 21 Nov 85 p 19

[Article by Dr Mihaly Kupa: "Changes in The Population's Income Taxation"]

[Text] Beginning with 1986, there is no mention of introducing a system of unified personal income taxation. (Concerning the same topic, see the statement of Deputy Minister of Finances Laszlo Bekesi in FIGYELO No 45, 1985.) Furthermore, the regulations now ratified do not affect the system of taxing agricultural incomes from household plots, the taxes of associations, the contributions to the national health insurance, and the rules concerning sales taxes.

Who Is Affected?

The modification affects approximately 1.2 million citizens, those who have already been paying income taxes. In other words, it concerns private artisans, private merchants, white-collar professional freelancers, members of associations (such as enterprisal economic work associations, specialist groups, and associations that operate on contract or lump-sum bases.) These include about 450,000 citizens; we must add to these the approximately 800,000 individuals who pursue taxable income-producing activities on a part-time or occasional basis (teachers, translators, etc.).

General income tax rates will change so that, beginning with 1986, the contributions for community development (KOFA) will be incorporated in the system, in accordance with the following principles:

--up to 80,000 forints taxable income, the tax rate will remain unchanged (in other words, in this category the taxpayers "gained back" their earlier tax burden).

--at the same time, for taxable incomes between 80,000 and 200,000 forints, the 20 percent community development contribution (KOFA) will be gradually incorporated in the tax-rate.

Finally, in cases of income above 200,000 forints, the tax burden will be relatively heavily (3-8 points) increased.

Two additional pieces of data, in order to evaluate the above: During the first three quarters of 1985, the average annual wage in the state and cooperative sectors was between 64 and 65,000 forints. At the same time, taking into consideration activities that fall in the category of general income taxes, 95-96 percent(!) of private artisans and merchants paid taxes on incomes below 200,000 forints during 1985. Beginning with 1986, the withholdings according to the new tax rates will look like this:

Table I.

Net Tax Base in 1,000 forints	Tax in forints	Percentage	Changes as compared to 1985 burden in forints
40	1,600	4.9	- 320
60	3,600	6.0	- 720
80	7,600	9.5	- 1,520
100	13,600	13.6	- 320
150	36,100	24.1	- 620
200	58,600	29.3	- 920
300	120,600	40.2	+ 1,080
500	270,000	54.1	+ 19,080
1000	656,000	65.6	+ 20,480
1500	1,056,000	70.4	+ 30,480

--Note 1: Net tax base, i.e. the sum remaining after adding up all obligations (e.g. contributions to the national health insurance) and deducting all concessions (e.g. deductible personal expenses).
--Note 2: Income tax for 1985 + 20-percent contribution to community development (KOFA).

In the category that previously paid a 10 percent contribution to community development (associations, lawyers, white-collar professionals), the incorporation of a 20 percent contribution to community development was ameliorated by increasing the amount of tax-free personal and utility expenses.

Resulting from the increase of cost proportions, in 1986 the income and disposable income of various activities will look like this:

Table II.

		Disposable (after-tax) earnings of Private artisans/merchants in 1,000 forints	Members of associations
150	With 1,000	92.5	93.0
200	forints of	112.9	116.3
500	earnings	201.0	227.4

To Stimulate Innovation

Creative intellectuals (writers, artists, and performers) have already been taxed in accordance with a different accounting of expenses. From 1986 their average taxes will be about half of what they paid in 1985. This reflects the desire to continue stimulating interests connected with creativity. The new regulations significantly increase the number of concessions tied to taxable activities and stimulate innovative approaches. To mention only the most important points:

--The so-called social exemption (based on age, handicapped status, or private activties as artisans or merchants) was increased from 48 to 60,000 forints.

--In locations where public utilities are not available, the concession allowable by the local councils has been increased from 50 to 120,000 forints, and at the same time it is now applicable to all small enterprises.

--Taxes paid for workers employed by private artisans, retail merchandising, and small enterprises have been reduced from 20 to 10 percent.

--Each year, 70,000 forints tax exemption per person can be claimed for innovations and patents. At the same time, in order to stimulate innovation, the tax concessions of small enterprises implementing new technologies and patents have also been increased.

New Methods

There have been significant changes in the methods of taxation. As of 1986, small enterprises will pay taxes in the following three ways:

--Thosewho possess more significant incomes will shift to the so-called self-taxation (which is similar to the method now used in connection with the enterprisal economic work associations). Private artisans having sales in excess of 2 million forints, private merchants having sales in excess of 8 million forints (but, in both cases, having more than 500,000 forints of taxable income) will shift from today's practice of tax-levying to self-taxation. In other words, those falling into these categories will compute their own taxes and pay them without any notification, with stricter bookkeeping requirements (dated record books, bank accounts, etc.) than presently applied. In these categories, the taxing authorities will perform audits only.

--Below the 500,000 forint income level, citizens can choose betweeen the traditional procedure of tax-reporting or the new type lump sum taxing method. (There will be no change in the traditional procedure.) The substance of lump sum taxing is this: taxes will not be paid on the basis of earnings, but on the basis of receipts, and tax rates will be determined three years in advance. The determination of lump sum tax amount will take place in negotiations between the taxpayers and the taxing authorities, with the agreement of citizens' interest groups. We will institute eight lump sum classes, with three tax categories--low, medium and high--in each class. While the tax amounts are higher than those that appear in the new table of tax rates, on the one hand they provide a three-year security for the taxpayers, and on the other hand they enable the taxpayers to manipulate their investments in such a manner that their incomes increase in any given receipt category--without paying taxes on such a surplus. (Naturally, significant changes in receipts--decreases or increases--must be reported to the authorities, who will continue to exercise suitable control in the future.)

--While it is not a part of the changes in the taxation system, another important new regulation states that as of 1 July 1986 the 10 percent fee payable in connection with the transfer in ownership of automobiles received from abroad (as a gift or the like) will be discontinued. In accordance with the new rule, an income tax for 50 percent of the customs value of the motor vehicle (any motor vehicle) must be paid, if its ownership is transferred (it is sold). (Until now, 60,000 forints had to be paid at the time of selling a Mercedes that has a customs value of 600,000 forints; in accordance with the new rule, this fee will become 120,000 forints.)

Different Apparatus

Beginning with the second half of 1986, there will be organizational changes as well: the taxing apparatus of the local councils will take over responsibility for the taxation of private artisans and merchants. The discontinued tax offices will operate as offices determining the tax rates, attached to the councils, in Budapest and in the county seats, while tax- and fee-offices will operate in the county towns. The procedure for levying the taxes will not change (the taxing of private artisans and merchants will be the task of county offices determining taxes).

In order to more effectively discover and tax the so-called "black incomes," a special section will be established which, in cooperation with the responsible organs, will significantly improve the speed and efficiency of control.

These modifications taking effect in 1986 are once again indicating that in the long run our economic leadership regards small enterprises as useful and respected members of our socio-economic life.

STATISTICAL BUREAU REPORT ON PRODUCTION, EXPORT

Budapest FIGYELO in Hungarian No 47, 21 Nov 85 p 19

[Unsigned article: "The Central Statistical Bureau (KSH) Reports: Industrial Production Barely Increased, Export Significantly Decreased "]

[Text] During the first three quarters of the year, the production of industrial firms was 1.1 percent higher than a year before. Among the most important branches, the chemical industry increased its production by 3.6 percent, and the machine industry by 3.4 percent. Mining productivity slightly surpassed, while those of the food processing and light industries approached the level for January-September of 1984. In metallurgy and in the manufacturing of construction materials the production level decreased.

The level of export sales for industrial commodities, which fell below the 1984 level during the first six months, exhibited an 8.4 percent growth during the third quarter, and thus for the nine-month period it exceeded by 2.1 percent the level of the previous year. The volume of domestic sales rose by 1 percent.

As for agricultural goods, the volume of sales of crop-cultivating and gardening products combined was 3.4 percent lower than during the first three quarters of the previous year. However, in vegetables and fruits the volume of sales has increased. They sold 2.2 percent more beef, 2.8 percent more sheep, and the same amount of poultry as last year. The purchasing of pork and meat products lagged behind that of the previous year.

Activity by the contract-based construction enterprises, which accomplish about half of the building and equipment installation tasks, was 8.7 percent below the level during the same period of the previous year, attributable in part to unfavorable weather conditions during the early part of the year, limitations placed on energy consumption, and reductions in the investment budget.

During the nine months there was 2.6 percent less money allocated for investment by the socialist sector than in the previous year. (During the third quarter of this year, investment activity became more lively, primarily on the enterprisal level.) Construction investments decreased during the first three quarters. The volume of investment spent on machinery, due to significantly increased machinery purchases outside the ruble-based economies, has surpassed the level of the previous year by 2 percent.

The population's income derived from central sources was 8.4 percent higher than during the same period of the previous year. Within this category, the wages of workers and employees have grown by 6.7 percent. In manufacturing industries, wages increased by 8.5 percent, in the construction industry by 6.4 percent. The population obtained 0.8 percent more income from the sale of agricultural goods than during the previous year.

The volume of retail sales showed an increase of 7.1 percent in current prices; adjusting for price-increases, this means a 1 percent increase. The volume of trade has grown by 1.6 percent in foodstuffs and luxury consumables, and by 1.4 percent in miscellaneous industrial articles; while in clothing items it has decreased by 3.3 percent.

Figuring in current prices, the level of import showed 7.0 percent, while the forint value of export a 1.6 percent increase over that of January through September of last year. The foreign trade balance for the period of January through September (taking into consideration the actual freight costs) closed with a 5 billion forint deficit.

PROPOSAL TO AID DISADVANTAGED AGRICULTURAL COOPS

Budapest FIGYELO in Hungarian No 1, 2 Jan 86 p 13

[Interview with Dr Sandor Misi, director of the Cooperatives and Business Administration Affairs Main Department of the Ministry of Agriculture and Food, by FIGYELO agricultural affairs staffer Peter Bonyhadi: "Rescue Attempt"; date and place of interview not given; first three paragraphs are FIGYELO introduction; boxed material by author as indicated]

[Text] Living conditions and the production level in seven megyes--Borsod, Szabolcs, Bekes, Vas, Zala, Somogy, and Baranya--are lagging so far behind the national averages that they are causing tension practically of nationwide proportions.

In spite of the fact that agricultural policy is devoting special attention to the situation of the large-scale farms operating under below-average natural and economic conditions, farming in the mentioned regions is unable to ensure the conditions of even simple reproduction, and the means of providing profitable employment are lacking almost completely.

Peter Bonyhadi of our staff has interviewed Dr Sandor Misi, director of the Cooperatives Main Department within the Ministry of Agriculture and Food, about the causes of this situation and the possibilities of solving it.

No Common Denominator

[Answer] By way of introduction I should perhaps point out merely that general regulations for aiding agriculture are unsuitable for taking into consideration unfavorable factors other than soil quality, such as, e.g., the threat of floods and poor drainage, a production structure based on regional traditions, a dissipated infrastructure of poor quality, the absence of industries, the demand for more jobs than what the region is able to support, etc.

Therefore the large-scale farms operating under such conditions have been lagging in their development, and the financial difficulties in their operations have become constant. There are in all between 140 and 160 such large-scale farms, farming on over 500,000 hectares, which is 13 to 15 percent of Hungary's total area of farmland. These farms account for 32 to 40 percent of the output of the cooperative farms in their respective megyes.

The overwhelming majority of these cooperative farms are disadvantaged. The cadastral value of the plowland on most of them is below 17 [Austro-Hungarian] gold crowns. Their capital-labor and working capital ratios are low. They are coping with constant shortages of experts. And their ability to assume risk is minimal.

Nearly three-fourths of the financial deficit during the past 10 years is concentrated in these regions. The farms' yearend losses and fund deficits that the state budget has absorbed total close to 6.0 billion forints. A 1979 joint decree of the Ministry of Finance and the Ministry of Agriculture and Food prevented a further deterioration of the situation. It is actually a comprehensive package of measures, with a price tag of 1.0 billion forints, embracing the entire production process.

[Question] You mentioned that many kinds of unfavorable factors are hampering these cooperatives. It is indeed impossible to draft special regulations that take so many different aspects into consideration, respectively their application alone would be unable to produce a lasting result. Therefore what is basically common that could be changed with the aid of economic instruments?

[Answer] It is impossible to find a common denominator. In a substantial proportion of the cooperatives farming in these regions, the production structure that has evolved by tradition is the source of serious losses under the present system of economic regulation. Indispensable amelioration, which in many cases would mean merely simple drainage, has been neglected or considerably delayed practically everywhere in these regions, because the agricultural cooperatives are strapped for cash. Yet not even the price of the seed can be recovered on fields that are threatened by floods or have poor drainage.

Costly Small Businesses

Cattle and sheep determine the livestock production of the disadvantaged farms, but the profitability of these branches of livestock production is below the national average to begin with. The development of industrial activity and services in these regions began late and in the wrong direction. For example, the small businesses established primarily in the capital did nothing to relieve the problems of local unemployment. Because of the distance and the difficulty of supervision, moreover, several of these small businesses ran up substantial losses for their parent agricultural cooperatives.

The obsolete stock of fixed assets and working capital that is geared to the one-sided production structure, and the backward infrastructure in the small villages do not attract agricultural experts. And the recurring failure is conducive neither to pledges of increased performance, nor to labor discipline.

[Question] The argument is familiar that the country cannot afford to dispense with the farm output of these regions where the conditions of farming are unfavorable. For local economic managers, however, the prospect of showing a loss year after year, and of accepting all the personal consequences of unprofitable operation, is not the brightest one, either. What is there new that you could say in this situation?

[Answer] I do not think that we have to invent anything new in these regions. We merely ought to achieve--and imagine this "merely" in quotation marks--that farm production does not show a loss when weather conditions are approximately optimal, and that industrial and service activity of acceptable profitability supplements farming. The most important thing in this region is to set up--in a differentiated manner, of course--economical production, instead of the one-sided quantitative increase of the output. For example, crop production is typical in the disadvantaged regions, with the exception of Borsod Megye; but the rationalization of land use, an essential condition for profitable farming, has not been solved as yet.

We ought to afforest at least 6,500 to 7,000 hectares in these regions under the 7th Five-Year Plan. The area of plowland used to grow forage crops could be reduced by establishing or renewing about 4,000 hectares of grasslands. And between 10,000 and 11,000 hectares more ought to be sown with grass to conserve the soil. In five to ten years, about 1.0 billion forints ought to be spent on these projects.

The threat of floods and the poor drainage in these regions ought to be reduced to a minimum, which would cost--at today's prices--a total of nearly 6.0 billion forints under the 7th and 8th Five-Year Plans.

Paper Wealth

[Question] After five to ten years, then, the farms would be able to do what they like on these areas?

[Answer] No! Not even the farms are capable of miracles. Disposition of the area under crops would have to be changed. Instead of corn that does not thrive because of the weather conditions, for example, preference ought to be given to cereals. The area of forage crops freed by the aforementioned grasslands ought to be used to grow industrial crops--sunflower, soybeans, hemp, etc.--provided we are able to develop a suitable system of machinery and implements for them.

[Question] Actually this solution does not require much foresight and planning if the money for it is available. Once you have established the necessary technical base, you only need to operate it.

[Answer] All the same, this is not so simple. Because of the smaller area per farm, for example, the replacement and repairing of crop production's stock of machinery should be solved jointly, within the framework of joint operation, rather than separately by farms. First, because this way the farms could find it easier to come up with the approximately 2.0 billion forints for the investments this would require. And secondly, it would be easier to take advantage of the automatic subsidies and other state aid for the procurement of farm machinery.

[Question] Would it not be possible to achieve faster growth by modifying the structure of livestock production?

[Answer] That, too, must be based on crop production. Incidentally, livestock production in the lagging regions is characterized by herds of heterogeneous quality, wide variations in the acreage per farm, and differences in the technological level and animal-husbandry practices.

Almost without exception, the buildings used to house the livestock were built in the 1968-1973 period. Sheep are housed mostly in makeshift shelters. There is hardly any machinery for the reliable production of good-quality fodder, and therefore the utilization of fodder is inefficient. There is a wide discrepancy between the book value and the actual value of the livestock, and this inflates the stock of working capital, respectively the value of the farms' assets.

In view of the existing conditions, the most important task is not a change in the structure of livestock production--after all, the regions in question are suitable primarily for raising cattle and sheep--but the upgrading of the breeding stock, modernization of the technologies of keep, and the ensuring of a suitable supply of feed and fodder. The system of economic regulation for 1986 also encourages these efforts, especially in cattle breeding.

[Question] In these regions, I suppose, it is not always possible to think in terms of large-scale farms of customary size. Would it not accelerate the development of these regions if we were to provide for their household plots, and for small-scale farming, incentives that differ from the average ones?

Economical Small-Scale Production

[Answer] In my opinion, there is no need to establish some kind of special zone. But contractual relations between the large-scale farms and the small-scale producers in the regions ought to be expanded further. And the large-scale farms ought to resort more boldly to the practice of letting small-scale producers operate certain branches of their farming, but without changes in the form of ownership.

[Question] After the unfavorable experience to date and under the given conditions, what are you planning to do with the cooperative farms' ancillary activities?

[Answer] Due to differences in local conditions, the requirements for the development of industrial activity and services likewise differ in the individual districts that are included in the program for the development of regions and settlements. In view of agriculture's limited ability to create jobs, and of the pressure to provide employment, among the megyes in question there will be a need for local, nonagricultural businesses, employing mainly semiskilled labor, primarily in Szabolcs and Borsod.

It will be necessary to investigate what opportunities there are in these regions for improving the profitability of the farms' principal activity. These opportunities should include, among other things, also the expansion of food processing or preprocessing.

First Round

[Question] Presented this way, your argumentation is very impressive. But it would be even more effective if you could tell us in somewhat greater detail, for example, where and what the farms could do.

[Answer] In the Szatmar and Bereg region, the farms could create jobs by establishing or expanding plants for crushing limestone, utilizing the gravel deposits and flared gas. In several regions, the expansion of cottage industries could come into consideration. In the Zahony area, the solution could be participation in supplying the reloading district's manpower demand on the basis of cooperation, and the processing of imported timber. In Nyirlugos and the Vallaj-Merk area, the cooperative farms ought to form associations for processing farm products. On most large-scale farms there are opportunities to engage in the production of general metal goods, plastic and other household products, and products of the supplier industries.

Some of the mentioned development projects could begin already in 1986, with aid from central resources. The managers of all the farms concerned will be informed soon about the program's other ways and means, including opportunities to submit tenders, the generally applicable and special grants and subsidies, and credit terms.

[Question] What can we expect of this program that will cost several tens of billions of forints?

[Answer] The specific results of the program's implementation will depend primarily on the amount of resources that can be made available, on the scale of the applicable preferences, and on the production and human-engineering factors. In the present state of the program's elaboration, a solid answer to your question is not possible, but the main results can be outlined.

The branch program's realization will enhance the more efficient utilization of the country's backward regions, and their participation in the mainstream of Hungary's economic and social life. It will increase the regions' ability to provide jobs and will eventually permit the curtailment or phaseout of state subsidies. With changes in the production structure, the level of production on the farms in question could improve by about 20 to 25 percent.

[Box, p 13]

Peter Bonyhadi: Potential of Cooperative Trucking Underexploited

I am not bringing this up because the agricultural cooperatives are in any particular need of protection from small businesses. After all, the integrational relations between the household plots and the large-scale farms prove the exact opposite. Indeed, one could perhaps venture the opinion that a large-scale farm might even find it stimulating if small-scale producers or small entrepreneurs forced it to compete, to really compete, in some activity.

Up to now it has been customary to mention real competition always on behalf of small-scale producers and small entrepreneurs. Because the large-scale farms, with their more extensive system of relationships, have found it easy to create a situation such that their small competitors have already been glad even to avoid having to competing with them.

But there is one area of competition within agriculture where the bigger competitor, the large-scale farm, starts with a handicap. And that area is trucking!

Here the point is not that private truckers in the provinces are more polite than the truck drivers of the cooperative farms. Nor that private truckers consider it natural to provide services of which cooperative-farm trucking has never even heard. The less so because the incentive system of the cooperative farms stimulates also their truck drivers to solicit as much business as they can, and to keep fuel costs as low as possible, to the mutual advantage of the cooperatives and their truckers. And this is specifically where the agricultural cooperatives' trucking fleet falls hopelessly behind the rural private truckers.

For private individuals, and hence also the household plots, are able to buy heating oil for much less than what the large-scale farms pay for the same grade of light but desulfurized heating oil, also known as diesel fuel. So far so good. But the trouble is that at the fuel pump it is impossible to tell where the oil being filled into jerry cans will end up eventually, whether in the stoves or in the tanks of private trucks. To begin with, provincial private truckers are thus able to offer their services for 30 percent less than what the trucking service of a cooperative farm would have to charge for the same cargo to the same destination. Once the autumn hauling for the farms has been completed, for example, the trucks of the Bekes Megye agricultural cooperatives are standing idle in the yard next to the repair shop, or parked in the street in front of the truck drivers' homes, because there is no cargo to haul.

At first glance this is only natural. After all, nobody will be willing to pay 30 percent more to have his building materials trucked in, or his fattened livestock hauled away, merely to support a socialist large-scale farm's trucking service.

But it is an entirely different question how disadvantageous it is from the economic point of view if in agriculture, which otherwise is coping constantly with transportation problems, the available transportation capacity is not fully utilized, due to a difference in fuel prices. Merely because there is no hesitation to fill up the tank of one truck with cheaper household fuel oil, while the other truck runs on more expensive diesel fuel.

Of course, raising the price of household fuel oil is not the solution! Equal conditions in the competition must not be ensured for the agricultural cooperatives' trucks at the expense of the rural residents who use fuel oil to heat their homes and do their cooking. All that is required is that the possibility of procuring fuel for 30 percent less be taken into consideration when assessing the private truckers' taxes.

SITUATION OF CONSUMER GOODS SUPPLY, TOURISM DESCRIBED

Budapest NEPSZABADSAG in Hungarian 14 Dec 85 p 5

[Interview with Minister of Domestic Trade Zoltan Juhar by Csaba Egerszegi]

[Text] Tomorrow will be Silver Sunday [second Sunday before Christmas], and in about a week and a half it will be Christmas. The year-end seasonal shopping spree is reaching its peak in the outlets and department stores. Some people leave these places satisfied, others are irritated, and their opinions concerning merchandising, the supply of goods and shopping conditions will be formed accordingly. Consumers are never indifferent as to what they spend their money on and what they receive for it, nor is it irrelevant to them how they are treated by those standing behind the counters. "How are commerce and tourism able to fulfill their functions?" is the topic of our conversation with Zoltan Juhar, Minister of Domestic Trade.

[Question] How does the holder of this portfolio judge this year's supply of goods?

[Answer] First of all, I would like to emphasize that we preserved the global coordination between the purchasing power of the populace and the stock of goods. This year's supply of goods--with the exception of heating fuels--basically corresponded to the demands of the national plan. The food supply continues to be good and on the whole balanced, reflecting the accomplishment of our agriculture and food processing industry, which have been judged favorably even on the international scale. Throughout the year, there was plenty of the most important foodstuffs (flour, sugar, milk). The offering in meats and meat products is adequate, and there has been an improvement in the selection of less expensive meat products. The trade in poultry increased by 10 percent. The supply of healthy low-fat milk and dairy products has been enlarged. We succeeded in producing plenty of potatoes, vegetables and fruits, and offered it to the consumer for prices that were lower than expected.

Shortages Occurred, Too

There were also shortages of some products. There was not enough sunflower seed oil, prior to the processing of the new crop there was a shortage of spice paprika, and there was not enough processed milk either.

Compared to last year, the stores had improved their stock of clothing articles. This is illustrated by the volume of trade, which has increased during the past few months. Selection improved in hosiery items, warm-up suits and baby clothes. In other items (draperies, upholstery products) there were signs of over-supply. It should also be mentioned here that, due to the limited import opportunities, it was impossible to satisfy all demands for several fashion articles. The supply of industrial goods--with the exception of solid fuels--is somewhat better than it was last year. In building materials, the balance between supply and demand has been reestablished. In spite of more dynamic merchandising efforts, we have not succeeded in satisfying demands for some household appliances (color televisions, refrigerators, freezers). We imported the same number of automobiles as during the previous year, so the waiting period, especially for the much sought-after Ladas and Skodas, has not been reduced. On the other hand, buyers receive their Trabants or Wartburgs within a year of making their payments.

Will There Be Enough Heating Fuel?

[Question] During the recent past, the population was most aggravated by the shortage of coal. What can we expect in the future? Will there be enough heating fuel in the yards?

[Answer] Since last winter, the government has introduced several measures to solve the problems caused by the shortage of solid fuels. The mining industry made sacrifices to make up for its past delays, and this year delivered on schedule. We also imported about 800,000 tons of fuel above the planned quantity; this is arriving according to schedule, so that the shortage will be gradually reduced. We have already reached the point where the fuel-yards always have some kind of heating fuel available, although there are shortages of certain sought-after quality domestic and import coals. Based upon our preparations for the next year, we feel that the trend of improvement is permanent.

The changing market conditions call for merchandising methods different from our past practices. We have made sure that, even before the winter season, the population would be able to purchase some kind of coal, and provided a one or two-month supply for institutions (schools, hospitals), making sure that those will be able to gradually replenish their stock. We also introduced the practice of lay-away purchasing of fuels, providing a sense of security for everyone.

The fuel-supply stores honored most of the fuel coupons issued by the trade unions (SZOT), and we hope that before the end of the year we can satisfy every waiting consumer, even if we are unable to provide the type of coal desired.

[Question] What is the ministry doing in order to alleviate the permanent, and annually re-occurring, shortages of industrial goods (color televisions, large refrigerators, water heaters, freezers)?

[Answer] As for the purchase of the items you listed, our country has also reached a stage of generational change. This explains why there has been an explosive increase in the popular demand for these during the past few years. These products of our industries, however, are also popular on the global market. Our problem is that, due to lack of production capacity, our manufacturers cannot simultaneously satisfy the demands of domestic and foreign markets. In the longer run, only the broadening of production capacities could bring a satisfactory solution to this problem. In the meanwhile, domestic merchandising attempts to improve the supply of such appliances by importing them. For example, we are purchasing automatic washing machines from the GDR and from Czechoslovakia, and refrigerators from the Soviet Union. Using the methods of direct barter, domestic merchandising enterprises and cooperatives obtain a large amount of manufactured products (such as Grundig color television sets, Siemens freezers, Gorenje refrigerators) as well as television picture tubes to be used in domestic manufacture, and this lessens the shortage. For example, this year one and a half times as many color television sets and 60 percent more freezers reached the stores than last year. At the same time, the growing demands for modern products caution us to prepare for the proliferation of new items (video recorders, personal computers) in consultation with the interested parties and exercising more foresight.

[Question] What is this year's trend in the import of consumer articles? Will the items obtained through barter serve to increase prices, and how much?

[Answer] As of now, about 15 percent of the goods in domestic commerce are imported. The products purchased abroad serve to satisfy our basic needs, since most of them are not manufactured, or are not manufactured in large enough quantity, or--due to natural circumstances--cannot be cultivated in this country (sewing machines, automobiles, citrus fruits, coffee, tea). There are times when the quantity of import cannot be increased to the level desired, either because of external trade circumstances or the lack of suitable sources. As a result, contrary to our desires, imports became less instrumental in stimulating domestic industries to modernize and follow the fashions.

We purchase a larger share of products from our socialist partners. Nearly 70 percent of the rubel-accountable import is based on international agreements. The direct barter trade of domestic merchandisers and cooperatives, which is increasing each year, is becoming more and more important. Due to various configurations--such as trade along the borders, the weeks dedicated by department stores to the goods of certain nations, or the contacts between sister cities--the selection and the volume of trade along the borders has come to constitute about 30 percent of import from socialist countries, as opposed to the earlier share of 8-10 percent.

Import from the non-rubel accountable areas has increased by a total of 2 percent. Looking at the shop windows, the shortage of goods imported from capitalist countries is not apparent. The reason for this is that our merchandising makes more effective use of opportunities for Western imports. Each year, new international cooperative arrangements are put into effect, through which popular brand-name products reach the domestic market. The import of Olympos citrus juices, Fa deodorants, Nestle's coffee and cocoa products, Felina and Triumph lingerie and swimwear, Lee Cooper, Levi Strauss, Wrangler and Adidas clothing items are examples of such arrangements. Taken together, the price level of imported goods is rising more slowly than that of domestic products. According to the latest statistics of the Central Statistical Ofice (KSH), as of the end of September, the price of appliances purchased abroad rose by 3.3 percent as compared to last year, while the price of domestically manufactured goods rose by 6.7 percent. In the category of clothing items, the price increase of imported items is 2 percent lower than that of domestic goods.

Our Foodstuff Commerce In Difficult Situation

[Question] We can be proud of our supply of foodstuffs, but, regrettably, the merchandising of foodstuffs is facing increasing difficulties; what is more, the closing of several hundred food-stores implies that the situation is becoming desperate. Tensions are particularly high in the capital city. What suggestions does the ministry have for the solution of the problems?

[Answer] The situation of domestic foodstuff merchandising is not only an economic issue, but also one of politics. Valid consumer demands are increasing. It is natural that consumers wish to purchase their daily necessities under civilized circumstances, in stores that are open in accordance with popular desires. The reason for having most of our problems in Budapest and in the city's environs is the less profitable nature of foodstuff merchandising, as compared to other branches of commerce. In this field, only 1.8-2 of every 100 forints can be considered as profit, while in other areas of commerce profits are around 3-4 forints. Even if we take the governmental subsidies into consideration, in foodstuff merchandising the profit margin has barely changed during recent years. At the same time, certain costs (energy, the price of packaging) have increased, regardless of the economizing measures taken by the enterprises. Thus, the proportion of profits in these fields has decreased. This meant that there was no opportunity for increasing selection to accommodate the demand of the customers, for mechanization, or for the improvement of remuneration. All of these factors led to the deterioration of technological standards and, especially in Budapest, to labor shortage.

The key to improving conditions in merchandising over the long run is the creation of increased profit margin. The government agrees with us in this question, and this is illustrated by the fact that during 1986 the level of profit margins in the retail of foodstuffs will increase by almost a half a percent, primarily at the expense of the national budget. Within two or three years we will atempt to further raise this level. In addition, the state gives various concessions to the food industry, in an attempt to stop the unfavorable trends and improve the circumstances of shopping.

Progress With Contradictions

[Question] Can we expect improvements in shopping conditions and the technical equipment of merchandising to be more rapid in the future than they are now?

[Answer] During the period of the Sixth Five Year Plan the network of stores increased more rapidly than planned, in order to keep pace with the increasing demand. In the cities and in the capitals of counties, state and cooperative department stores have been built according to plans. As a result of this, modern shopping centers have been created in Budapest, and these relieve the pressure on the downtown area.

There has also been progress in the supplying of smaller communities. The consumer cooperatives continue to develop the network of merchandising outlets in these localities, in accordance with the plan, and enjoying the support of the National Federation of Cooperatives (SZOVOSZ). However, state and private merchandising must also become increasingly involved in the supplying of these areas.

As for the mechanical and technical standards of merchandising, progress is slower than desired. True, the number of cash registers and refrigerators has doubled during the last decade, but there is still a need for more cash registers and modern scales. At the present time, only 800 electronic cash registers and 500 electronic scales operate in 17,400 food stores. In the near future, we would like to make further progress in these areas, too.

[Question] With the proliferation of stores operated by private individuals on a contract (sublease) basis, does the protection of the customers' interests suffer?

[Answer] Experience shows that the new operational forms have proven themselves in merchandising. They improved the supply of goods and the conditions of shopping, while also contributing to an increase in enterprisal and budgetary receipts. As of today, 32 percent of the retail merchandising network operates in this fashion, and these outlets make 30 percent of all sales. In this area as well, the Ministry devotes great attention to protecting the interests of consumers. Until now, our spot checks have shown that direct financial injury to the customer is less serious in the stores operated by contractors than in the traditional outlets. In test purchases made last year, the proportion of protested items was 17.4 percent, while the national average is 24 percent. Some of the irregularities result from a lack of information on the part of the store operators. Therefore, in addition to the continued control and calling to account, we must also devote more attention to the continuing education of employees in this area.

Our Tourism Had A Good Year

[Question] Let us switch to the issue of tourism: In your opinion, how could the past year be evaluated, how did our income in this area develop?

[Answer] Our tourism had a good period last year. There has been increased interest in our country, both on the part of socialist and Western countries. Our hard currency income developed according to our plans. The number of foreign visitors is growing by 13-14 percent, and now approaches 15 million. Interest in our country continues to grow among the countries of the CMEA. The number of arrivals is expected to be 10-10.5 million, or 1-1.5 million more than last year. This increase is primarily attributable to the broadening of tourism in Czechoslovakia, and it is related to the change in the korona-forint exchange rate. This year, approximately 4 million Hungarian citizens will travel to the other CMEA countries, which--with the exception of Czechoslovakia--roughly equals the average of the previous years. The demand for trips to Czechoslovakia decreased somewhat, due to the previously mentioned changes in the rate of exchange. Our touristic contacts with Yugoslavia have grown significantly; the number of visitors from that country and the number of Hungarian tourists travelling there have increased by 14 and 30 percent, respectively.

We expect nearly 4 million visitors from Western countries, which is 6-7 percent more then during the previous year. During the first ten months our hard currency income (figuring in dollars) has increased by 5.5 percent. In light of this, we expect to reach a 6-7 percent annual growth rate, which equals 280-285 million dollars. On the other hand, we are troubled by the fact that the amount of income per days spent by tourists in Hungary has decreased. As for Hungarians visiting Western countries, we expect 760-770,000 such travellers, which exceeds the figure of the previous year by 20-22 percent. There has been a particularly sharp rise in interest toward shorter shopping trips.

[Question] During recent years, a series of hotels and other facilities have been built with the aid of Austrian loans, and several older facilities have been renovated. Will these investments be justified?

[Answer] During 1985 the number of so-called commercially usable rooms has increased by 30,000 from the previous year. Nearly 3,000 new, or renovated, hotel spaces were at the disposal of guests. The number of privately owned and registered guest rooms has increased by 27,000, and the state's income derived from taxing these facilities has also increased. The results indicate that the regulation of private registered guest rooms, introduced two years ago, has proven itself to be successful.

The projects undertaken as part of the credit agreements between Hungary and Austria will be completed this year. The technical and management experiences of the new hotels are favorable. Their average annual occupancy rate is around 70 percent, and 85 percent of their guests are from Western countries. As a consequence, these hotels will meet, or even exceed somewhat, their loan-servicing responsibilities during this year. Thus, our capacity to receive tourists has significantly increased, especially when it comes to luxury hotels. Our future tasks include, in addition to the renovation of hotels, the development of medium-priced facilities, and the creation of cheaper dwelling units, campgrounds and cabins.

Domestic Tourism

[Question] In your opinion, how much progress have we made in the development of domestic tourism? What hinders further progress here?

[Answer] The development of domestic travel continues to be one of the great tasks of our tourist industry. Under present economic conditions, we must concentrate primarily on the broadening of vacationing and excursion opportunities that are geared to satisfy the more modest demands. For the purposes of touring the countryside, there are more than 1,800 dwelling units in 95 communities at the disposal of domestic travellers. By the end of this year there will be 2,000 spaces in the resort cooperatives Travel agencies and transportation firms alike concentrate on developing their less expensive programs and services. Just recently the Hungarian Association of Hotels published a pamphlet, offering 50-60 percent reductions at 90 hotels during the pre- and post-season periods. These programs are also aided by the fare reductions offered by the Hungarian National Railroads and Volan [bus company].

During the coming years we expect modest increases in domestic tourism, because demands in this area are influenced by real incomes and the cost of travel. In the improvement of offerings (dwellings, programs) we propose greater participation by the enterprises in the local councils, as well as by private enterprises. We also consider the development of inexpensive dwelling opportunities as one of our tasks.

[Question] The period of the Sixth Five Year Plan will end in December. How did the objectives of Hungarian tourism develop during the duration of the Plan?

[Answer] In accordance with our plans, the structure of our tourism has changed; the share of Western countries grew in travel as well as in the amount of earnings. As for the CMEA countries, the surplus income from tourism multiplied by one and a half times by the end of the period (to amount to 210-220 million convertible rubels, while the actual number of travellers has not changed significantly since 1980. Our earnings from the tourism of CMEA travellers during the duration of the plan will add up to 1.4 billion convertible rubels, of which 900 million is surplus income.

The number of those who arrive from Western countries has doubled, exceeding our plans. Our hard currency earnings have grown by 60 percent, and in the period of five years added up to 1.3 billion dollars. During the same period the number of Hungarians travelling to Western countries has increased by one and a half times.

[Question] Once again, we are facing multiple holidays: How did the profession prepare for the peak period in food shopping?

[Answer] Merchandising, together with all involved institutions, began to prepare for the year-end holiday season in time. We made sure that the supply of all basic foodstuffs would be plentiful. In order to assure a good supply of bread, merchandising and the bakeries utilized extraordinary reserves. Naturally, this also means that there will be more pre-baked and bread with preservatives in the stores. The supply of meats and meat products will equal the good standards that came to be expected during the previous years. There will be 3-4 percent more freshly cut meat, and 15 percent more poultry in the stores. In order to provide the traditional holiday meals, there will be plenty of turkey, pig knuckles and sausage. The quantity of fish will be similar to what was available last year.

Once again this year, the temporary holiday stores (such as the Golden Gate and the Gift Centers, etc.) have opened in the capital city and in the larger towns. Shopping will be made easier by the fact that from the middle of December the appliance stores of Budapest and the larger towns will have longer hours of operation. We also made sure that during the days immediately before the holidays the operating hours of larger outlets, markets and stores be in closer harmony with the demands of the customers.

[Question] Thank you for the conversation.

PARTY'S EFFORTS TO KEEP CLOSE TIES TO MASSES EVALUATED

Tirana ZERI I POPULLIT in Albanian 25 Dec 85 pp 3, 4

[Article by Muharrem Xhafa, chief of education sector in CC of AWP: "A Broader Conception and a More Creative and Effective Realization of Ties With the Masses"]

[Text] Ties with the masses have always been an important matter and have continually occupied a special place in the activities of the party organs and basic organizations and of their levers. But under present conditions, it is necessary that these should be conceived more broadly and that they should be more effective and organized and better realized in practice, in the struggle against manifestations of bureaucracy, officialism and formalism, which lead to the separation of the communists and cadres from the masses and to the weakening of ties with them.

A broader vision in this area as well was opened to the party, the organs of authority and the economy, the mass organizations and the whole people by the very valuable instructions and advice given by Comrade Ramiz Alia during his visits to several districts of the country. In the first place, there is now a strikingly great appreciation of and concern with going to the grassroots and there are more efforts to ensure more vital and effective ties and encounters with the working masses by means of various forms. The cadres in the central organs and in districts have been going more to enterprises and agricultural cooperatives, to schools and military units. But the number of days which the cadres spend at the grassroots marks, so to speak, an achievement and is only an index of improvements which are being made. The important fact is that the ties between the party committees, the state organs and organisms and the social organizations and the workers and cooperativists, soldiers, pupils and students are being continually broadened. They are not limited to participation in seminars, meetings and analyses of party bureaus and organizations or mass organization councils and forums. They are also being realized through other activities: direct meetings in fields and production workshops, leisure activities, individual consultations and discussions with artists and specialists, often outside official environments, as well as through joint work, especially in recent months, with workers and cooperativists and in voluntary actions and work.

Ties with the masses constitute a great matter of content and principle, and they have a deep revolutionary significance. They are in no way an aim in themselves and cannot be limited to a few physical meetings and measured by the number of days spent by cadres at the grassroots or the number of people with whom they meet. The urgency of the work as a whole and, in this area, the closest connection of the communists and cadres with the masses involves the party's requirement that we should have a better and more timely knowledge of their problems and troubles, their thoughts and observations on work and people, and that action should be taken so that they find the required solutions in the appropriate time. If, for example, there is damage to socialist property, if foreign manifestations occur, particularly among youth, if a considerable number of pupils and students are kept behind every school year and absent themselves from school, if there are cases in art and literature, in the press organs, in radio and television, etc., where the life and vigor which have been expended in the bosom of the party and the masses for the realization of tasks are not up to the required level, then the work of the appropriate organisms cannot be said to have been at the level required by the times and the effect of ties with the masses and the grassroots, regardless of their numerical quantity, leaves something to be desired.

For the role which the cadres have in the realization of tasks, their vital ties with the masses make the need imperative for greater assistance to the grassroots in overcoming, as soon as possible, difficulties, shortcomings and weaknesses which manifest themselves. It is espeically necessary that they work more and give greater assistance in combatting manifestations of bureaucracy, officialism and formalism in their work with the masses, because such phenomena appear in the activities of some cadres and communists who often do not listen to the voice and opinion of the masses, who procrastinate and do not resolve their just requests and grievances, and who do not stand at the forefront of tasks. The masses seek and welcome to their bosom those cadres and activists who help them resolve tasks and who clear up their problems and open horizons to them. This also happens with the party organs and organizations, with the mass organizations and those of the press, radio and television, education, etc., which seek and eagerly welcome those cadres who go to them well prepared, open horizons for them and help them resolve their tasks at a higher level. This is by no means fortuitous, but a result of close links which are maintained with scientific level, and of the desire to have in their midst such scientists and specialists as those of the Shkoder Institute of Corn and Rice, the grain sector of the Institute of Agricultural Research in Lushnje and many cadres and specialists in other fields.

Both effectiveness in work and effectiveness of ties with the masses depend on the preparation that is made to face problems in all their aspects on knowledge of the concrete situation and the people we manage, on the manner and language in which we communicate with them, as well as on our example and direct commitment to the realization of tasks. Such preparation to know, face and resolve problems often goes wrong and is not made at the same level by all cadres, neither for the problems they pursue in the office nor when they go to the grassroots. Before we go to a district, Comrade Enver teaches us, we must be well acquainted with its condition and especially with the problem we will pursue, with what we will control, observe and analyze; otherwise, he continues, we fall unwittingly into the position of an observer and a listener and we are not in a state to give our considered opinion.

Ties with the masses and direct relations of communists and cadres with them constitute party work and, as such, cannot be accomplished outside working hours, just as communication with the people cannot be made with official papers and receptions. It requires, therefore, a closer spiritual bond with the masses, which is achieved when you are among them. "We do not have to designate a day for reception of workers in the office," say the management cadres of the "Misto Mame" wood combine in Tirana, when they speak about their experience of ties with the masses, "because we go to the workers every day. We meet and talk with them: they tell us their troubles and their observations about the work, and this practice is accomplished by the director, the party secretary and every brigade leader." They also receive workers in the office, but the data indicate that in this model combine, few workers are directed to the administration office. Comrade Enver taught us that in the sound ties of the party with the masses, officialism dies.

In order to realize such ties with the masses, a thorough comprehension is necessary, to gether with more initiative, more stimulation, organization and control, and a struggle against manifestations of spontaneity. We may say that we are far from what the party has instructed for management cadres: that on a Saturday or Sunday we should arrange a program and to to a village, a mine, a boarding schoool, a military unit, etc., for a leisurely meeting and talk with people, in order to explain and clarify a directive for them or to talk about their situation. This has not become a practice and work is needed to transform it into a good tradition and an organic part of the method of management. "When the leading local party and government administrators go systematically among the masses, when they become acquainted with and take into account their progressive opinions on the problems which concern them," instructs Comrade Ramiz Alia, "they set the whole apparatus into motion, sake them free from office work and bring them close to the workers."

When the cadres go down to the grassroots, espeically the cadres of the ministries and districts, and meet with cadres, specialists, workers and cooperativists, care must be taken so that they do not limit themselves only to the problems of the sector or to the problems which they cover as a sector. We say this because in practice it seldom happens that when they return from the grassroots, they bring back problems concerning other sectors and even in basic organization meetings, few questions are raised about the others. Broad interests is needed in the meetings and other forms of ties with the workers, communists, and districts because account is not taken of the fact that regardless of the sector in which someone works and regardless of the problems covered by the ministry from which he comes, issues are raised for resolution within the jurisdiction that has been given by the party and the state. Having ties with the masses, instructs Comrade Ramiz Alia, constitutes going to the worker and the cooperativist, to the pupil and the soldier, knowing their difficulties and troubles, resolving them on the spot and preventing solutions based on favoritism and interference of involving official documents and bureaucratic orders.

Another important problem is the further extension of radius of the movement at the grassroots. What happens? In some cases, it is limited to a few districts and enterprises, and many other districts and enterprises are left out. This does not mean that there should be a fixed number of times for visits to this or that district or to this or that enterprise, agricultural cooperative, school or military unit, but that there should be the most accurate planning possible and the most complete knowledge possible of the problems that exist. This knowledge is not gained solely by means of written information that is sent or by means of telephone calls, but by means of visits by their managers for reports and consultations. It is seen lately that the "geography" of visits to districts has been widened by many ministries, which have made interesting studies. It is important to bear this well in mind also because of the fact that through a more thorough knowledge of the problems of the districts, enterprises, etc., the cadres will be in a better condition to make suggestions and give more concrete directives for realizing tasks, as well as being more competent in the duties they cover.

Closer ties with the grassroots and the masses and better knowledge of their life and activities must also be reflected in the level of materials which are prepared and the analyses and discussions which are developed, as well as in the quality of problems which are raised and, generally, in a more obvious emancipation of these activities. We say this because there is often a tendency toward observation: few problems are raised and there is a lack of concrete proposals and measures which should be taken to resolve tasks. The education sectors of the party committees of districts, in particular, must make good observations and generalizations of the advanced experience which has been gained in overcoming difficulties and resolving tasks by the organs and organizations of the party and their levers. They must engage in wide propaganda through the press, radio and television, through publications and oral and visual propaganda and through the most effective emulation, so that our means of education and propaganda may assist as much as possible in diffusing more widely the experience and example of innovators in the work of the party and social organizations, as has been done with the experience of party and government organs in the Lushnje District and several other districts.

A very important area of ties between the party and the masses is constituted by the mass organizations. The party has always considered the work with its levers as absolutely necessary in order to realize its goals and program. The greater and more important the tasks which the party accomplishes, the more its concern and work increase with the mass organizations. From this viewpoint, they play a particularly important role in the education and mobilization of workers for the realization of the party's program. Certainly, each of the mass organizations has its own specific work. If must bear this in mind, but the strength of the single front among them, under the leadership of the party, is also needed.

FORMER TURKS ADDRESS PROTEST TO TURKISH PRIME MINISTER

Sofia OTECHESTVEN FRONT in Bulgarian 28 Nov 85 p 3

[Open letter to the Prime Minister of the Republic of Turkey from a group of Bulgarians from the Peoples' Republic of Bulgaria who have reestablished their Bulgarian names, dated 27 Nov 1985. Passages in slantlines rendered in bold face in text.]

[Text] Mr Turgut Yozal, We protest most vigorously against the systemic attempts that you are making in your capacity of prime minister of Turkey to interfere in the internal affairs of our homeland -- the People's Republic of Bulgaria -- and in our actions -- those of Bulgarians who have reestablished their names. As prime minister, you are undeniably right, and we would say morally obliged, to speak about and be concerned for the situation of the citizens of Turkey, but you have no right to speak on our behalf, trying to reduce us to the object of your self-seeking speculations and political games.

By flagrantly making unfounded accusations and warlike threats against the peace-loving Bulgarian people, you allow yourself to violate elementary political ethics.

We are disgusted by your efforts to justify all this before the highly responsible forum of the General Assembly at the UNO, and in other places with non-existant clauses in bilateral and international treaties. You no doubt know that there are no treaties that give you the right to interfere in foreign affairs, nor can there be.

You, Mr Prime Minister, and some of your ministers and officials are also concerning other international forums with questions belong to the exclusive competence of Bulgarian citizens, and then you submit to your own people that your slanders about Bulgaria find international support. But who has upported you in these attempts, and when? Why are you deceiving your own people? Do you think that such lies will pass?

We know the Turkish people very well. For centuries on end we lived side by side. The present-day Turkish people are politically mature. You can mislead them for a while. But then sooner or letter they will hold you responsible.

We are convinced that your actions will remain in the history of the Republic of Turkey as the grossest provocation against the Bulgarian people and against the people of the Republic of Turkey, who have proved that they can live in peace and good neighborliness. These actions, Mr Yozal, are a loud demonstration of imperialist feelings and aspirations. With what right do Turkish officials distribute in Muslim countries a map fabricated in Turkey showing that two-thirds of the terrirory of Bulgaria (including our sacred Batak, Perushtitsa and our ancient capitals of Pliska and Preslav) are lands inhabited by a non-Bulgarian population?! Is that not an expression of your illusory, imperial appetites and intentions toward our homeland? Your behavior recalls the pompous, presumption of an Ottoman vezir, but that is long since history.

You and your followers are attempting to cover up your imperialist pretensions under the veil of concern for the rights of Muslims in Bulgaria. There is no well-intentioned politician in the world who has visited the People's Republic of Bulgaria and not seen with his own eyes and not appreciated the freedom enjoyed by all religions in our country. You know this very well. However, you attempt to suggest other ideas about which we for our part are categorical, and we declare: the fact that some of us confess the Muslim faith is no reason for us to be considered Turks. What right do you have to confuse the religious and national feelings of Bulgarians who confess Islam. Your attempt to strike the attitude of spokesman for the Muslims of Bulgaria, of sole spokesman for the Muslim world, is both strange and disgraceful. Bear in mind that not a single Bulgarian -- neither atheist, nor Christian nor Muslim, has fallen into such a position that he needs your concern and protection.

As a political figure, Mr Yozal, you know very well that such attempts and attitudes are in gross contradiction of the Turkish constitution. On its very first page is written, black on white, that the Turkish citizens exist only in "indissoluble unity with the Turkish state", that no ideas can contradict the principle of laity, which requires "the separation of the affairs of church and state".

We would like to ask you what connection there could be between Muslims, who are Bulgarian citizens, and the Turkish state that you take upon yourself the right to speak on their behalf. As far as we know, you have not been proclaimed a caliph for the Muslims of the world to consider the Muslims in our country as your religious flock on that basis.

Since you like to pose questions to different international forums, would you tell us what has happened to the thousands of Bulgarians who live in Turkey? What is the fate of the Armenians, Greeks, Curds, Arabs, Assyrians and Albanians and others in your country? How is their national survival reconciled with article 66 of the Turkish constitution, according to which every subject of the Republic of Turkey is a Turk, or with the 1934 law of compulsory change of family names which obliges every citizen of Turkey to take for his family an assumed name, irrespective of his nationality?

Why, Mr Prime Minister of the Republic of Turkey, do you in your statements stubbornly avoid speaking about the condition of human rights and nationalities in your country? You remain silent about the 5 million unemployed, about the millions of Turkish citizens who are exiled from their own hearths and condemned with their families to seek subsistence in foreign countries! You mention nothing of the millions of Turkish young men and women, deprived of the right and the opportunity to receive an education and find their place in life! And what about the Kurdish children, condemned to illiteracy and misery?! Maybe it is precisely with respect to the Turkish citizens that you should be disturbed and show your concern for human rights! Admit that it was awkward for you and the rulers of the Turkish people the day you dared to slander our country and its citizens, on the very day that the European Parliament once more condemned Turkey for the lack of the most elementary democracy and for violating basic human rights.

People who live in glass houses shouldn't throw stones.

We Bulgarians who have reestablished our Bulgarian names don't expect answers to questions that are ours alone. They are clear to us and categorically resolved by us.

We hope, Mr Yozal, that you are still able, in your capacity of Prime Minister, to make a sober assessment of your actions up to now, draw the necessary conclusions and take the necessary steps in the name of neighborly relations and cooperation between our countries and peoples.

/Kamen Kalinov/, Member of the Central Committee of the Bulgarian Communist Party, Deputy to the National Assembly, chief editor of NOVA SVETLINA, honored cultural worker, Master of Arts (History).

/Nadya Asparukhova/, Candidate Member of the Central Committee of the Bulgarian Communist Party, Member of the State Council of the People's Republic of Bulgaria, secretary of the okrug committee of the BCP, Kurdzhali.

/Aleksandur Kolev/, Candidate Member of the CC of the BCP, public worker, Master of Arts (Philosophy).

/Blaga Tatarova/, Candidate Member of the CC of the BCP, member of the Bureau of the National Committee for the Defence of Peace, member of the Committee of the Bulgarian Women's Movement, Master of Arts (History), active fighter against fascism and capitalism.

/Orlin Zagorov/, Deputy President of the Council for the Development of Spiritual Values of the PRB, member of the Committee for Culture, PhD (Philosophy).

/Radi Semov/, Member of the Central Control and Revisory Commission of the BCP, Secretary of the okrug committee of the BCP, Kurdzhali, Master of Arts (Philosophy).

/Khristo Marinov/, Deputy to the National Assembly, Secretary of the National Council of the Fatherland Front.

/Nikolay Antonov/, Secretary of the okrug committee of the BCP, Shumen.

/Radul Chavdarov/, Secretary of the Central Committee of the Dimitrov Communist Youth Union.

/Asen Sevarski/, Member of the Union of Bulgarian Writers, poet, Deputy Chief Editor of NOV ZHIVOT, honored cultural worker.

/Zarko Khranov/, Member of the National Council and Ppesident of the okrug committee of the Fatherland Front, Kurdzhali.

/Svetlana Dilova/, Candidate Member of the CC of the BCP, member of the bureau of the okrug committee of the Bulgarian Women's Movement, public worker, Shumen.

/Yulia Pirinska/, Member of the Central Committee of the Bulgarian Professional Unions, President of the okrug committee of the Bulgarian Professional Unions, Razgrad.

/Alen Arnaudov/, public worker, deputy chief of department in the National Council of the Fatherland Front.

/Aldemir Siderov/, Assistant Professor at the Sofia University "Kliment Okhridski, PhD (History).

/Naum Shalamanov/, twice world champion weightlifter, honored master of sports.

/Mikhail Yanchev/, Member of the Union of Translators in Bulgaria, journalist, teacher at the Sofia University "Kliment Okhridski".

/Miryan Topchiev/, Chief Mufti.

/Andrey Andreev/, Journalist, member of the editorial board and chief of department at NOVA SVETLINA, Master of Arts (History).

/Marin Kolarov/, Secretary of the okrug committee of the BCP, Turgovishte.

/Yuliana Khristova/, Deputy to the National Assembly, public worker, student at the Sofia University "Kliment Okhridski".

/Sabotin Tasev/, Editor-in-chief at Bulgarian television.

/Vladimir Feradov/, long-serving public worker in Sofia, active fighter against fascism and capitalism.

/Delyan Tetev/, Member of the National Committee of the Fatherland Front, Sofia.

/Anton Iliyanov/, Member of the editorial board and chief of department at NOVA SVETLINA.

/Apostol Orlinov/, Secretary of the okrug committee of the Fatherland Front, Turgovishte.

/Subin Shterev/, honored master of sports, chief wrestling coach in the okrug committee of the Bulgarian Union of Physical Education and Sport, Turgovishte.

/Svetlana Yosifova/, public worker, Popovo.

/Boril Kosev/, hero of socialist labor, president of the agroindustrial complex in the village of Venets, Shumen okrug.

/Boryana Rafaylova/, okrug advisor, worker and tutor at the Partizanka tobacco combine, Shumen, awarded the gold medal of labor.

/Emil Demirev/, rayon mufti in Shumen.

/Engineer Deyan Chaushev/, Secretary of the okrug committee of the BCP, Silistra, okrug advisor.

/Subina Marinova/, hero of socialist labor, weaver in the Dobrudzha factory, Silistra, member of the okoliya industrial combine, Silistra.

/Radi Deyanov/ Deputy president of the municipal council of culture in the town of Glavinitsa.

/Aneta Asenova/, Member of the National Council of the Fatherland Front, secretary of the municipal committee of the Fatherland Front, Ruen.

/Sider Khadzhiev/, rayon mufti in Aytos, Burgas okrug.

/Ulyana Kirova/, Member of the okrug committee of the BCP, secretary of the party committee at the grain fodder combine in the town of Tolbukhin, okrug advisor, awarded the Order of the People's Republic of Bulgaria, third degree.

/Sergey Radomirov/, Head physician at the rayon hospital in Tervel, Tolbukhin okrug, honored physician.

/Khuben Khubenov/, rayon mufti in the town of Tolbukhin.

/Subi Khadzhiev/, active fighter against fascism and capitalism, public worker from Haskovo.

/Khristo Nikov/, Member of the bureau of the municipal committee of the BCP, president of the municipal committee of the Fatherland Front, town of Kotel, Sliven okrug.

/Lyubomir Aleksiev, Deputy to the National Assembly, leader of the vintner's brigade in the village of Medovets, Varna okrug.

/Sokol Khubenov/, worker in the technical control section in the instruments and non-standard equipment plant at the Record combine, Plovdiv.

/Chavdar Kurdov/, rayon mufti in Plovdiv and temporarily managing the office of mufti in Kurdzhali.

/Anatoli Rafaelov/, Chief Director of LVK [not further identified] Sukhindol, Veliko Turnovo okrug, municipal adviser, member of the municipal committee of the Fatherland Front, president of the Lozen physical education association.

/Khristomir Mikhaylov/, ballet master at the Rusen People's Opera.

/Emiliya Kovacheva/, hero of socialist labor, Dimitrov Prize laureate, former worker in the Dunavska Koprina combine, Ruse.

/Lyudmil Anastasov/, hero of socialist labor, honored master of sports, world wrestling champion.

/Andrey Radoslavov/, hero of socialist labor, leader of the complex brigade in the village of Trapishte, Razgrad okrug.

/Iliya Georgiev/, rayon mufti, Razgrad.

/Zina Tikhanova/, honored teacher, teacher at the V. Kolarov ESPU [not further identified], Razgrad, public worker.

/Sanya Dervisheva/, active fighter against fascism and capitalism, Pleven, spouse of an active member of the BCP who perished in the fight against fascism.

/Marina Zarkova/, public worker, chief of department at NOVA SVETLINA.

/Emiliya Gavazova/, member of the Central Committee of the Union of Bulgarian Teachers, deputy director of the elementary school in the village of Mlechino, Kurdzhali okrug.

/Martin Kamenov/, hero of socialist labor, leader of the Georgi Ivanov construction brigade at the construction and installation combine, Kurdhzali.

/Andrey Videnov/, brigade leader in the tobacco producing brigade in the village of Boyno, Kurdzhali okrug.

/Marin Raychev/, brigade leader in the exploitation brigade in the Zvezdel mine, Kurdzhali okrug, awarded the Georgi Dimitrov medal.

/Subi Shterev/, Town hall secretary and secretary of the primary party organization in the village of Turnovtsa, Turgovishte okrug.

/Felina Arsova/, Mayor of the village of Kus, Shumenski okrug.

/Ana Marinova/, Gymnastics coach, DFS [not further identified], Gabrovo.

/Neli Dervisheva/, teacher at the P. Yavorov ESPU, Pleven, daughter of an active member of the BCP who perished in the fight against fascism.

INTERVIEWED WORKERS COMPLAIN AGAINST CORRUPTION

Sofia OTECHESTVO in Bulgarian No 22, 26 Nov 85 pp 18-20

[Interviews conducted by Milena Angelova and Khristo Peev]

[Text] Managers -- young people from the Liliya Karastoyanova youth labor collective in the watch resonator workshop in the factory for electronic transformer elements in Sofia. The collective had already fulfilled its 5-year plan as early as the middle of July this year, and in honor of the forthcoming party congress it will deliver about two and a half million leva over plan. For two years in a row it has been the capital's leader. Almost all the products manufactured here are intended for the USSR, and, as far as quality is concerned, there's a comsomol guarantee: for a whole 10-year period there has not been a single claim! And for this the young people have been awarded a diploma by the Consulate of the USSR in Sofia. They work under the motto of "the hero is always on duty", and every day the young people fulfil a norm on behalf of their boss. There's no confusing words and deeds. The great truth of our life is created. All the more concern, therefore for the resilience that the other "small truth" is showing.

This conversation is a sequel. A sequel of a similar discussion from six years ago, in which we posed questions in the pages of OTECHESTVO concerning all those phenomena that poison the climate of our relations. We spoke about the so called "connections" and the all-powerful intercessors who change the fate of lives with a single telephone call, and the effect of the motto "there's a different set of rules for my man". The replies of over 70 young workers and employees did not reassure us: 90 percent stated that they did not believe that we could overcome all this. In some of them, a formed inner understanding unambiguously echoed that the existence of such a "second network" was almost a natural phenomenon of social life. In other words, these people had built up in their consciousness the corresponding reflection -- a "second network" of "principles" and "values" which protect the conscience from moral conflicts. But does it protect them from moral damage? We searched for a reply to this question with our new interviewees.

/OTECHESTVO:/ You are all young people. To take your place in your profession, and in life, you have to compete with your peers. Do you have the foregone conviction that sometimes candidates are not on an equal footing?

/Savina Nikolova, 21 years old, production controller, married:/ Today, if you are a realist, you should not forget that there are people with connections everywhere. Against them, you set knowledge, skill, the will to establish yourself, all things which, they have taught you, will guarantee success in life. But in competing against the fellow with connections, these things turn out to be insufficient to bring you success.

/OTECHESTVO:/ Are you saying this based on your own experience, or simply because a lot of people think that way?

/Veselina Mileva, 22 years old, assembler of quartz elements, single:/ Unfortunately, I can confirm that entirely on the basis of personal experience. My first contact with connections came quite early. After seventh grade I applied for the high school of art. I drew well and had taken special preparation. I passed the examinations, but my grades were not enough. I thought that there were better and more talented people then me. I was ready to revise my opinion, and that of those around me, about my capabilities, when it turned out that among those who registered there were applicants with lower grades than mine, and even some who had not taken the examination. That was my first such disappointment, and I took it badly.

/Radoslav Makedonski, 20 years old, assembler of quartz elements, single:/ The second time it's easier, and after the third time you accept that there's no other way.

/V. Mileva:/ Really, I took the second disappointment more easily.

/OTECHESTVO:/ But what happened with the drawing? Your present profession has nothing in common with it?

/V. Mileva:/ I mastered the manipulations fast and now I work well. At least the others say that I am one of the best. But I must confess that I don't hold out any prospects in connection with this profession. It wears you out fast -- the norm, the constant stress, the shifts. Colleagues who have been here for seven or eight years are having difficulty holding out. I shall look for something more suitable, although at the moment I have no idea what that will be.

/OTECHESTVO:/ Well then, is it possible to live in today's world without connections?

/Elka Popova, 27 years old, assembler of quartz elements, single:/ It's possible, that the way they teach us. A young person steps out into the world in the knowledge that work and qualities determine a person's place. But you set out on your own journey and you see that it is not always like that. Connections, intercessions, fawning... as if at every step. And you have to be very strong and firm to stay true to the honest principles that you were brought up with.

/OTECHESTVO:/ At every step -- isn't that an exaggeration?

/E. Popova:/ This is what happened to me in just one day. I went to buy bread. For the saleswoman's friends there was warm bread, for me only cold bread. I went to the greengrocers -- from the backdoor they were handing out bananas, for me there were none. I went to the shoestore -- the style I liked was sold out, but some clients were quietly taking those very boots from closed boxes. And so it goes on, every day, for years on end. So now people begin to see intercessions and connections even when they aren't there. If some young person is suddenly promoted at work, if he wins an important competition, or has a big success, invariably the lie goes out that someone is behind him. Maybe not, but those around can't see it.

/OTECHESTVO:/ And that's one of the ways in which negative phenomena damage the consciousness.

/E.Popova:/ It's not the only one. The shadow of doubt falls not only on the person in question who, with all his ability, feels guilty because he is not in a position to prove to everyone that his success is honest. We lose faith in the conformity between words and deeds. It has reached the point where a fellow hates his dreams because they make him miserable and an incorrigible idealist ahead of time.

/OTECHESTVO:/ Let us ask again. Are you saying this on principle or do you have a concrete example in mind?

/E. Popova:/ On principle but I have an example. A close friend of mine applied for university together with a fellow student. My friend got a "4" on the examination, his friend got a poorer grade. Their diplomas are identical. But they accepted the second fellow because his father is a "big gun".

/OTECHESTVO:/ Strange.

/V. Mileva:/ Not to take you with a "4" on the examination is simply incredible.

/E. Popova:/ There's something else incredible too. That the boy didn't make any effort to find out why that happened, to defend his rights. He kept saying that there was no sense, that they wouldn't tell him the truth anyway.

/Aneliya Stoyanova, 25 years old, assembler of quartz elements, married:/ Of course they won't tell him the truth. These things are always done on the quiet, as if no-one knows the truth. I know, because something like that has just happened to me. For several years my family has been listed as a priority as being in severe need of a place to live. At about the same time the neighbors were listed too; they were also living in an unsanitary, small apartment like ours. However, when homes were assigned, the neighbors received an apartment and we got a polite refusal and a request to be patient until next year. We went to the council, asked on what grounds the decision was taken, but everyone shrugged their shoulders and confirmed that that was the way the commission decided. The neighbor was more honest and confessed that if we didn't find our own man we would be waiting a long time. And she was right. At the next assignment, again there were other people who turned out to be more needy, and again they asked us to be patient.

/OTECHESTVO:/ You're officially listed as very needy?

/A. Stoyanova:/ Yes. We have children and comply with all the conditions.

/OTECHESTVO:/ How many years have you been waiting for somewhere to live?

/A. Stoyanobs:/ Since 1980, 5 years already.

/OTECHESTVO:/ Don't take this as a provocation, but do you think that you can live without connections?

/A. Stoyanova:/ You can, but badly ... (laughter).

/Maria Ignatova, 23 years old, assembler, married:/ Personally, I have difficulty imagining such a beautiful picture of life in which noone uses connections for anything.

/OTECHESTVO:/ You speak as if you have never run for help to "your man".

/M. Ignatova:/ Why strain my conscience? Of course I have. Life is such that if you want to start work, then someone has to say a couple of good words for you.

/Retort:/ What work? As a bartender? (Laughter)

/M. Ignatova:/ Sometimes. The most ordinary work. Factory work. Take me, for example. When I came to work at the factory I was pregnant. And don't you know that noone cares to see such applicants anywhere. So my mother-in-law, who has been working here for years, had to help.

/OTECHESTVO:/ Do you discuss these things with your acquaintances and peers?

/M. Ignatova:/ We discuss them, and we've decided that, rather than disappearing, connections are expanding more and more. In spite of the fact that we are all supposedly struggling against them.

/OTECHESTVO:/ Are you sure about that "more and more"?

/M. Ignatova:/ I'm sure.

/OTECHESTVO:/ And are you sure that you're struggling?

/M. Ignatova:/ I'm trying. Even though I hardly use them myself. You'll tell me that I'm contradicting myself; didn't I just say that I started work thanks to an intercession. But I was entitled to get this job. They give priority to pregnant women and mothers of small children, don't they?

/OTECHESTVO:/ Yes, that's really interesting. Generally, it's considered that a person uses connections to work his way toward something to which he is not entitled. Yet in your case it turns out that sometimes you need connections to get something that would be yours anyway.

/P. Makedonski:/ That's what's so good about connections. They work for all kinds of situations. It's a sure thing! (Laughter)

/Ruska Cholakova, 27 years old, assembler, single:/ Your question is very basic. And quite serious. It happens sometimes that without connections and intercessions you are unable to take a place which is rightfully yours according to all the rules. For example, I graduated from the technical school for electronics. I'm a qualified weak-current technician and was assigned to this factory. It would have been logical and correct for me to get a job in my speciality, in maintenance. All of us who were assigned thought so, but then it was clear that some kind of discrimination against skirts was in operation, and they didn't want women in maintenance. If I had been able to unearth some kind of connection, may be they would have made an "exception" and I would have performed at the factory the kind of work for which the state has paid to educate me for years on end. But I don't have connections and now I'm an ordinary worker.

/OTECHESTVO:/ And your unused knowledge from technical school is becoming obsolete.

/R. Cholakova:/ Not only mine. All the girls who were assigned here after technical school.

/OTECHESTVO:/ And you feel helpless to change things?

/R. Cholakova:/ Absolutely. On the whole, in answer to your question as to how we can struggle against connections, intercessions and such improper things, I want to say that the struggle is difficult because you feel alone. Injustice is done to many people but everyone bears the consequences alone, and even those closest to you shrug their shoulders: "We sympathize, but we can't help you".

/V. Mileva:/ And that's the hardest discrepancy between words and deeds. Apparently, we're all denoucing these undesirable things -- you are writing against them in the newspapers, we repudiate them at meetings and in private conversations, but in practice nothing changes.

/OTECHESTVO:/ You said "discrepancy"; is there something like that here?

/P. Cholakova:/ Of course. For years on end we have been asking about some day rooms that we need in the workshop. We don't have a room where we can sit to eat our snacks.

/E. Popova:/ And then we're mostly women. We need to take a break, to fix ourselves up.

/R. Cholakova:/ The very first time we made our requests the factory managment promised us that they would meet our requests. And for years we've had promises.

/R. Makedonski:/ A promise is the most polite form of refusal. (Laughter)

/OTECHESTVO:/ It's strange that you should say that, when you have made a comsomol promise of production without rejects and when for 10 years now you haven't had a single claim.

/R. Makedonski:/ It seems that the comsomols can keep their promises.

/Zhasmina Todorova, 28 years old, statistical controller, single:/ In my opinion, the majority of young people leave school with a well-built value system. And in this system, consistency in fulfilling a positive act takes chief place. The fewer blows below the belt to the value system, the greater are the guarantees that the person stays true to it. Because what are connections, confusing words and deeds and groundless promises, if you haven't been hit below the belt?

/Nikolay Boev, 27 years old, organizing secretary of the factory committee of the DCYU (Dimitrov Communist Youth Union):/ All this is true and I confirm it. I shall just clarify how things stand with the question of this day room. Because it looks as if the workers keep their promises and the bosses don't. The thing is that a basic expansion has been included in the next 5-year plan for our factory. It is economically unsound to make temporary expansions before then. We simply have to wait a little longer.

/E. Popova:/ I am sure that something could be done even now. There are rooms in the factory that are used only a few times a year. At the same time, 100 women have to wait for years to get at least one day room. Our good work is constantly stressed. Do we really not deserve this small convenience.

/OTECHESTVO:/ It goes without saying that you deserve it, and we are sure that you will get it. But what you say leads us to think that the cause for the negative phenomena is due to the fact that not everyone has an exact criterion of what is their due, what they can demand of their surroundings and of society. What, in your opinion, builds this criterion; who helps the young person to form it himself?

/R. Makedonski:/ First of all, experience. It's like with children. As they reach out for something that isn't for them, they get their fingers slapped. If they're slapped twice, they don't reach out a third time.

/Z. Todorova:/ Yes, but with adults, some get slapped on the fingers and others are helped to grab the wealth that isn't theirs.

/E. Popova:/ The most amazing thing is that such injustice sometimes shows up with regard to children. At first I told you that I was single, actually I'm divorced with children. My son is only six but he has already noticed that some of his little friends in kindergarten are privileged. Identical offences do not receive identical punishment. Identical efforts are not met with identical praises. In the courses they take, it's always one and the same children who recite poetry and one and the same who form the background. After a series of recitations, my son asked: "Mommy, isn't it my turn now?" How can I tell him that his turn won't be coming soon.

/OTECHESTVO:/ What is the principle of selection in your opinion?

/E. Popova:/ The professions of the mother and father and how they might be of use to the teacher.

/OTECHESTVO:/ Why don't you look for some type of connection with the teacher. After all, we're talking about helping your own child?

/E. Popova:/ I wouldn't do it. If he learned to expect my help, then later he wouldn't find the incentive within himself to reach his goals alone. And that's a type of moral disability.

/Z. Todorova:/ Maybe that is the surest way to struggle against connections and intercessions. Simply to exclude them as a possibility from the consciousness of our children.

/M. Ignatova:/ Or else to create some sort of collective way of struggling against them.

/N. Boev:/ There is such a way -- the comsomol and party organizations, the strong relationships inside the collectives. For example, I am sure that if a protected person, without the necessary qualities, appeared in your collective he would very soon feel that his place was not there.

/Z. Todorova:/ Yes, a natural selection operates in production. Only those who can remain, those who can't resign. But I'm not sure that it works like that in the non-productive sphere.

N. Boev:/ There's something else too. For example, I haven't heard of anyone being punished for using connections.

/OTECHESTVO:/ How could they punish him if he had connections! (Laughter)

/N. Boev:/ But in order to act successfully against these phenomena, people must be punished not just morally, but by the state, by the law.

/OTECHESTVO:/ Now we come to the question of whether you, sitting in this room, have found this conversation useful, and what conclusions have you reached for yourselves?

/S. Nikolova:/ Of course, it has been useful. Because a person has to begin to think so as to understand that the apparently innocent "small truth" destroys large and valuable things, that its small offensives may discourage even the most adamant person, drive him to feel deceived and robbed of his most beautiful aspirations.

/V. Mileva:/ I must confess that the discussion has been useful in as much as I really began to think about these things. That hadn't happened until now. And the conclusion is that we have to fight against them. And although I still don't know how, I shall still try to find my way in this battle.

/E. Popova:/ This isn't the first time I'have had a discussion like this. And it surely won't be the last. My sincere wish, however, is to live to see the day when such deliberations are superfluous.

/R. Makedonski:/ For me the conclusion is that young people are in a position to influence a successful resolution of the problem. I'm only afraid that this will take time.

/R. Cholakova:/ For myself, I drew the conclusion a long time ago: I don't use connections. I see that that is not enough and the phrase "Well, whatdoes that have to do with me" is actually the first step toward legitimizing the negative in life.

/A. Stoyanova:/ There are those among my colleagues who think that I got my place in the factory with connections. That makes me bitter and I try to refute it with my work.

/M. Ignatova:/ Let's hope we don't remain with discussions. Let's hope we find the strength to act as well as we talk.

/Z. Todorova:/ In this discussion, we established that you don't need connections to become a worker. (Laughter) I believe that the young people must be the most irreconcilable toward negative phenomena. Until they safeguard their ideals and dreams, until they clearly differentiate good and beautiful from evil and ugly. Until they are not resigned to become "like the others".

/N. Boev:/ I don't know why during this entire discussion I was thinking of those young people who, let's say, in 1942 went to face the bullets and the gallows in order to defend their ideals. As I listen now to talk of connections, intercessions and intrigues that take the place of principles and even ideals, I'm revolted. That's why I think that discussions such as these must be held everywhere. And, more important, with our actions we should say "enough" to all moral deformations.

SUEDOSTEUROPA STUDY OF 1985 PARLIAMENTARY ELECTIONS

Munich SUEDOSTEUROPA in German No 10, 1985 pp 536-560

[Article by Goetz Mavius, PhD, a scientific collaborator at the Historical Institute of Hamburg University: "The 1985 Parliamentary Elections in Hungary"]

[Text] On 8 June 1985 the tenth parliamentary elections since 1947 took place in Hungary.[1] Since these were the first elections according to the new election LawIII/1983,[2] which entailed some vital changes, they attracted considerable attention, especially in the Western press.[3] The election attracted attention among observers of many years, especially on account of its possible importance in connection with the economic reforms. In Hungary the connection between the economic reforms and the reform of the "work of the people's representations"[4] was not only seen but expressly emphasized.

The Legal Basis

Therefore the 1985 parliamentary elections should not be viewed in isolation. Without going here in detail into the norms and principles laid down in the constitution (Law XX/1949 in the new version by Law I/1972 with the changes by Laws I/1975 and II/1983), it can be said about the election practices: Law III/1983 forms a further step on the road of an electoral law reform, which was initiated with Law III/1966.[5] At that time election districts were formed with one direct seat each in the parliament, which was obtained by the candidate with the absolute majority. The law specifically initiated the possibility of several candidates in one election district. This possibility was made use of in 9 election districts in the subsequent 1967 parliamentary elections. When with Law III/1970[6] the nominating monopoly of the Patriotic People's Front, (Hazafias Nepfront, HNF), an umbrella organization of various associations, social organizations and of the MSZMP, was broken and the nomination of candidates was entrusted to voter meetings, the number of districts with more than one candidate rose to 49 in the following parliamentary elections in 1971, among them one district with three candidates. Thereafter the number of districts with two candidates declined from 34 (1975) to 15 (1980).

Instead of reacting negatively with haste to the apparently clear disinterest of the people in voluntary multiple candidacies and abolishing this possibility directly or indirectly, the progressive forces in the state and party leadership

Cartoon by Andras Meszaros

recognized that this reaction of the voters had its origin in the fear of too much involvement, in intimidations or obstacles by conservative elements of the state and party hierarchy and many others, which also had a lasting effect in the case of the 1985 election. The step taken with the 1983 election law eliminated some of these causes. Two candidates became obligatory in all election districts, who were proposed by the HNF at voter meetings but did not have to be accepted and could be replaced or supplemented by new candidates--if they received at least one third of the votes in two meetings.

For the "election campaign" two weeks more than in the past were available. That in the time from 15 April to 8 June much more than in the past an election campaign--i.e. a competition in the representation of assumed or actual voter or local interests--was involved is proved by various statements in the press, but especially impressively by an Andras Meszaros cartoon.[7] Under the heading, "The Opposition Candidate," it is shown how someone erects the facade of an opera house in a village with paint and papier-mache, accompanied by the applause of the public. The emptiness of this sham structure is clearly discernible. The comment on the event is: "He tries everything to overtake me." Laszlo Rozsa reports on actual cases in which violations of the democratic rules occurred during the election campaign because of unsureness in dealing with the new legal opportunities:

> It also happened that the heads of the election meetings showed unsureness if an official candidate was not chosen, a strongly deviating opinion was advocated or the local leadership criticized. Cases are known where attempts were made to induce spontaneous candidates to quietly withdraw. Now and then in small places an action was started by families or friends to get their own candidate accepted.[8]

However, the end result was a success and vindicated the legislators: in 58 of a total of 352 election districts more than the two obligatory candidates were nominated, including twice as many in four election districts. Thus a greater success was immediately achieved with the first election following the new law than in the second election following Law III/1966, in 1971, in which a measure of familiarization must be taken into consideration. The trend that will be shown by the coming elections will depend very greatly on the work of the new parliament up to 1990. The intra-Hungarian discussion on a reform of the work of the parliament in direction of its expansion and upgrading cannot be discussed here. An interview with the president of the parliament, Sarlos,[9] one month prior to the election, however, does not lead to the expectation of far-reaching fundamental changes.

The Election Procedure

Since the 1975 election, the country has been divided into 352 electoral districts. Since 15 April 1985 nominating and election meetings have taken place in each of the districts. Altogether[10] 702 meetings with 1.5 million participants were counted, i.e. roughly 20 percent of the qualified voters actively participated in the election campaign. But the actual share is likely to have been somewhat lower than that officially announced, arithmetically correct figure, since the unknown number of participants in several meetings must be deducted. To nominate a candidate, it was necessary for the candidate to receive at least one third of the votes at two separate meetings. In this process, the two figures of votes and participants were added together for the evaluation. In most cases the procedure was raising of hands and counting from the rostrum; thus courage for the vote was necessary.

In the 352 districts, 867 persons competed for a candidacy, of which 715 were proposed by the HNF and 152 by the meetings. At the meetings 97 percent of all HNF proposals were confirmed and only 50 percent of the voter proposals, for which reason the 766 candidates consisted to 90 percent of HNF candidates (696) and only 10 percent of voter candidates (70). According to statements by Istvan Horvath, secretary of the MSZMP Central Committee, of 26 June 1975, 78 of the 766 candidates were proposed by the voter meetings.[11] Accordingly, only 688 candidates were HNF proposals and 27 HNF proposals were rejected. Assuming that all third and fourth candidacies were based on voter proposals, an HNF candidate competed with a voter candidate in 16 districts and maximally in 278 districts (78.9 percent) the choice would have been between HNF candidates exclusively.

The numerically small rejection of 19 or 27 HNF proposals (only 2.7 or 3.8 percent) nevertheless appears to have met with criticism within the HNF. "A functionary of the Patriotic People's Front felt that in future public opinion must be sounded out more carefully to limit even more the circle of the official candidates that are not accepted by the election meeting." However, the NEPSZABADSAG commentator regarded this "as natural, as healthy, as an essential expression of the democratic voter wish."[12] This report reveals three things: firstly, there are circles to whom this form of democracy goes too far; secondly, HNF candidates are called "official candidates," which labels the voter proposals as "inofficial," as almost against the rules; and thirdly, there are party circles whose understanding of democracy is more liberal and goes beyond the forms practiced until now. The above quoted commentator even asks the question "whether...or not the practice of the one-man candidacy--with all its consequences--has not lasted too long."

For all that, the ideological-political leeway for the candidates is narrowly limited; although they need not be party members or to accept the party program, they must identify themselves with the HNF program (closely associated with the MSZMP). A position against socialism was completely out of the question.

After the nomination of the candidates at the meetings, they were checked by the National Election Presidium, which was largely identical in terms of personnel with the HNF, which, however, led to rejection and new nomination in only one case. In addition to the candidates for the direct seats, the National Election Presidium for the first time drew up a national list which comprised 35 persons. Thus parliament becomes bigger than in the last three legislative periods by the size of this group and numbers 387 persons.

On election day, voting was done by national list and direct seat on separate ballots and with separate procedures. One ballot contained the 35 names of the national list. From it one, several or (by a diagonal line) all names could be crossed out. All the remaining names were valid. The second ballot contained the candidates for the direct seat. Here all but one name had to be crossed out,

who was then regarded as having received an affirmative vote. If the voter's choice was not clearly recognizable, the ballot was considered as void. Only if all names were individually crossed out was the vote regarded as a vote against.

Beyond that, the two procedures were handled in different ways: for the national list, voting could be done any place (thus also at a vacation spot) against production of the required papers; for the direct candidates the vote could be cast in the electoral district only. This explains the differences in election participation of roughly 160,000 votes. Since the voting system in the case of the direct candidates was rather complicated, there were relatively many void ballots. Moreover, participation in the election was lower than in all preceding elections since 1949 (94.66 percent). Steven Koppany's speculation[13] that the appeal of the Hungarian dissidents for the boycott of the election had such a broad effect appears to overestimate the degree of intra-Hungarian awareness of the appeal and is not quite plausible.

The explanation by HNF General Secretary Imre Pozsgay[14] to start with does not look very valid, namely that the weekend vacationers who had left early had abstained since in 1980 the voting was done on exactly the same day (8 June), which then was a Sunday. If the disinterest additionally cited by Pozsgay is specified and the election system is taken into consideration, then the picture emerges: in 1985 more vacationers did not vote at the vacation localities because they could not participate in the more interesting part of the election, the direct seat. Aside from that, there remains a hard-to-explain "grey zone" of abstentions which in this election undoubtedly was bigger than in 1980. Excessive apprehensiveness over the new, this system-inherent aversion to taking risks that is known from the history of the economic reform, may have played a special role here.

The fact that the election system was regarded as complicated was reflected in the detailed descriptions and explanations in public. A pocket book on this topic was published in the Kossuth publishing house in the series "What Do We Have to Know?"[15] And in NEPSZABADSAG[16] alone four explanations (in part with pictures) on the system were reprinted, including a cartoon with the characteristic title "We are just learning it!" Palliative was the assessment of the chairman of the national elections executive, Lajos Papp, who, in view of the complexity, stressed: "It is therefore noteworthy that the number of spoilt votes was relatively low."[17] Obviously the national election executive had expected a larger percentage.

Of the valid votes cast, a candidate had to collect half of those cast in the first ballot on 8 June. Thus the results as in the case of the previous eight elections with figures between 97.07 and 99.7 percent could not be expected from the outset.

If no candidate received the absolute majority in a district, there had to be a runoff election on 22 June. For this purpose, the entire nominating process had to be repeated in an abbreviated form. As a result, there were changes in the lists of candidates between main election and runoff election. The duty to nominate two candidates continued, so that in electoral district 5 of Zala County no runoff election could take place because shortly before the election

two of the candidates withdrew. In the runoff election, the simple majority sufficed, which in only 14 cases remained below the absolute majority and which in two cases was expressed only in the second decimal place.[18] If a candidate failed to receive the seat but had more than 25 percent of the votes, he thus automatically becomes the deputy's potential replacement and moves up (in case the deputy leaves).

The Results

After conclusion of the nominating procedure it was established that in 58 of 352 electoral districts more than two candidates had been nominated. Far above the national average were the counties of Borsod, Gyor-Sopron and Zala, in which three and four candidates had been nominated in more than a quarter of the districts. Only the voters of Heves County completely failed to do so.

In 42 electoral districts none of the candidates achieved the absolute majority. Herein were included two-thirds of the three-candidate districts and all four-candidate districts, but also 7 districts with two candidates. While in 1985 no runoff elections had to be held only in two counties (Heves and Somogy), in 1980 runoff elections had taken place in only two electoral districts: in one electoral district with two candidates and in another in which the sole candidate had died shortly before the election. At that time, the election committee had arranged the by-election on its own. Following Law III/1983, the procedure of the runoff election was newly regulated by legislative action.[19] The measure shows that such an increase in the share of runoff elections had been assumed.

For the runoff election of 22 June 1985, there were 105 candidates instead of the former 123 candidates with 24 having two candidates; 15, three candidates; and 3, four candidates. Twenty-nine candidates withdrew between the ballots, 14 new candidates were nominated of which 7 attained a seat.

The Deputies

A broad spread depending on the personality of the candidates characterizes the total picture of the election results. The extremes are, on the one side, the

12 deputies who during the main election on 8 June (all against one competitor only) barely won with percentages between 50.1 and 50.5 and on the other side the 6 candidates who received more than 80 percent of the votes.[20] What is remarkable in these results is the fact that among the 12 very narrow victors, there are 5 reelected deputies and 3 additional deputies of 1980 correspondingly were barely disqualified, while among the 15 most clearly outstanding victors with a share of 75 percent of the votes or higher, there were only 3 deputies elected in 1980, but in 2 districts former deputies were very clearly defeated.

At the head of this popularity scale there are some nationally known personalities such as Deputy Prime Minister Marothy (87.7 percent = first place), Central Committee Secretary Szuros (85.7 percent = second place), Central Committee Secretary Berecz (75.5 percent = 13th place), above all, however, locally known personalities such as school directors, agricultural producer cooperative chairmen, factory directors or physicians and only to a slight extent, state and party functionaries. Remarkable is the victory of the first vice-president of the Hungarian National Bank, Janos Fekete (Bekes 11), who was nominated at a nominating meeting and received 76 percent (11th place) of the votes against two candidates.

The National List

In contrast to the widely diverse election behavior in the case of the direct seats, the results of the national list offer a uniform picture to which we are accustomed for elections in socialist countries. Of the 35 candidates, 12 received 99.1 percent and 22 obtained 99.2 percent of the votes. The result of 98.8 percent, which the president of the National Council of the Labor Unions (SZOT), Sandor Gaspar, achieved does not fit into this very narrow framework. Since 1965 top labor unionist, he was clearly part of Hungary's top leadership as Politburo member and deputy chairman of the Presidential Council on the one hand, as president of the WFTU on the other hand. Especially in view of the uniform result of the national list, the slight downward deviation of 0.4 percent acts like a clear rejection.

The composition of the personnel of the national list moreover shows the effort to represent all interest groups of the population. Only 24 of the list candidates had been nominated for election by the people in 1980; HNF general Secretary Imre Pozsgay had moved up later on. The other 10 members are newcomers in the parliament. Thirteen representatives of the national list do not belong to the MSZMP. Istvan Sarlos, the top representative of the legislature and old as well as new president of the parliament is entitled to be named as first candidate of the national list, which otherwise is strictly alphabetically arranged. The government is represented in the national list by Prime Minister Lazar. From the Presidential Council, there are here its chairman, Pal Losonczi, his two deputies, Sandor Gaspar and Rezso Trautmann, as well as the secretary Imre Katona, in addition to 7 old and 3 new members elected on 28 June of the total of 17 members, who, however, in addition hold other substantial positions. The 5 leading full-time members of the party organization look rather modest next to the other groups even though the first secretary of the party youth organization (KISZ), Csaba Hamori, and two representatives of the HNF (Gy. Kallai and Pozsgay) are included. In addition to General Secretary Kadar and his deputy Nemeth, 8 of the 13 Politburo members, but only 2 of the 6 Central Committee secretaries and 13 of the 105 Central Committee members were included. In this connection it must not be forgotten that these groups of persons are congruent. With this composition, a clearly advanced leadership role of the party cannot be asserted.

The Protestant-Reformed and the Protestant-Lutheran church as well as the Jewish religious community and the Free Churches have one high-ranking representative each, the Roman Catholic Church even two. However, they were unable to induce one of the bishops or even Cardinal Lekai to become a candidate, in contrast to Bishop Bartha (Protestant Reformed) and Bishop Kaldy (Protestant Lutheran), president of the Lutheran World Federation, as well as Chief Rabbi Salgo, who died shortly after the election on 24 July 1985.

On the national list the four national minorities in Hungary (Germans, Romanians, Slovaks, South Slavs) are represented with one deputy each as well as the Federal Council of Hungarian Women, the cooperatives and the labor unions (see above). The Hungarian Academy of Sciences nominated three Presidium members as candidates. An actor and a sculptor who is also a member of the HNF Presidium, represent the fine arts. The last group is formed by 5 persons whose professional designation is indicated as retired persons. What is involved here are former high-ranking representatives of public life (2 former ministers, a former vice-mayor of Budapest, a former representative of the agricultural producer cooperatives and a former director general of the Hungarian news agency MTI), of whom three are members of the Presidential Council.

In summary, it is to be emphasized that the national list actually tries to represent the entire country, whereby the women with 5.7 percent and the economic sector (without any representative of industry or of the senior executives) are, however, clearly underrepresented. No effort is recognizable to clearly give preference to the party functionaries and the members of the government and to obtain safe seats in the parliament for them. But the national list forms only less than one tenth of the new parliament and its composition is considerably different from the group of the 351 direct seats.

The Direct Seats

If the composition of the 1985 parliament is compared with that of 1980, some clear differences are conspicuous. The comparison in Table 3 follows the occasionally difficult-to-comprehend categories of the Hungarian party parlance.

If the classification by occupations is examined and the figures[21] submitted by Sandor Barcs, President of the Mandate Commission and former president of the Hungarian news agency MTI, to parliament with those mentioned by Central Committee Secretary Istvan Horvath on 26 June 1985 in his speech to the MSZMP Central Committee, extensive differences attract notice in one point. Barcs spoke of 133 workers in parliament (=34.5 percent) while Horvath spoke of a share of 21 percent workers in parliament (=81 percent). A check of these figures by means of the occupational designations of the deputies in the list of candidates reveals that there are only 35 workers and 13 (mostly working in industry) foremen. A generous one tenth (depending on whether or not the foremen are included with the workers: 9.1 or 12.4 percent) of the deputies can be classed as workers.

The figures reveal a dilemma: The word "worker" is part of the name MSZMP while the realistic connection declines. So as not to lose the ideologically necessary

claim, the number of workers is artificially raised by changing categories. Thus Sandor Barcs spoke misleadingly of the "original occupations" of the deputies. The contradiction became evident in his other figures: 282 deputies have a university or college degrees. Almost three quarters of the parliament consist of academicians. A total of 113 deputies have a doctorate. If Sandor Barcs' figures are taken literally, then at least 29 "workers" with degrees sit in parliament.

The attempt to structure the occupational data of the deputies provided in the list of candidates leads to the following picture (Table 4). Managerial employees in industry from the director to the plant manager occupy one fourth of the seats. Managerial employees of the cooperatives in the broadest sense, especially from the agricultural sector, raise the share to nearly four tenths. The two quality controllers form a kind of hybrid, since they can no longer be regarded as managerial employees but on the other hand are removed from the workers. Foremen and workers have been discussed above.

Behind all these categories the peasants are also hidden whose dwindling share has not become visible at all up till now. Thus there are a department manager and a group manager, two plant managers, 4 workers and 2 foremen who are working in agriculture. Together with 40 agricultural producer cooperative chairmen and 2 state farm directors, there would be 52 deputies who have to be regarded as active in agriculture as their regular occupation and as "peasants" in the broadest sense of the word. Thus their share is three times that indicated by Sandor Barcs.

The group of employees mentioned in Table 3 is even more difficult to specify. It probably comprises those employed by the state, the municipality or economy who make their living by nonmanual, dependent work. But most of the intellectuals, too, make a living from such work (i.e. as white collar workers). To make distinctions is difficult here. Excluding the few self-employed persons, all deputies except for those expressly making a living from manual labor as workers and foremen could be so designated.

The professional functionaries form a group which officially does not exist. The labor union functionaries had to accept some considerable losses in this election. The SZOT president, Gaspar Sandor, as mentioned above, had been elected by means of the national list. The general secretary, Mehes (Budapest 44), only replaced on 4 March 1985, was directly elected while the present SZOT secretary, Istvan Gal (Tolna 3) and Sandor Nagy (Hajdu-Bihar 13) were defeated. Of the big labor unions, only the general secretary of the Agricultural and Forestry Workers Union (Pest 6) gained a seat, while his colleagues of the Chemistry Workers Union and of the Iron, Metal and Electric Energy Industry Workers Union (Budapest 67, Borsod 12) were defeated. The union secretaries of Budapest (district No. 40; in competition with a plant labor union secretary), of the counties of Bacs-Kiskun (4), Komarom (1) and Veszprem (13) as well as two plant labor union secretaries (Budapest 62, Heves 1) were, however, accepted by their voters.

The MSZMP functionaries also emerged from the election weakened by one third. While in 1980, 47 full-time party functionaries were deputies, their number was reduced to 33, and, if the national list deputies are deducted, to 26. A total

of 52 functionaries had been candidates. Of these 14 faced each other in 7 districts, which thus were safe for the party. Among the 26 victorious candidates here were one former and 2 active Central Committee secretaries, 3 Central Committee staff members, 11 party secretaries on county level, 4 on city level and 3 on plant level. In addition there is the former president of the Central Party Control Committee, Janos Brutyo and a very young and--basically contrary to all expectations--successful functionary: a local representative of the party youth organization KISZ, Gyula Szucs, defeated the Central Committee Secretary of long standing, former minister and confidant of Janos Kadar, Bela Biszku, in the runoff election with 50 percent more votes and relegated him to third place of the three-candidate competition in the main election and the runoff election (Szabolcs-Szatmar 16). The high voter participation of 97.9 and 97.6 percent, respectively, excludes the fortuitousness of the result as well as the fact that Szucs was able to widen his lead over Biszku from 2.8 to 12.1 percent. The voters decided clearly and consciously against the representative of the conservative wing in the MSZMP.

Table 5 offers a survey of how the party management is represented in parliament. The qualitative difference between the group represented on the national list and the group of those elected by direct vote is conspicuous. It is shown in the distribution of the Politburo members (10:2). Karoly Grosz was the only one not a candidate. Two of the 6 Central Committee secretaries were on the national list, two others were in competition, the other two (Istvan Horvath, who later commented on the result before the Central Committee, and Pal Lenard) did not become candidates.

Barely three tenths of the Central Committee members sit in the parliament in which they constitute a modest 8.03 percent. If only those with direct seats are considered, then the Central Committee members constitute only 4.56 percent. Nevertheless they are a group standing out from the mass because on the average 67.1 percent of the voters expressed their confidence in them. Thus they are a marked 8 percent above the national average. To rate this result as a vote in favor of the MSZMP would perhaps be rash since in most cases they hold more important positions outside the party which in the eyes of the voters undoubtedly frequently had priority. Various factors are decisive for the fact that they came off well: in addition to the personal popularity, the reward of office, occasionally also the habit and the lack of an attractive opponent. The question concerning possible manipulation raised in this connection cannot be answered on the basis of the available documents. Even though rumors might harden into suspicion in an individual case (for which there is no indication at this time), under no circumstances is it possible to assume a general line, as the negative election results show.

In addition to Bela Biszku, 7 functionaries were defeated on county level (including 5 who are retired); 9 on city level (including one retired); 4 on municipality level; 4 on enterprise level; one KISZ representative and two more prominent representatives of ideological indoctrination: Istvan Huszar, director of the MSZMP Party Historical Institute (Borsod 18) and Erno Molnar, director of the Research Institute for Marxism-Leninism of the Gyor colleges (Gyor-Sopron 3). Thus the number of defeated functionaries with 28 persons is nearly as big as that of the successful full-time functionaries with 33 persons (see Table 5).

How unsure the functionaries felt as candidates can be deduced from the fact that 5 functionaries did not stand for the runoff election following an inadequate election result on 8 June and abstained from being candidates again.[22] The weakened picture of the party organization (with a declining share from (1980) 13.3 percent to (1985) 8.6 percent) is in unexpected contradiction to the rising share of party members (from 1980) 71.6 percent to (1985) 77.0 percent).

Among the biggest losers of the election is its organizer: the HNF. As a result of the national list, its president, Gy. Kallai, and its general secretary, Pozsgay, had safe seats, while the vice-presidents, Mrs. Szentivanyi (Baranya 10) and L.S. Hegedus (Pest 24) did not succeed in acquiring the confidence of the voters. The HNF county secretaries of Hajdu-Bihar (district No. 8) and Szabolcs-Szatmar) (8) gained election to parliament while their colleagues from Baranya (1), Komarom (6) and Zala (2) were defeated. The HNF secretary of Budapest and deputy of many years (Budapest 56) entered parliament with a bare 50.1 percent; however, his colleagues from Kalocsa (Bacs-Kiskun 16) and Sarkad (Bekes 15) failed to do so. Thus in 7 of 10 cases the voters decided against the HNF.

The election was disastrous for the Association of Hungarian Resistance Fighters and Antifascists. Neither of their two candidates, General Secretary Ispanovits (Bacs-Kiskun 18) or Vice-President Uszta (Heves 11) was elected. In view of the role played by the association in public at all festive events, the realistic assessment of its importance was expressed here by the voter.

The representatives of all national minorities consciously nominated for the first time received their parliamentary seats with equal representation by means of the national list. (In this connection it should be noted that the gypsies do not possess the status of a national minority). The representatives of the nationalities did not find any response in the case of the direct seats. Thus Janos Budai, the director of the faculty and of the "Nicolae Balescu" Nationalities School (ranging from the elementary stage up to the secondary school) did not succeed in mobilizing the voters who again put their trust in the former deputy and meanwhile retired teacher of the local Hungarian elementary school, Mrs. Laszlo Sebesi (Bekes 6). This vote of 74.1 percent of the ballots cannot be called anything but overwhelming.

The following group consists of the members of the government, administration and of the security organs. The deputies who had received a place on the national list from the circle of the government have already been mentioned: Parliamentary President Sarlos, Prime Minister Lazar, State President Losonczi, his two deputies, and the secretary and 10 (part-time) members of the Presidential Council. In addition, based on the voter preferences, Foreign Minister Varkonyi (Budapest 14), Deputy Prime Minister Marothy (Bekes 13), Deputy Parliamentary President Cservenka (Pest 4) and Deputy Director of the Office for Standards Suto (Vas 9) entered parliament. Thus of the 19 members of the Council of Ministers 16 are not members of the parliament.

In contrast (according to the constitution) all members of the Presidential Council are elected by the parliament from its own ranks. Of the members elected in 1980, four did not become candidates. Three former members of the Presidential Council failed to be reelected and lost their electoral districts: Mrs Zoltan Desi (Budapest 7), Ignac Pioker (Budapest 12) and Gyula Uszta (Heves 11), the general secretary of the partisan association. In the election for the Presidential Council on 28 June 1985, the 14 reelected deputies from the circle of the former Presidential Council were reelected. The remaining 7 seats were obtained by 3 representatives from the national list and 4 direct seatholders. Four of the 7 new members of the Presidential Council sit in parliament for the first time. It is noteworthy that direct seatholders were elected members of the Presidential Council who had achieved outstandingly good election results.

The voters were quite discriminating precisely among the former officeholders who were candidates for election: Antal Apro (Csongrad 1), the former parliamentary president and companion of Kadar and former ministers Puja (Bekes 8) and Biro (Gyor-Sopron 6) were elected, while former ministers Benkei (Budapest 3) and Szurdi (Budapest 2) and even former prime minister Fock (Gyor-Sopron 5) were rejected.

In the ranks of ministers in office or former ministers, two names and electoral districts are conspicuous. During the election campaign, news reports from Foreign Minister Varkonyi's electoral district (Budapest 14) were published in various Western newspapers since a member of the unorganized opposition, Miklos Tamas-Gaspar, competed as an additional candidate. Tamas-Gaspar comes from Transylvania, is a philosopher and a committed fighter for the rights of the 2-million Hungarian minority living in Romania. Since Hungarian foreign policy follows a road of very small steps in this question which is attacked by opposition circles as ineffective, the exponents of the two groups clashed at the nominating meeting. However, after the second election meeting with a 3-hour debate of the opponents, Tamas-Gaspar collected only a total of 135 out of 1018 votes. Thus he failed to get the necessary third of the votes for the nomination.

In the neighboring electoral district Budapest 13, another opposition member competed for a candidacy, the architect Laszlo Rajk, who as a son of the Laszlo Rajk executed in 1949 and rehabilitated in 1956, represents a kind of "figurehead" of the opposition. At the two nominating meetings he received 468 of 1611 votes and with 29.05 percent only barely failed to get the nomination after having received more than one third of the votes at the first meeting.

The reasons for the failure of the two differ. For one thing, the difference in the vote for Tamas-Gaspar and Rajk (and the even worse result of other opposition members) is an indicator of their name recognition among the people.

The Western press undoubtedly overestimates the influence and the broad effect of the opposition, the reason why the expectation of that press was perhaps too great. On the other hand, self-censorship of the citizens ("the scissors in the head") to which they have been accustomed for 40 years limits from the start the election or nomination chances of opposition candidates--even without specific opposition from state or party. Realistically the candidates had to expect the lacking courage to express support for the opposition. Tamas-Gaspar's bad performance moreover may be attributable to Peter Varkonyi's popularity, which he has achieved at home and abroad during the short period in office since 8 July 1983. Even though in the 8 June election he was opposed by two additional candidates, he received 62.1 percent of the votes while his opposing candidates each remained below 25 percent.

The other noteworthy electoral district is in Battonya (Bekes 8). It is the traditional electoral district of former foreign minister Frigyes Puja. His standing in the MSZMP quickly declined after his resignation in 1983. As sole former foreign minister he did not get a Central Committee seat at the 13th Party Congress in March 1985. He also had not been nominated as a parliamentary candidate by the HNF while his predecessor in office, Janos Peter, had received a safe seat on the national list. At the election meetings Puja was, however, nominated by his fellow citizens and with 54.8 percent of the votes against the local agricultural producer cooperative chairman (16.3 percent) and the municipal council chairman (28.9 percent) achieved a clear victory even though it was not as convincing a victory as that of Varkonyi.

Of the administrative officials who in most cases took part in two elections simultaneously--on the one hand, for parliament, on the other hand for the regional council--only one representative could be noted on the national list, namely Pesta, the former deputy chairman of the city council, thus vice-mayor of Budapest. For direct seats 31 council chairmen were candidates for election, of whom 20 (=64.5 percent) were elected to parliament. Thus the result is by far less positive than in the case of the council elections. There of all 1511 council chairmen 1508 were candidates for election and 1471 of them (=97.4 percent) were confirmed. In the election to the parliament, the evaluation by the voters is remarkable: of the 12 municipal council chairmen only 6 (and of them 2 only in the runoff election) were elected, but 9 of 11 county council chairmen, 5 of 8 mayors up for election were confirmed. The most prominent loser in this connection is the vice-mayor of Budapest, Richard Nagy (Budapest 62), while his colleague Istvan Stadinger (Budapest 6) and Chief Mayor Zoltan Szepvolgyi (Budapest 57) won.

The police is represented in the parliament solely by Dr Antal Toth (Bacs-Kiskun 16), who is deputy director of the county police directorate in Kalocsa and was able to prevail against the city HNF secretary.

The Hungarian People's Army sends 3 officers and one civilian to the parliament. While the civilian employee Karoly Viola (Pest 14) successfully competed with an employee of the agricultural producer cooperatives, in the other three electoral districts soldiers faced one another. This competition among equals is interesting for two reasons. First of all it is remarkable that the voters in each case preferred the higher-rank officer: a major general over a colonel (Fejer 6) and a lieutenant colonel (Veszprem 12) and a Lieutenant general over a colonel (Pest 7).

The clergy are included in the professional group of the intellectuals. Their large share of seats on the national list (17 percent) indicates that the HNF regards them moreover as representatives of important mass organizations. According to Hungary's historical tradition, all religious persuasions are treated the same way. As mentioned above, the national list includes 2 Catholic priests, 1 Reformed and 1 Lutheran clergyman, 1 rabbi and 1 representative of the Free Churches. Clergymen were successful candidates for two additional direct seats. Here, too, 2 similar candidates faced one another: the Reformed bishop of Miskolc, Laszlo Kurti, defeated his deputy (Borsod 2), the president of the College for Religious Doctrine, Dr Istvan Pregun, was victorious over the director of the Greek-Catholic episcopate (Szabolcs-Szatmar 1). With Istvan Pregun the last denomination not represented, the Greek Catholic rite, received representation in the parliament. The high rank of the church representatives is notable while in contrast clergymen are absent from the municipality sector. The reasons for that probably have to do with intra-church discussions on the strength of the involvement in state organizations. These problems became known especially from the Catholic Church which is torn between the desire for clerical opposition in atheist states, the aversion towards state associations of priests such as "Pacem in terris" in the CSSR and the discussion concerning the Central American liberation theology. As statements by Cardinal Lekai[24] confirm, these thoughts also governed the Hungarian theologists during the election campaign.

The trend of intellectualizing the parliament discussed above corresponds to the fact that an excessive share of teachers, who did not have a single representative on the national list, received direct seats (8 percent). The fact of their being widely known in the electoral district may have been a contributing factor hereby. Most of the 28 pedagogues are school directors (14) and university and college teachers (5).

The profession close to the people, which was mentioned in the case of the teachers, of course also applies to the medical profession even more. Of the latter's 32 representatives, 7 are veterinarians who are of especially great importance for Hungary, which continues to be strongly agriculturally oriented. The confidence of the voters in their physicians is shown by the election of the district physician of Pomaz (near Szentendre), Dr Janos Juhar, who defeated the former deputy and HNF vice-president with 58.7 to 15.7 percent of the votes (Pest 24).

With the 11 engineers among the deputies, the most varied branches of this wide-ranging professional field are represented, which ranges from heavy industry to the energy industry and to the foodstuffs industry. If the technical intelligentsia is not included among the managerial personnel and directors, then the technical intelligentsia would be underrepresented by the 11 engineers alone.

The three most important branches of jurisprudence have one representative each in the parliament. The following were elected: the president of the Budapest bar association, Jeno Horvath, (Budapest 1), the senior public prosecutor of Hajdu-Bihar County, Csaba Kreszti, (Hajdu-Bihar 4) and the legal officer of an industrial cooperative, Frigyes Tallassy (Budapest 24). While the first two represent traditional areas, F. Tallassy represents a field of activity which gains importance with the increasing diversification of the Hungarian economy to more smaller, competitive and independently operating enterprises.

The four deputies identified as staff members of the Hungarian Academy of Sciences are high-ranking scientists in their fields: Bruno F. Straub and Janos Szentagothai are biologists and Jozsef Bognar and Rezso Nyers are economists. Only Rezso Nyers, who can be regarded as the "father" of the New Economic Mechanism and remains a critical observer and adviser following his resignation as Central Committee secretary, faced the voters (Bacs-Kiskun 1), while the others had their names on the national list. However, another biologist of the Academy was unable to gain the confidence of the voters (Csongrad 6).

The scientific-intellectual professions include a female librarian of the "Ervin Szabo" City Library (Budapest 21) as well as 6 journalists. While the general director of the Hungarian news agency MTI, Barcs, had a place on the national list, the successor in his office, Burjan, did not gain the confidence of the voters. The publishers of the newspapers PETOFI NEPE, NEPSZAVA and MAGYAR FILMHIRADO (Bacs-Kiskun 5, Borsod 19, Budapest 47) were elected in contrast to the publisher of MAGYAR NEMZET (Budapest 36), his predecessor (Budapest 18) and the former publisher of ESTI HIRLAP (Budapest 38). The main staff member of the Hungarian radio, Karoly Eke, (Csongrad 10) and the editor and reporter of the Szeged MTV television studio, Zoltan Kiraly, (Csongrad 5) prevailed only in the runoff election but in doing so achieved above average good results of 65.2 and 81.3 percent. Zoltan Kiraly thus achieved the fifth best result nationally while the result of Karoly Eke deserves attention because he was not nominated until the runoff election. The "new media" thus fared clearly better than the print media with their old and new representatives. But overall the election result reveals little concerning the view of the electorate of the press and information policy of the government.

The last professional group among the deputies consists of the representatives of the fine arts. Two prominent artists, the sculptor I. Varga and the actor F. Kallai, who are involved in various organizations,were placed on the national list. The actor Banffy and the opera singer Leblanc were able to prevail against their nationally renowned competitors (Budapest 4: against the vice-president of the National Lawyers Council; Budapest 67: against the general secretary of the Chemical Workers Union). Their voters apparently saw more involvement in their case than in the case of the officeholders of many years. The past deputy, the actor Avar (Budapest 17) was able to hold on to his seat.

The five biggest groups of deputies consist of directors (56 seats), agricultural producer cooperative chairmen (40), workers (35), MSZMP functionaries (33) and physicians (32), who, taken together, constitute half of the parliament membership. The representatives of the mass organizations, the government, administration and security organs constitute only about one fifth of the deputies. Accordingly characteristic of the composition of the parliament on the one hand is the high level of education and on the other hand the preponderance of the economic leaders and managerial staff (150 seats) as well as the intelligentsia (97 seats),who combined hold nearly a two-thirds majority.

The Reelected Deputies

In comparing the results of the 1985 election with those preceding it, the question arises what change has taken place among the officeholders and to what degree deputies have found the confidence of the electorate once again. As mentioned above, two-thirds of the 35 members of the national list and three-fourths of the Central Committee members among the deputies had already belonged to the parliament in the previous legislative period.

Of the 352 deputies of the old parliament, 183 (thus about one half) were candidates again. Of them 104 were immediately elected, 60 were rejected. In the electoral districts in which a runoff election was necessary, 4 former deputies withdrew from the runoff election. Of the other 15, 6 were confirmed in the runoff election. Overall the voters rejected 40 percent of the deputies who had become candidates for reelection.

Nevertheless an incumbent's advantage in the reelection can be recognized. Thus the 183 candidates constituted 23.9 percent of all candidates. But in terms of all direct mandates, the share of the reelected 110 increased to 31.3 percent. It must not be forgotten that in this so advantageously acting increase of the share that in the case of this group there could not be any competition among equals and thus no "lost" candidacies.

The incumbent bonus is also expressed in another figure. The voters gave them 60.4 percent of their votes in the average of the electoral districts and thus one percent more than the other 241 direct seatholders. Thus the reelected deputies possessed the special confidence of the voters while the votes out of habit kept within bounds. The deputies who were not reelected were consciously rejected, such as the former deputy of Kapuvar and first secretary of the county party committee, Bela Hary, who received only 8.4 percent of the votes (Gyor-Sopron 12).

Overall the reelected deputies constituted only one third of the new parliament. Of the 386 deputies, 244 were elected to the parliament for the first time. They, in particular, will shape the work of the coming legislative period.

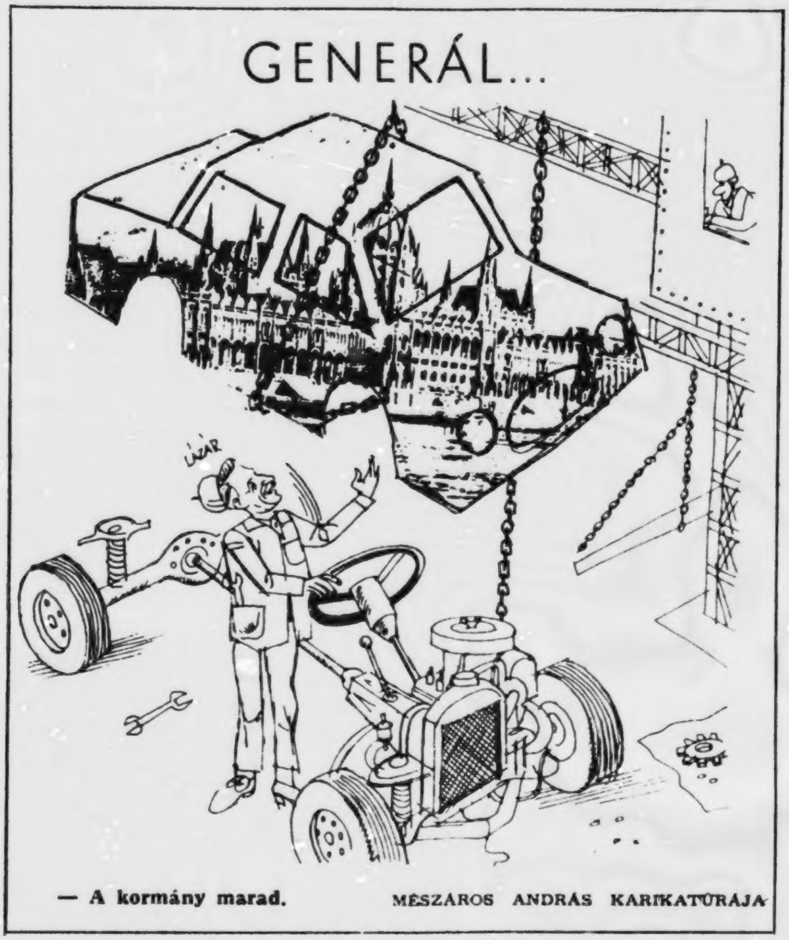
The Prospect

The Presidential Council on 24 June 1985 convened the elected parliament for the constituent session for 28 June 1985, in accordance with Article 28, paragraph 5 of the constitution.[25]

The reports on this session[26] record painfully precisely the long accustomed pattern of the parliamentary proceedings. There were no changes in the important positions of the president of the parliament and his deputies. The cabinet was confirmed without change. It was not until the election to the Presidential Council and of the individual committees that the results of the election had any effect on their composition. But nothing happened that would indicate any change.

With a scathing pen Andras Meszaros recorded the result: He pictured Prime Minister Lazar as a car mechanic at a car made of wheels, an engine, steering wheel and transmission. A new body is lowered over the frame which shows the view of the parliament building. The caption reads quite clearly: "The Government Remains." (A kormany marad). Here the parliament is shown as an embellishment without any influence on the movement of the vehicle. Thus nothing significant would have changed? The incomplete heading "General..." could be completed in different ways. In this sense, if the government were to assess the election exclusively as a "general confirmation," then all beginnings and efforts of the 1985 election and of its election campaign were in vain.

But the signs do not point in this direction. The mass organizations have no reason for self-satisfaction. Even before the constituent session of the parliament, the MSZMP Central Committee met on 26 June 1985 and the Presidium



GENERÁL...
LÁZÁR
— A kormány marad.
MÉSZÁROS ANDRÁS KARIKATÚRÁJA

Caption: GENERAL...

"The government remains"

NEPSZABADSAG, No. 151 of 29 June 1985, p 21; cartoon by Andras Meszaros

of the HNF on 27 June 1985. As usual nothing became known of the disputes within these bodies. While the HNF did not decide on anything but the convening of the Eighth HNF Congress for 13 December 1985, the Central Committee published a communique[28] whose second part dealt with the election. Aside from some customary sentences of the self-confirming party language, aftereffects of the surprise that the election must have provided for some can be noted: "The elections deepened socialist democracy and enriched it by some new features." The willingness to include the new developments and not to nip them in the bud is reflected in the advice: "The deputies and council members should make use in their work of all the generally interesting proposals which the citizens made in the election discussions." In the HNF, too, which faced the development with much greater reservation, the intention was stated earlier that "in the future public opinion would have to be sounded out much more carefully."[29]

In the future this may possibly have the effect for the citizen of indirect, for the deputy of direct representation of interests and participation in political decisions without having to follow the road through the organizations (HNF or MSZMP). Thus the way is opened for less ideological tutelage of the citizen and for more democratization and freedom.

The main questions in the discussion between Western and Hungarian commentators were whether these elections involved "free" elections or whether,on the basis of the existing laws and present social trends,"free" elections can develop. Presentation of the problems and fundamental question raised in this connection would require a more detailed commentary. One aspect which is part of the narrow field of examining an election is the question concerning the importance of the candidates nominated by the voter meetings and sometimes referred to as "independent." Here it must not be forgotten under any circumstances that acceptance of the HNF program was obligatory for all. The nomination of Frigyes Puja alone, who belongs to the party conservatives and is no longer a Central Committee member,makes the designation questionable. On account of the commitment to the common HNF program, the question concerning the nonparty persons also makes it difficult to respond with a definite assessment. Occasionally the party members are more critical than the nonparty persons. The dubiousness of figures only is shown by the fact that under Rakosi there were 30 percent nonparty persons in the parliament who did not possess opposition character in the least. During the past 30 years the share of the nonparty persons increased from 18.3 percent in 1958 to 38.9 percent in 1975 and from that time declined again: 24.8 percent (1980), 23.0 percent (1985). Thus it is in the order of magnitude that prevailed at the time of the introduction of the economic reforms in the 60's.

The more pronounced formation of party groups within the HNF and in the MSZMP permits ideologically divergent wings or groupings to emerge more and more clearly. The fact that the voter has seen and assessed these differences is shown by his behavior. Perhaps this also explains the fact that fewer party functionaries but more party comrades are elected because more voters identify with part of the spectrum within the ideologically liberalized party. Thus the approval applies less to the party in general but more to the wing whose representative was elected. Hereby the active and economically liberal representatives were elected for whom the election of National Bank Vice-President Janos Fekete can be mentioned as the most prominent example.

The voter also expressed honestly how he views the balance of power and also saw real possibilities for action in his sense. Thus the voters considered themselves better represented by the director than by the party secretary of their factory (here LEHEL) and placed their confidence with 71.3 percent in the one who had represented them before in the parliament (Szolnok 15). In general the labor unions were rated low (even on the national list), the Association of Resistance Fighters and Antifascists was totally rejected and confidence was withdrawn from wide circles of the HNF. Former officeholders in the state--regardless of whether they had been ministers or council chairmen--or in the party had hardly any chances with the voters. In such cases, the voters preferred the local representatives to the well known but powerless national figures. As an example, the defeat of Jeno Fock by the local agricultural producer cooperative chairman (Gyor-Sopron 5) can be mentioned. The emphasis of the regional element is an outgrowth of the 1966 electoral district reform and the repeatedly emphasized close relationship between deputy and electoral district. Even during the election campaign speeches, the emphasis of the regional relationship came to the fore and also determined the nominations.

In conclusion it can be stated that the Hungarian voter knew how to use the greater and freer scope granted to him. Thus the hope exists that the will of the voter may be converted into the deed in an active parliament. The future will show whether or not this can be done.

PZPR MEETINGS, ACTIVITIES REPORTED

Suggestions, Complaints Commissions

Warsaw ZYCIE WARSZAWY in Polish 12 Nov 85 p 2

[PAP report edited by (sl) under 'Yesterday in the Nation' rubric]

[Text] The implementation of the tasks ensuing from the resolution of the Ninth PZPR Central Committee Plenum by the province party organizations in Lublin, Szczecin, Tarnobrzeg and Wroclaw was a major topic of discussion at the Commission for Suggestions, Complaints and Signals from the Population under the PZPR Central Committee.

During the discussion, chaired by the commission's chairman Albin Siwak, member of the Politburo of the PZPR Central Committee, mention was made of the effectiveness of the party's actions in resolving problems with which citizens turn to PZPR echelons. As commission members pointed out, the implementation of the aforementioned resolution, particularly in the context of the recent elections to the Sejm, was and is contributing to strengthening the society's trust in the party. The Central Committee received several hundred letters concerning the elections. The suggestions they contain were reflected in the pre-election campaign. Such letters have also been received by the province echelons.

A report on the letters received by the Central Committee this year was presented by Director of the Office for Letters and Inspections under the PZPR Central Committee Marian Kot. During the first 3 quarters of this year more than 43,000 letters were received and nearly 5,000 citizens presented themselves in person. Compared with a like period last year, these figures are higher.

Law, Order Commission

Warsaw ZYCIE WARSZAWY in Polish 12 Nov 85 p 2

[PAP report edited by (sl) under 'Yesterday in the Nation' rubric]

[Text] The Commission for Law and Order under the PZPR Central Committee evaluated at a session in Warsaw the sociopolitical situation within the lawyer community. The deliberations were chaired by the commission's vice chairman Deputy Minister for Internal Affairs Lucjan Czubinski.

In the recent past, it was emphasized, negative and disturbing phenomena used to occur within the lawyer community. Certain representatives of the bar displayed attitudes hostile toward the socialist state. The lawyer community has begun to display tendencies toward self-isolation and restriction of access to the profession. A symptom of this unhealthy situation was the commencement of 74 disciplinary proceedings against lawyers during the first half of 1985. They concerned chiefly (54 cases) incomplete fulfillment of professional obligations.

The new decree regulating the bar that was passed in 1982 constituted -- it was stressed in the discussion -- an expression of political, professional and moral trust in the lawyer community. At present, it was stated, the situation is slowly but tangibly improving.

Bloc Journalists Discuss Plenum Topics

Warsaw ZYCIE WARSZAWY in Polish 13 Nov 85 p 2

["Topics of 22nd PZPR Central Committee Plenum Subject of Press Conference in Warsaw" -- PAP report]

[Text] The course and topics of the 22nd PZPR Central Committee Plenum were the subject of a press conference for domestic and foreign journalists held in Warsaw on 12 [Nov 85].

Concerning the topics of the party plenum, which ended on 11 [Nov 85], Jerzy Majka offered the reminder that this plenum represented a continuation of the principal topic of the 19th PZPR Central Committee Plenum, namely, the role and tasks of the intelligentsia in this country's socialist development. The 19th Plenum had at the time authorized the Commission for Resolutions and Recommendations to draft, during the period preceding the current plenum, an elaborate -- and also based on the opinions of artistic, scientific and academic-educational communities -- program for implementing the Central Committee resolution on the role and tasks of the intelligentsia in work for this country. This innovative solution enriches the collegial work of the Central Committee and contributes to strengthening its programming role.

The speaker devoted considerable attention to the resolution of the 22nd Plenum, pointing out that it emphasizes the importance of the alliance between the working class and peasantry and the intelligentsia as well as the need for a more effective utilization of the creative endeavors of all intelligentsia milieux in the nationwide cause of strengthening the socialist fatherland.

J. Majka also answered questions from journalists.

Warsaw PZPR Committee Plenum

Warsaw TRYBUNA LUDU in Polish 15 Nov 85 pp 1,5

["Warsaw PZPR Committee Plenum"; subtitled "With the Participation of Wojciech Jaruzelski" and "Janusz Kubasiewicz Becomes First Province Committee Secretary" -- PAP report; passages within slantlines printed in boldface]

[Text] /Organizational matters were on 14 [Nov 85] the subject of a plenary session of the Warsaw PZPR Committee, attended by First Secretary of the PZPR Central Committee Wojciech Jaruzelski./

In connection with his becoming a secretary of the PZPR Central Committee, Marian Wozniak requested the plenum to relieve him from membership in the Warsaw PZPR Committee as well as from the duties he until then exercised as first secretary of the latter committee.

/On behalf of the Politburo of the PZPR Central Committee, first secretary of the party Central Committee recommended Janusz Kubasiewicz, heretofore director of the Socio-Legal Department under the PZPR Central Committee, for the post of first secretary of the Warsaw PZPR Committee./

/J. Kubasiewicz was elected to that post by secret balloting during the plenum of the Warsaw PZPR Committee./

/Toward the end of the deliberations W. Jaruzelski again took the floor and discussed the next tasks of party activity during the period preceding the 10th PZPR Congress, and especially the directions of action of the Warsaw party organization./

The session was attended by: Member of the Politburo of the PZPR Central Committee Albin Siwak, Candidate Member of the Politburo and Secretary of the PZPR Central Committee Wlodzimierz Mokrzyszczak, and Director of the Cadre Policy Department under the PZPR Central Committee Wladyslaw Honkisz.

Following the plenary session of the Warsaw PZPR Committee Marian Wozniak commented as follows in a talk with journalists:

"I find it difficult to part with the Warsaw party organization, but as a Sejm deputy and member of the Warsaw Club of Sejm Deputies, I'll after all retain my ties to the capital city and work for it. This is an opportunity to assess what we have accomplished jointly with the Warsaw party aktiv. Much has been done to promote the consolidation of party ranks in the ideological sphere as well. Even so, many important tasks face the Warsaw party organization."

/Janusz Kubasiewicz stressed that he viewed his role as: "Primarily that of effectively coordinating the activities of elements of our organization. The tasks are many and hence their proper prioritization is important. My operating principle is that of being among the people as often as possible. These encounters provide me with inspiration for my work."/

Army Committees Meet

Warsaw TRYBUNA LUDU in Polish 15 Nov 85 p 2

["Conference of First Secretaries of Party Committees in the Army" -- PAP]

[Text] On 14 [Nov 85] in Warsaw was held a conference of first secretaries of the party committees of military districts, the armed services and military academies. The participants presented recommendations for further improving the quality and effectiveness of the party's work in the armed forces. Directions and tasks of party work in the army ensuing from preparations for the 10th PZPR Congress were discussed. The conference was attended by General of Arms Jozef Baryla, chief of the Main Political Directorate of the Polish Army and deputy minister of national defense.

Bloc Party Conference on Public Opinion

Warsaw TRYBUNA LUDU in Polish 16-17 Nov 85 p 6

["Public Opinion Under Socialism: International Party Conference" -- PAP report; passages within slantlines printed in boldface]

[Text] /In Mierki near Olsztyn was held a scientific conference on public opinion under socialism, organized by the Academy of Social Sciences and the Information Department of the PZPR Central Committee. It was attended by scientists from the USSR. Bulgaria, the GDR, Czechoslovakia, Hungary, Cuba and Poland as well as by practitioners-activists from the public opinion research centers of party echelons./

/The 3-day conference represented a confrontation of views of eminent representatives of science engaging in surveys of public opinion in a functioning socialist society./ This symposium was intended to derive general theories from the experience of recent years in this socially important domain, exchange views with fraternal communist parties on ways and means of conducting ideological-political work and counteract hostile propaganda as well as continually improve the techniques of public opinion research.

/Public opinion research is intended to determine integrally the state of political awareness of the society, and it provides source material for determining the trends and tendencies composing the picture of the political awareness of nations. This avenue of approach makes it possible to raise to a qualitatively higher level the bonds between the party's political practice and the theory of Marxism-Leninism./

It was emphasized that the unremitting concern for maintaining a high level of activism of the masses is a precondition for socialist people's rule, and it also offers the possibility of perfecting the institutions of socialist democracy. From the principles of communist ideology ensues the duty of obtaining the opinion of the masses and gaining their support for particular political decisions. Hence, public opinion surveys serve to diagnose and prognosticate the political situation much more precisely. All this is a significant step forward on the road toward releasing the potential latent in the working people of the socialist society. The significance of this problem is emphasized by the draft "Program of the Communist Party of the Soviet Union," in which we read: /"A successful accomplishment of the tasks outlined is linked by the party to enhancing the role of the human element. A socialist society cannot function effectively unless it explores new roads for the development of the creative activity of the masses in all domains of social life. The greater the scale of the historic goals, the more important is a proprietary-minded, committed, responsible, conscious and active participation of the millions in achieving them./ The tasks presented are particularly important from not only the practical-political and theoretical-research aspects but also from the social-ethical aspect. They reflect the need to intensify the intellectual and organizational efforts of the parties and their research centers. This precisely should point to the need for the integration and cooperation of the fraternal communist and worker parties.

The need to develop cooperation and intensify the efforts of the parties in this respect was pointed out in the papers presented by: Professor A. K. Yuledov, chairperson of the Department of Social Psychology at the Academy of Social Sciences under the CPSU Central Committee; J. Kopel, deputy director of the Information Department under the PZPR Central Committee; Docent S. Kusmierski, director of the Institute of Social Psychology and the Theory of Propaganda, Academy of Social Sciences under the PZPR Central Committee; and Docent S. Kwiatkowski, director of the Public Opinion Research Center.

This international symposium commenced with a meeting between Candidate Member of the Politburo and Secretary of the PZPR Central Committee Jan Glowczyk and the foreign guests. The conference itself was inaugurated by Jerzy Majka, editor-in-chief of TRYBUNA LUDU.

The symposium participants worked in four problem sections: The Party's Role in Shaping Public Opinion; Tasks of the Ideological Front in Counteracting Internal and External Diversionary Propaganda; The Mass Media and their Opinion-Shaping Role; and Methodological Experience of Socialist Public Opinion Research Centers.

University Meetings on Student Activism

Warsaw TRYBUNA LUDU in Polish 18 Nov 85 p 2

["Conference of Secretaries of Higher-School PZPR Committees" -- PAP report]

[Excerpt] On 15-16 [Nov 85] was held in Warsaw a conference of the secretaries of PZPR higher-school committees dealing with problems of work with students. The conference was organized by the Department of Science and Education under the PZPR Central Committee and the Youth Department under the PZPR Central Committee.

The tasks of higher-school party organizations in the student community were discussed, the educational activity so far in higher schools was critically appraised, and attention was drawn to the need for greater activism in this field by all academic instructors and higher-education administrators. The nature, forms and methods of party work with students werre discussed and the related experience in discrete higher academic institutions was exchanged.

The conference was chaired by Professor Bronislaw Ratus, director of the Department of Science and Education under the PZPR Central Committee. It was attended by the Director of the Youth Department under the Central Committee Leszek Miller.

Provincial Secretaries on Cultural Policies

Warsaw TRYBUNA LUDU in Polish 19 Nov p 2

["Party Policy on Culture: Conference of PZPR Province Committee Secretaries" -- PAP report]

[Text] /On 18 [Nov 85] was held at the PZPR Central Committee a conference of the province party committee secretaries responsible for cultural matters. The meeting was devoted to discussing problems relating to the policies and activities of the party in the cultural field, the sociopolitical situation of the artistic community and the intentions of the Culture Department under the Central Committee for the immediate future and in the course of work prior to the 10th PZPR Congress/ [emphasized].

The discussion was inaugurated by an address delivered by the Director of the Culture Department under the Central Committee Witold Nawrocki concerning the current tasks in implementing the party's cultural policy. He stressed the tangible improvement in the sociopolitical situation of culture and the growth of the party's activism within the artistic community, and he presented the text of the resolution adopted at the last PZPR Central Committee plenum concerning the implementation of the recommendations of the 19th plenary session of the PZPR Central Committee. The chair, Central Committee Secretary Waldemar Swirgon, focused his attention on evaluating the current sociopolitical situation in the cultural community following the success-crowned elections to the Sejm. He also presented the principal tasks facing the party echelons as regards culture.

Wroclaw Committee Plenum

Warsaw TRYBUNA LUDU in Polish 21 Nov 85 pp 1,2

[[Article by Czeslaw Kubasik: "The Recommendations Cannot Be Disregarded: Wroclaw Province PZPR Committee Plenum"; passages within slantlines published in boldface]

[Excerpts] /(Own information) At the plenary session of the Wroclaw Province PZPR Committee held on 20 [Nov 85] the campaign for elections to PRL Sejm was evaluated. On this basis, further directions of activity of the province party echelon in strengthening socialist democracy and the leading role of the party as well as in stabilizing sociopolitical and economic life were outlined./

Both the report of the executive board and the discussion evaluated highly the participation of the party aktiv in the electoral campaign. Party ranks were further consolidated and the authority and membership of the PZPR have grown, with the new members being chiefly young representatives of the working class.

/Referring to the preparations for the 10th Party Congress and the prior reports-election party campaign, Deputy Director of the Central Wroclaw TV Studio Stanislaw Wolny declared that the good experience gained during the last campaign should be exploited to avoid routinism and schematism in the mass media./

The members of the plenum also were briefed on the activities of the following commissions under the PZPR Province Committee: Agriculture and Food Management as well as Sociopolitical Policy and the Reform.

The plenary session was chaired by First Secretary of the PZPR Province Committee Zdzislaw Balicki.

Warsaw Executive Committee Meeting

Warsaw TRYBUNA LUDU in Polish 22 Nov 85 p 5

[Unattributed report: "From the Work of the Executive Board of the PZPR Province Committee"]

[Text] On 21 [Nov 85] was held a circuit session of the Executive Board of the Warsaw PZPR Committee. Fifteen teams met with the party aktivs of borough committees and Regional Centers of Party Work. Work intended to further strengthen the party and its basic elements and echelons was jointly evaluated.

The visits by party echelons was intended to improve the drafting of the documents that will be considered at the plenary session of the Warsaw PZPR Committee on 6 December of this year.

The work of the Executive Board was directed by First Province Committee Secretary Janusz Kubasiewicz.

Military Leadership on Ideology

Warsaw ZYCIE WARSZAWY in Polish 23-24 Nov 85 p 2

[PAP report under the rubric 'Yesterday in the Nation']

[Text] In Warsaw was held a conference on ideology and theory attended by the higher command of the armed forces of the PRL. Main directions of the nation's economic development and basic aspects of the international situation and the ensuing ideological-upbringing and political tasks were presented by the candidate members of the Politburo: Central Committee Secretary Wlodzimierz Mokrzyszczak and Minister of Foreign Affairs Marian Orzechowski, and also by PZPR Central Committee Secretary Waldemar Swirgon.

The conference participants also were briefed on the country's internal situation, the state's security problems and the government's intentions regarding cultural policy.

The conference was attended by General of the Army Florian Sliwicki, candidate member of the Politburo of the PZPR Central Committee and minister of national defense.

Jaruzelski Meets Party Union Directors

Warsaw TRYBUNA LUDU in Polish 25 Nov 85 p 1

[Unattributed report: "First Central Committee Secretary Met With the Heads of the Trade Union of PZPR Employees"; passages within slantlines published in boldface]

[Text] /First PZPR Central Committee Secretary Wojciech Jaruzelski met on 23 [Nov 85] with Chairman of the Trade Union of Party Employees Wojciech Wisniewski and other heads of the union. The meeting was also attended by representatives of plant trade union boards from the major province committees./

/The representatives of the union representing party employees described the activities of their organization./ They stressed that the work and initiatives of their organization promote the activism and commitment of its membership to service to the party and the society. Also discussed were questions of advancing professional and occupational skills, shaping exemplary moral-political attitudes and interpersonal relations and strengthening the bonds with the party masses, as well the working and living conditions of party employees.

/First PZPR Central Committee Secretary shed light on the tasks of the party and its political apparatus on the eve of the 10th PZPR Congress. He emphasized at the same time the well-disposed attitude of the party leadership to the trade-union elements and wished them fruitful work./

The meeting was also attended by the Central Committee secretaries Marian Wozniak and Wlodzimierz Mokrzyszczak.

Socio-Political Book Committee

Warsaw RZECZPOSPOLITA in Polish 26 Nov 85 p 2

[Unattributed report under "Party Activities" rubric: "Session of the Council for Socio-Political Books"]

[Text] /(C) On 25 [Nov 85] was held in Warsaw a regular meeting of the Council for Socio-Political Books under the PZPR Central Committee/ [emphasized]. This time the meeting was intended to review the editorial experience and accomplishments during the years 1982-1985 and the publishing plans of state and cooperative publishing houses for the period until 1990 as regards implementing the program for historical education, with special consideration of publications dealing with recent history.

The session was attended by, among others: the council's chairman PZPR Central Committee Secretary Henryk Bednarski and the Director of the Ideology Department under the PZPR Central Committee Wladyslaw Loranc.

Cultural Commission

Warsaw RZECZPOSPOLITA in Polish 26 Nov 85 p 2

[Unattributed report under'Party Activities' rubric: "Deliberations of Cultural Commission"]

[Text] /(C) On 25 [Nov 85] the Culture Commission under the PZPR Central Committee discussed the status and problems of mass and stage entertainment/ [emphasized]. Polish entertainment was evaluated and the main directions of planned legal-organizational reforms in this respect were disscussed.

The deliberations were chaired by PZPR Central Committee Secretary Waldemar Swirgon.

Provincial Committees Meet

Warsaw RZECZPOSPOLITA in Polish 26 Nov 85 p 2

[Unattributed report under 'Party Activities' rubric: PZPR Province Committee Plenums"; passages within slantlines printed in boldface]

[Text] In Szczecin:

/(C) The tasks of party members and organizations in implementing the resolution of the 20th PZPR Central Committee Plenum and the systematic development of the party were the topics of the province committee plenum held in Szczecin on 25 [Nov 85]./

Candidate Member of the Politburo and Secretary of the PZPR Central Committee Wlodzimierz Mokrzyszczak took part in the deliberations.

In Suwalki:

/(C) The directions of strengthening the province party organization were the subject of a plenary session of the Olsztyn Province PZPR Committee held on 25 [Nov 85]./

'Working Class Culture' Conference

Warsaw RZECZPOSPOLITA in Polish 26 Nov 85 p 2

[Unattributed report under 'Conferences' rubric: "Working Class Culture"]

[Text] /(C) As part of a series of conferences on the topic of working class culture in Poland, organized on the initiative and under the auspices of the Culture Department of the PZPR Central Committee, an all-Polish symposium on problems of the cultural activism of workers at the workplace and in the community was held on 25 [Nov 85] at the H. CEGIELSKI Metal Industry Works in Poznan/ [emphasized].

The opening of the conference was attended by: Member of the PZPR Central Committee Politburo Wladyslaw Kalkus and Director of the Culture Department under the PZPR Central Committee Professor Witold Nawrocki.

CC Plenum on Fair Academic Admissions

Warsaw TRYBUNA LUDU in Polish 26 Nov 85 p 3

[Article by Wieslaw Jasinski: "For an Equitable Access to Studies: Following the 16th PZPR Central Committee Plenum"; passages within slantlines published in boldface]

[Text] /One important topic of discussions prior to the plenary session of the PZPR Central Committee on national education is the question of assuring a genuine rather than formal-legal access to higher studies for worker and peasant youth./

Despite the guaranteed equal chances for applicants demonstrating appropriate predispositions regardless of class origin, /the share of worker and peasant youth in student enrollment does not meet the aspirations of these classes as well as of the political and state authorities./ Hence -- quite unanimously -- various attempts have been made to develop concepts of assistance for applicants who, through no fault of their own, show themselves to be relatively less prepared for entrance examinations.

Beginning with the current academic year, the principles of admission to higher studies are changed. Administratively applied credit-point social preferences are being systematically abandoned and replaced with more effective methods for equalizing the level of preparation for studies by applicants from worker and peasant families as well as from culturally and materially deprived milieux.

Variant proposals on this matter were presented following the 16th PZPR Central Committee Plenum for broad public consultation in 1984. At 700 work establishments these proposals were discussed. Some 15,000 written responses were received. Thus this was an extremely broad and representative consultation.

/A majority of the respondents demanded the abandonment of credit-point preferences and their replacement with forms of genuine assistance for applicants for higher studies. By this they meant a system of preparatory courses, the introduction of a "zero-credit" semester of an equalizing nature, the participation of university instructors in guided self-study organized by secondary schools and the creation of a longrange program for raising the level of instruction in elementary and secondary schools./

/This public consultation essentially afforded a chance for discussion of the status of national education. The respondents drew attention to the unjustified differentiation of the level of instruction and upbringing at schools of various types and in various regions, the low level of performance of a majority of rural schools, the inadequate quality of performance of many teachers, the huge shortages of school personnel and equipment and the weak and deteriorating school plant. Many party echelons drew attention to the need for work establishments to provide greater assistance to schools./

The course of this public consultation demonstrated that the traditional system of credit-point preferences based on class origin has not gained social approbation. At the same time the inequalities and excessive differentiation among particular schools and regions in training youth for higher studies are acutely felt. Thus in general the respondents, while stressing the role of the entrance examinations, favored the need to equalize the starting conditions rather than provide special privileges for some applicants.

Noteworthy is the position of the Main Council for Science and Education on this issue:

/"The Main Council recognizes fully the principle of a socially equitable conduct of recruitment construed as a positive selection of the cadre of the national intelligentsia. The Main Council believes that all inequalities existing at the moment of commencement of higher studies but not due to the fault of the applicant himself -- such as, e.g., a weaker level of preparation by the secondary school or a lower intellectual level of the applicant's family -- should be compensated through methods for complementing secondary education."/

The results of the aforementioned public consultation as well as the opinions of socialist youth unions, the Union of Polish Teachers and many party echelons at all levels all point to the need to draft a longrange program assuring a stable influx of youth from worker and peasant families to higher schools, as well as to the need for a detailed analysis of the sources and consequences of the social composition of students.

On considering the results of the public consultation, the educational authorities and the ministries supervising higher schools were placed under the obligation of drafting a longrange program of action intended to increase the enrollment of students of worker and peasant origin. This program is to be published in the press during the last quarter of this year.

/Attempts have been undertaken to elevate the level of instruction in elementary and secondary schools, particularly those in small towns and rural communities. A set of measures to improve the system of extracurricular activities for senior-class students in these schools has been worked out. Attempts -- not yet fully successful -- have been commenced to identify the most gifted youth in secondary schools and provide proper educational and instructional care for it. Access to higher studies has been facilitated by organizing state-financed preparatory courses for students preferred owing to social considerations who are competent, derive from poor families and are active in youth organizations. A concept of a special type of courses is being developed for exceptionally gifted workers and peasants with a basic vocational schooling background who would thus be enabled -- through the acquisition of externist certificates of completion of secondary education-- to prepare themselves for starting higher studies./

All these measures have resulted in enhancing the interest of worker and peasant youth in higher studies. Of the more than 110,000 applicants who took entrance examinations this year, worker and peasant youth accounted for 38.5 percent compared with 33.8 percent last year. What is more important, however, worker and peasant youth accounted for 42.1 percent of the applicants who passed the entrance examinations. This demonstrates that this year it was better prepared for taking the entrance examinations for higher studies.

/An important role was played by the preparatory courses organized by higher educational institutions since June 1983. This year the school boards assigned to these courses altogether 18,500 candidates and on the average 70 to 80 percent actually attended. Of these, youth of worker and peasant origin accounted for about 85 percent. A considerable part of that youth was enabled by these preparatory courses to pass the entrance examinations and begin higher studies. Many party echelons are emphasizing a careful preparation of lessons, good organizational conditions and the interest and discipline of youth./

/But many desiderata for improving the organization of these courses also are being voiced. The need for a definite improvement in the procedure for the qualification of applicants by the school boards is being pointed out, primarily as regards commencing the qualification of candidates several months in advance. It is also necessary to provide secondary schools with regular information on areas and principles of study. Such information reaches the applicants too tardily./

The system of preparatory courses has passed the test and should be refined so that it may perform its purpose better and better. These courses should also assist the applicants to adapt themselves to working and living conditions in institutions of higher education and prepare them for active participation in the socio-political life of the student body.

The preparatory courses represent a major contribution of the academic community to refining the system of recruitment for higher studies, so that the examination sieve-screen would not overlook "diamonds."

The implementation of the first stage of modifying the system of recruitment for higher studies, based on a gradual abandonment of credit-point preferences, has not resulted in a decrease in the number of applicants but on the contrary it increased interest in higher education. For the first time, credit-point preferences were abandoned with respect to a majority of the engineering, economic and exact-science areas of study. This year the number of these areas will be increased. In the areas of study for which there is a substantial surplus of applicants the competitive principle will be maintained, meaning that those achieving the best scores on the entrance examination will be admitted.

/Thus, the adoption of the recommendations of the 16th PZPR Central Committee Plenum on this issue has already led to a number of positive changes in the system of admissions to higher studies as well as in the performance of the educational system, but this still does not mean that all the problems of an equitable access to higher educational institutions have been solved.

Cadre Policy Commission Hosts Conference

Warsaw RZECZPOSPOLITA in Polish 27 Nov 85 p 2

[Unattributed report under 'Chronicle' rubric: "Improving the Performance of the Managerial Cadre"]

[Text] /On 26 [Nov 85] in Jachranka near Warsaw was inaugurated a 2-day methodological conference on plant systems of work with the managerial cadre, sponsored by the Cadre Policy Department under the PZPR Central Committee, the Ministry of Metallurgy and Machine Industry and the Ministry of Chemical and Light Industry/ [emphasized].

At the session the PZPR side was represented by: Wojciech Jaruzelski, Kazimierz Barcikowski, Jozef Czyrek, Zbigniew Messner, Tadeuwz Porebski and Wlodzimierz Mokrzyszczak.

Joint Session of the Central Cooperation Commission and the Presidium of the Executive Committee of the PRON National Council:

11 November

-- A joint session of the Central Commission for PZPR-ZSL-SD Cooperation and the Presidium of the PRON National Council was held. The agreements reached by the Central Commission for Cooperation with respect to the second meeting of the Sejm were presented and discussed. The Presidium of the Executive Committee of the PRON National Council accorded its support.

Session of the Politburo of the Central Committee:

19 November

The Politburo:

-- discussed the implementation of the conservation program during the years 1983-1985 and the basic tasks in this field until 1990;

-- examined the implementation of the resolutions of the Ninth Central Committee Plenum concerning work education and the stimulation of economic initiative and production activism among youth and considered a report on consultation about the assumptions of the draft decree for broadening the participation of youth in the country's sociopolitical, economic and cultural life;

-- evaluated positively the draft decree for the plant social services fund and the plant housing fund.

Conferences and Meetings:

11 November

-- The Commission for Recommendations, Complaints and Signals from the Population under the Central Committee discussed the implementation of tasks ensuing from the Central Committee and province committee resolutions concerning the handling of problems of citizens by party echelons and organizations in the Lublin, Tarnobrzeg, Szczecin and Wroclaw provinces. The deliberations were chaired by Politburo Member Albin Siwak.

-- The Commission for Social Policies under the Central Committee discussed aspects of CPR '86 [1986 Central Annual Plan] relating to prices, employment, wages and living conditions. The deliberations were chaired by Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk.

The Agriculture Commission under the Central Committee examined the current situation of agriculture with allowance for the 1986 Central Annual Plan and evaluated the the status and implementation of land-reclamation and rural water supply investment projects as well as the premises of new legal and organizational solutions concerning land management. The deliberations were chaired by Central Committee Secretary Zbigniew Michalek and attended by Director of the Central Committee's Agriculture Department Stefan Zawodzinski.

-- The Commission for Law and Order under the Central Committee evaluated the sociopolitical situation of the lawyer community and the directions of action to improve it. The deliberations were chaired by the commission's vice chairperson Lucjan Czubinski.

-- The Commission for Science and Education under the Central Committee considered reports on the course of elections to the Sejm in the educational and university community, the status of the work on the implementing regulations for the revised decree on higher education, the development of the movement for Active National Assistance to Schools and the status of the party in higher schools. The deliberations were chaired by the commission's vice chairperson Tadeusz Chmielniak.

-- The Working Team for Historical Education held a session under the chairmanship of Candidate Member of the Politburo Professor Marian Orzechowski. Matters relating to the training and advanced training of teachers were discussed. Director of the Department of Science and Education under the Central committee Bronislaw Ratus took part in the deliberations.

12 November

-- The Ideology Commission under the Central Committee discussed the sociopolitical situation following the elections to the Sejm and the ensuing tasks for the ideological front and considered the assumptions of the system of party schooling. The deliberations were chaired by Politburo Member and Central Committee Secretary Jozef Czyrek.

13 November

-- A session of the collegium and executive board of the basic party organization at TRYBUNA LUDU was held with the participation of Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk. J. Glowczyk formally appointed Jerzy Majka the editor-in-chief of TRYBUNA LUDU. Director of the Press, Radio and Television Department under the Central Committee Bogdan Jachacz took part in the session.

14 November

-- The Warsaw PZPR Committee, deliberating in the presence of First Central Committee Secretary Wojciech Jaruzelski, relieved Marian Wozniak from the post of first secretary of this committee in connection with his appointment to the post of Central Committee secretary. Janusz Kubasiewicz was elected the new first secretary of the Warsaw PZPR Committee. J. Kubasiewicz was previously director of the Socio-Legal Department under the Central Committee. Those taking part in the session included: Politburo Member Albin Siwak, Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak and Director of the Cadre Policy Department Wladyslaw Honkisz.

-- In Warsaw was held a conference of first secretaries of party committees in military districts, the armed services and military academies. The directions and tasks of party work in the army ensuing from the preparations for the 10th PZPR Congress were discussed. The Chief of the GZP WP [Main Political Directorate of the Polish Army] and Deputy Minister of National Defense General of Arms Jozef Baryla took part in the conference.

15 November

-- Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk met with Soviet journalists accredited to Poland. Problems of cooperation between Polish and Soviet mass media during the period of preparations for the 27th CPSU Congress and the 10th PZPR Congress were discussed. The meeting was attended by Director of the Press, Radio and Television Department under the Central Committee Bogdan Jachacz.

15-16 November

-- In Warsaw was held a conference of secretaries of higher-school PZPR committees at which the tasks of party organizations in the university student community were discussed. The conference was chaired by Director of the Department for Science and Education under the Central Committee Bronislaw Ratus and attended by Director of the Department for Youth under the Central Committee Leszek Miller.

18 November

-- In Warsaw was held a conference of the province party committee secretaries responsible for cultural matters. It was chaired by Central Committee secretary Waldemar Swirgon.

21 November

-- In Prague was held a meeting of the leaders of the member countries of the Warsaw Treaty. The Polish side was represented by First Central Committee Secretary and Chairman of the Council of State Wojciech Jaruzelski. Minister of Foreign Affairs Marian Orzechowski also was present. At the meeting Secretary General of the CPSU Central Committee Mikhail Gorbachev briefed the participants on the course and results of the recent Soviet-American summit meeting in Geneva.

-- Politburo Member and Central Committee Secretary Jozef Czyrek received a delegation of the Federal Conference of the Socialist Union of the Working People of Yugoslavia during its sojourn in Poland, headed by Presidium Chairman Professor Aleksandr Grliczkov.

22 November

-- In Warsaw was held a conference on ideology and theory for the high command of the PRL armed forces. The speakers at the conference included the candidate members of the Politburo Central Committee Secretary Wlodzimierz Mokrzyszczak and Minister of Foreign Affairs Marian Orzechowski as well as Central Committee Secretary Waldemar Swirgon. Candidate Member of the Politburo and Minister of National Defense Army General Florian Siwicki took part in the conference.

23 November

-- The 17th Plenum of the CKKP [Central Party Control Commission] was held with the participation of chairpersons of the province party control commissions. The implementation of the tasks adopted for the second half of this year, a draft plan of action for the subsequent months and the work on the CKKP's report to the 10th Party Congress were discussed. The deliberations were chaired by CKKP Chairman Jerzy Urbanski.

At Party Echelons and Organizations

15 November

-- The Radom Province PZPR Committee discussed the intelligentsia's role in developing the region with allowance for the implementation of the resolution of the 19th Central Committee Plenum. The participants in the deliberations included Politburo Member Zofia Grzyb and Central Committee department directors Wladyslaw Loranc and Witold Nawrocki.

-- The Bialystok Province PZPR Committee evaluated the implementation of the resolution of the joint Ninth Plenum of the PZPR Central Committee and the ZSL Supreme Committee and outlined the main tasks for Bialystok agriculture. Central Committee Secretary Zbigniew Michalek took part in the deliberations.

16 November

-- Central Committee Secretary Waldemar Swirgon met at the PERKOZ School of Senior Scouts near Olsztynek with young councilmen and deputies recommended by the ZHP [Polish Scouts Union].

18 November

-- The Sieradz Province PZPR Committee discussed the tasks of the province party organization and basic-level echelons in strengthening the role of party members in their communities.

20 November

-- The Wroclaw Province PZPR Committee assessed the campaign of elections to the Sejm in the province and, in this context, outlined the directions of action in strengthening socialist democracy, the leading role of the party and stabilization of sociopolitical life in the province.

-- Politburo Member Zofia Grzyb met with the party-managerial aktiv of JARLAN Knitwear Industry Works in Jaroslaw.

-- The Wloclawek Province PZPR Committee considered the problems of housing construction in the context of the 1986-1990 development plan for the region.

23 November

-- In Katowice were held funeral ceremonies for General Jerzy Zietek, Builder of People's Poland. They also were attended by the following representatives of the supreme authorities and members of the Politburo: Prime Minister Zbigniew Messner, Vice Chairman of the Council of State Kazimierz Barcikowski, and miner Jerzy Romanik, and also Candidate Member of the Politburo Central Committee Secretary Jan Glowczyk.

Interparty Cooperation

4-12 November

-- A delegation of the Central Committee of the Labor Party of Korea headed by Central Committee Member and Director of the Economic Department Kong Sun Chi sojourned in Poland. The guests were received by Central Committee Secretary Henryk Bednarski. Director of the Economic Department under the Central Committee Marek Holdakowski took part in the conversation.

14 November

-- Secretary General of the Central Committee of the Czechoslovak CP Gustav Husak received PZPR Central Committee Secretary Henryk Bednarski during his working visit to Czechoslovakia. In the course of the conversation, cooperation between the PZPR and the Czechoslovak CP in the field of ideology was evaluated. Candidate Member of the Presidium and Secretary of the Central Committee of the Czechoslovak CP Jan Fojtik and Secretary of the Central Committee of the Czechoslovak CP Josef Havlin took part in the conversation.

11-15 November

-- A working delegation of the Central Committee of the Bulgarian CP headed by First Deputy Director of the Department of Ideological Policy under the Central Committee V. Momov sojourned in Poland. Toward the end of its sojourn the delegation was received by Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk. Director of the Ideology Department under the PZPR Central Committee Wladyslaw Loranc took part in the meeting.

22 November

-- A one-day working visit to Bucharest was paid by First Secretary of the PZPR Central Committee and Chairman of the PRL Council of State Wojciech Jaruzelski. He was accompanied by Politburo Member and Central Committee Secretary Jozef Czyrek and Deputy Prime Minister and Chairman of the Planning Commission Manfred Gorywoda.

-- A study delegation of the Agriculture Department under the Central Committee of the Mongolian People's Revolutionary Party, headed by department director Gendegijn Bizjan ended its visit of several days to Poland. The delegation was received by Candidate Member of the Politburo and Central Committee Secretary Wlodzimierz Mokrzyszczak.

Party Activities Calendar 25 Nov - 8 Dec 85

Warsaw ZYCIE PARTII in Polish 18 Dec 85 p 21

[Unattributed report: "Party Chronicle: 25 November--8 December 1985"]

[Text] Politburo Sessions:

26 November

The Politburo:

-- studied a report on the meeting of the leaders of the socialist countries in Prague subsequent to the talks between Secretary General of the CPSU Central Committee Mikhail Gorbachev and the President of the United States;

-- discussed next year's central plan and the anticipated conditions of its fulfillment;

-- considered a forecast for meeting the food needs of the society in the coming year as well as the status of land reclamation and rural water supply;
-- listened to a report on Wojciech Jaruzelski's visit to Romania.

Second All-Polish Party Conference on Ideology and Theory:

28 November

-- The 2-day Second All-Polish Party Conference on Ideology and Theory, devoted to discussing the draft PZPR Program, was ended. The participants in the deliberations included, in addition to 500 invited party activists, members of the Politburo and Secretariat of the Central Committee. During the deliberations, which were chaired by Politburo Member and Central Committee Secretary Jozef Czyrek, reports were presented by Candidate Member of the Politburo Marian Orzechowski and Central Committee Secretary Henryk Bednarski. On the first day of the conference an address was delivered by First Central Committee Secretary Wojciech Jaruzelski. Next, the conference participants deliberated in eight topic sections. On the second day of the conference, reports on the activities of the topic sections were presented and a plenary discussion took place.

Conferences and Meetings:

25 November

-- The Culture Commission under the Central Committee discussed the currrent status and development prospects of stage entertainment in Poland. The deliberations were chaired by Central Committee Secretary Waldemar Swirgon.

26 November

-- First Central Committee Secretary Wojciech Jaruzelski met with Chairman of the PTNP Polish Society of Political Sciences] Professor Czeslaw Mojsiewicz and members of the Society in connection with the 25th anniversary and Seventh Congress of the PTNP. Politburo Member and Central Committee Secretary Tadeusz Porebski took part in the meeting.

27 November

-- First Central Committee Secretary Wojciech Jaruzelski, in the presence of Politburo Member and Central Committee Secretary Marian Wozniak, received Harry Tisch, a member of the Politburo of the SEPD Central Committee and chairman of the Central Board of the FDGB [Association of Free German Trade Unions], during his visit to Poland as head of the FDGB delegation invited by the OPZZ [National Federation of Trade Unions].

28 November

-- First Central Committee Secretary and Chairman of the Council of State Wojciech Jaruzelski arrived in Katowice Province in connection with the coming Day of the Miner. W. Jaruzelski and the Politburo members and Central Committee secretaries Marian Wozniak and Jerzy Romanik toured the construction site of the miners' hospital in Sosnowiec and visited miners at the GENERAL ZAWADZKI Mine. At a meeting with mine-crew representatives W. Jaruzelski decorated the mine's flag with the Grand Cross of Poland's Rebirth. A group of leading miners received from W. Jaruzelski's hands high state decorations.

-- The Commission for the Protection of Public Health and Natural Environment under the Central Committee completed its 2-day deliberations at a circuit session in Katowice dealing with restoration of the ecological equilibrium and reduction of industrial pollution. The deliberations were chaired by Politburo Member Stanislaw Opalko.

-- A 2-day all-Polish methodological conference on "Plant Systems of Working With Technician Personnel," organized in Jachranka near Warsaw by the Cadre Policy Department under the Central Committee and the Ministery of Metallurgy and Machine Industry as well as the Ministry of Chemical and Light Industry, came to an end. Its deliberations were summed up by Director of the Cadre Policy Department under the Central Committee Wladyslaw Honkisz.

29 November

-- Assessment of Sejm elections and the ensuing conclusions regarding party work prior to the 10th Congress were the topics of a meeting between Central Committee lecturers and Politburo Member and Central Committee Secretary Tadeusz Porebski.

29-30 November

-- A conference of the economic secretaries of province party committees was held in Poznan. Problems of housing construction, a more efficient consumption of raw and other materials and energy and the 1986 Central Annual Plan were the topics of discussion. The deliberations were chaired by Politburo Member and Central Committee Secretary Marian Wozniak, and participated in by Politburo Member Stanislaw Kalkus.

30 November

-- At the seat of the Central Committee was held a conference of directors of interprovince and province party schools. The tasks of the schools for the first half of 1986 were discussed. Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak took part in the conference.

3 December

-- On the eve of the traditional "Day of the Miner" a ceremonial meeting was held at the House of Music and Dance in Zabrze. It was attended by,in addition to the leading miners and heads of the province, the following representatives of the highest party and state authorities: Zbigniew Messner, Roman Malinowski, Tadeusz Witold Mlynczak, Kazimierz Barcikowski, Stanislaw Kalkus, Jerzy Romanik, Albin Siwak, Marian Wozniak, Czeslaw Kiszczak, Manfred Gorywoda, Jozef Koziol and Zbigniew Szalajda.

4 December

-- At the PZPR Central Committee was held a national conference of province party committee secretaries and editors-in-chief of press, radio and television agencies. The participation of the mass media in the campaign for elections to the Sejm and the conclusions ensuing from this campaign for propaganda work were discussed. The discussion was opened with a speech by Director of the Press, Radio and Television Department under the Central Committee Bogdan Jachacz, and summed up by Candidate member of the Politburo and Secretary of the Central Committee Jan Glowczyk.

5 December

-- The Central Committee's Commission on Women discussed the operation of the "Practical Woman" and "Modern Homemaker" centers. A report on the participation of the Polish delegation in the International Women's Conference in Nairobi and on the female deputies to the Ninth Session of the Sejm was also presented. The deliberations wree chaired by Politburo Member Zofia Grzyb.

6 December

-- First Central Committee Secretary and Chairman of the Council of State Wojciech Jaruzelski granted an interview to the West German weekly STERN. The text of the interview was published in TRYBUNA LUDU of 6 December 1985.

-- On the invitation of First Central Committee Secretary Wojciech Jaruzelski a visit of several days was paid to Warsaw by the Chairman of the SPD [Socialdemocratic Party of Germany] Willy Brandt. The next day, the PZPR and SPD delegations held talks chaired by Wojciech Jaruzelski and Willy Brandt.

-- On the occasion of the 50th anniversary of the satirical weekly SZPILKI an exhibition of satirical drawings was opened in the capital city's Museum of Carricature by Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk.

7 December

-- Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk met with the editorial team of ZYCIE GOSPODARCZE in connection with the weekly's 40th jubilee anniversary. Some 15 of the team's members received state decorations.

At Party Echelons and Organizations

25 November

-- The Szczecin Province PZPR Committee discussed the tasks of party members and organizations in implementing the resolution of the 20th Central Committee Plenum. Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak took part in the deliberations.

-- The Suwalki Province PZPR Committee discussed the development of the agricultural and food industry in the province until 1990.

-- The Olsztyn Province PZPR Committee outlined the directions of strengthening the province party organization.

-- Politburo Member Albin Siwak participated in an open party meeting at the Warsaw ENERGOBUD Power Construction Plant, dealing with the conditions for the activism of the rising generation.

28 November

-- The Lodz Province PZPR Committee evaluated the implementation of socio-economic tasks and discussed the tasks ensuing from the assumptions of the 1988-1990 National Socioeconomic Plan for the Lodz Province.

-- The Biala Podlaska Province PZPR Committee discussed ways of improving the system of national education at educational and upbringing institutions.

-- The Leszno Province PZPR Committee evaluated the implementation of the province socioeconomic plan in the years 1983-1985 and outlined tasks of party work for the years 1986-1990.

-- The Zamosc Province PZPR Committee deliberated improvements in rural and agricultural services.

29 November

-- The Elblag Province PZPR Committee, at a joint session with the ZSL Supreme Committee, discussed the principal problems of the province's agriculture. The participants in the session included: PZPR Central Committee Secretary Zbigniew Michalek and ZSL Supreme Committee Secretary Kazimierz Olesiak.

-- The Ciechanow Province PZPR Committee formulated recommendations and tasks for party echelons and organizations ensuing from the campaign for elections to the Sejm. The plenary session also considered reports on the implementation of resolutions of the plenums of the Central Committee and the province committee concerning suggestions and complaints submitted to party echelons and organizations.

-- The Kalisz Province PZPR Committee evaluated the implementation of the resolution of the 13th Central Committee Plenum concerning the main assumptions of PZPR cadre policy.

-- The Krakow PZPR Committee discussed the main directions of the work of party organizations in the academic and cultural communities.

-- The Tarnow Province PZPR Committee discussed problems of law and order on the province's territory.

2 December

-- The Katowice Province PZPR Committee discussed the living conditions of the province's population and the results of the social policies pursued by work establishments. Politburo Member Jerzy Romanik participated in the deliberations.

-- In connection with the 65th birthday of merited party and state activist Jerzy Muszynski, the PZPR CKR Chairman Kazimierz Morawski met with the jubilee celebrant at the seat of the PZPR Central Committee and conveyed to him best wishes and expressions of acknowledgment.

5 December

-- The Czestochowa Province PZPR Committee evaluated the implementation of the resolutions adopted at its plenary sessions in the last 3 years with respect to ideological-upbringing activities. The committee accepted the resignation of Wladyslaw Jonkisz from the post of first committee secretary in connection with his being entrusted by the Sejm the duties of a member of the Council of State. The committee elected a new first secretary, Jerzy Sypek, previously a secretary of this echelon. Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak participated in the deliberations.

-- The Bielsko Biala Province PZPR and ZSL committtees evaluated at a joint session the implementation of tasks in agriculture. Central Committee Secretary Zbigniew Michalek, Director of the Department of Intraparty Management under the Central Committee Antoni Gorny and Chairman of the Agriculture Commission under the ZSL Supreme Committee Professor Waldemar Michna participated in the deliberations.

-- The Ostroleka Province PZPR and ZSL committees evaluated the implementation of the resolution of the 11th Plenum of the PZPR Central Committee and the ZSL Supreme Committee, with special consideration of the social conditions in the countryside. Director of the Agriculture Department under the Central Committee Stefan Zawodzinski and Deputy Director of the Economy and Agriculture Department under the ZSL Supreme Committee Stanislaw Pohorylo participated in the deliberations.

-- The Piotrkow Trybunalski Province PZPR Committee discussed the principal problems of cultural development in the province until 1990. Candidate Member of the Politburo and Secretary of the Central Committee Jan Glowczyk participated in the deliberations.

-- The Torun Province PZPR Committee considered problems of shaping socialist awareness as part of the cultural education of the province's population.

6 December

-- The Skierniewice Province PZPR and ZSL committees evaluated at a joint session the implementation so far of tasks ensuing from the resolution of the 11th Plenum of the PZPR Central Committee and the ZSL Supreme Committee. Member of the Presidium and Secretary of the ZSL Supreme Committee Kazimierz Olesiak and Deputy Director of the Agriculture Department under the PZPR Central Committee Ludwik Stasinski took part in the deliberations.

-- The Slupsk Province PZPR Committee evaluated the implementation of the 3-Year (1983-1985) Socioeconomic Plan in the province. Politburo Member and Central Committee Secretary Marian Wozniak took part in the deliberations.

-- The Tarnobrzeg Province PZPR and ZSL committees evaluated, at a joint circuit session in Sichow, the implementation in the province of the resolution of the 11th Plenum of the PZPR Central Committee and the ZSL Supreme Committee. PZPR Central Committee Secretary Zbigniew Michalek and Vice President of the Party Court under the ZSL Supreme Committee Stanislaw Zielinski took part in the deliberations.

-- The Warsaw PZPR Committee discussed the directions of further work on the internal strengthening of the Warsaw party organization. Politburo Member Albin Siwak and Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak took part in the deliberations.

7 December

-- In Wloclawek was held a conference of 1,300 secretaries of basic party organizations and the aktiv of the province. The performance of basic party organizations was evaluated and the main directions of the political campaign prior to the 10th Party Congress were determined. Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak and Deputy Director of the Political-Organizational Department under the Central Committee Jan Bluszkowski took part in the deliberations.

Interparty Cooperation:

25-29 November

-- A delegation of the HSWP [Hungarian Socialist Worker Party] headed by Central Committee Member and Secretary of the Samogy HSWP Central Committee Imre Klenovics visited Poland. The delegation held talks with the heads of the Political-Organizational Department under the PZPR Central Committee and familiarized itself with the work of party echelons and organizations in Gdansk and Bydgoszcz provinces. Toward the end of its visit the delegation was received by Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak in the presence of Director of the Political-Organization Department under the Central Committee Kazimierz Cypryniak.

26-30 November

-- A worker delegation headed by Deputy Director of the Agriculture Department under the SEPD Central Committee Heinz Drescher visited Poland. The delegation toured the Lomza, Bialystok and Suwalki provinces and held talks with Director of the Agriculture Department under the PZPR Central Committee Stefan Zawodzinski. The delegation was received by Central Committee Secretary Zbigniew Michalek.

-- Poland was visited by a delegation of the Central Committee of the Worker Party of Ethiopia, headed by Central Committee Secretary Wubeshet Dessie. During their visit to Radom Province, First Province Committee Secretary Bogdan Prus briefed the visitors about the socioeconomic problems and main directions of party work in the province. Politburo Member Zofia Grzyb took part in the meeting. Candidate Member of the Politburo and Secretary of the Central Committee Wlodzimierz Mokrzyszczak held talks with the delegation.

INCREASED SOVIET CONTACTS, COOPERATION

Warsaw TRYBUNA LUDU in Polish 13 Nov 85 p 7

Theatre Festival in Katowice

["Festival of Russian and Soviet Drama in Katowice" -- PAP report; passages within slantlines printed in boldface]

[Text] On 15 [Nov 85] in Katowice will begin the jubilee 10th Festival of Russian and Soviet Theatre, which will last until 24 November./

This quadrennial series of performances of the modern theatre and classical plays of the Land of the Soviets will be inaugurated this year by the Malyy Theatre of Moscow, which will stage Sergey Naydonov's "Vanyushin's Children" and Yuriy Bondarev's "The Choice" for audiences in Silesia, Poznan and Warsaw.

Concerning the visit of Malyy Teatr to Poland, it is worth noting that several weeks ago the Stanislaw Wyspianski Silesian Theatre of Katowice had given performances in Moscow. /The USSR Ministry of Culture sent the management and troupe of the Silesian theatre a letter of thanks for its successful performances along with best wishes for further successes in artistic activity, in propagating Russian and Soviet drama and in developing and strengthening cultural cooperation between Poland and the Soviet Union/ [emphasized]. Malyy Teatr will give performances in Katowice (15-16 [Nov 85]), Poznan (18-19 [Nov 85]) and Warsaw (21-25 [Nov 85]).

Soviet Mass Media Cooperation

Warsaw TRYBUNA LUDU in Polish 16-17 Nov 85

[Unattributed report under 'Chronicle' rubric: "Cooperation Between Polish and Soviet Mass Media"]

[Text] On 15 [Nov 85] Candidate Member of the Politburo and Secretary of the PZPR Central Committee Jan Glowczyk met with Soviet journalists accredited in Poland. Aspects of cooperation between Polish and Soviet mass media during the period of preparations for the 27th CPSU Congress and the 10th PZPR Congress were discussed.

The meeting was attended by Director of the Press, Radio and Television Department under the PZPR Central Committee Bogdan Jachacz. USSR Embassy Councilor Mikhail Krapivin was present.

'Moscow-85' Festival Conclusion

Warsaw TRYBUNA LUDU in Polish 16-17 Nov 85

[Untitled report under the rubric "The Polish Press Agency Informs"]

[Text] The final session of the Polish "Moscow-85" Festival Committee was held on 15 [Nov 85] in Warsaw. The meeting was opened by Jerzy Szmajdzinski, vice chairperson of the PKF [Polish Festival Committee] and vice chairperson of the Main Board of the ZSMP [Union of Polish Socialist Youth], and PKF Secretary Andrzej Minko reported on the accomplishments and lessons of the festival. Thanks for help in preparing this meeting of the progressive youth of the world as well as for active participation therein were expressed by Nikolay Pal'tsev, director of the Agitation and Propaganda Department under the Central Committee of Lenin's Komsomol. Secretary General of the TPPR [Main Board of the Polish-Soviet Friendship Society] Stefan Nawrot described projects undertaken by elements of the TPPR.

Director of Youth Department under the PZPR Central Committee Leszek Miller participated in the deliberations.

In the evening the session participants gathered at a festive concert performed by Polish ensembles and a group of artists from the Land of the Soviets. The audience included Secretary of the PZPR Central Committee Waldemar Swirgon.

Soviet Farmers Delegation Visits

Warsaw TRYBUNA LUDU in Polish 20 Nov 85 p 2

[Unattributed report: "From the Sojourn of the Delegation of Soviet Farmers"]

[Text] On the invitation of the PZPR Central Committee a delegation of Soviet farmers,members of the CPSU, is touring Poland. It is headed by Twice Hero of Socialist Labor Vasiliy Chergantsev, a harvesting-combine driver at the Rassvet Kolkhoz in Orenburg Oblast.

Following talks held at the Agriculture Department under the PZPR Central Committee the Soviet guests traveled to Poznan, where they were received by the heads of the Poznan Province PZPR Committee. They were briefed on the problems of the region's socioeconomic development, with special consideration of matters relating to the development of agriculture and food management. In addition, there was an exchange of experience relating to party work within local agricultural organizations. The members of the delegation placed wreaths at the Monument to Heroes in the Park of Friendship and Brotherhood of Arms, Poznan Citadel.

Polish-Soviet Friendship Society

Warsaw TRYBUNA LUDU in Polish 21 Nov 85 p 5

[Untitled report under the rubric "PAP Informs"]

[Text] The accomplishments of the nation's largest plant branch of the TPPR at the Stalowa Wola Steel and Iron Plant were assessed on 20 [Nov 85] at a report-program conference; a portentous moment during the deliberations was the presentation of the 10,000th membership card by the plant TPPR organization to Halina Rzepa, a plant department employee. The conference was attended by PZPR Central Committee Secretary Henryk Bednarski, who congratulated the plant's TPPR activists on their significant accomplishments.

Soviet Chemists Union Delegation Visit

Warsaw TRYBUNA LUDU in Polish 21 Nov 85 p 5

[Article by (ges): "Soviet Unionists in Krakow"; passage within slantlines printed in boldface]

[Text] /(Own information) A delegation from the Central Committee of the Trade Union of Chemists in Moscow met in Krakow on 20 [Nov 85] with unionists from the STOMIL Rubber Industry Works./

The meeting generated substantive discussion of forms of cooperation among enterprises in the chemical subsectors of Poland and the Soviet Union. In particular, experience in rationalization of labor, social rights of workforces, application of new technologies and technical progress was exchanged. In addition, there was an exchange of information on projects for the next few years.

In the afternoon hours the Soviet guests placed flowers at the Monument Mausoleum of Soviet Army Personnel fallen in the battles for the liberation of Krakow as well as on the slab of the Tomb of the Unknown Soldier.

Veterans Awarded at Consulate

Warsaw RZECZPOSPOLITA in Polish 22 Nov 85 p 7

["World War II Veterans Decorated With Medals: At the USSR Consulate in Krakow" -- PAP report; passage within slantlines printed in boldface]

[Text] /(C) On 21 [Nov 85] at the USSR Consulate in Krakow 30 World War II veterans who had served in the Soviet Army were awarded medals honoring the 40th anniversary of the defeat of fascism, granted by the USSR Supreme Soviet. The medals were presented by the Consul General and Plenipotentiary Minister of the USSR in Krakow Georgiy Rudov./

The group of decorated veterans from, among other places, the provinces of Bielsk, Nowy Sad, Kielce, Krakow, Katowice and Zamosc, was honored with the following medals: for the defense of the Caucasus, Odessa, Sevastopol, Stalingrad, Kiev and Warsaw, and for the conquest of Berlin.

Cooperative Film Making Planned

Warsaw RZECZPOSPOLITA in Polish 22 Nov 85 p 7

["Plans for Film Coproduction Between Poland and the USSR" -- PAP report; passage within slantlines printed in boldface]

[Text] /(C) According to ZESPOLY FILMOWE Filming Enterprise a preliminary agreement for joint production of the diptich bearing the provisional title "We Shall Remain Faithful" has been signed in Moscow between Polish and USSR filmmaking groups./ Filmmaking enterprises from Czechoslovakia, the GDR and Hungary will also participate in producing the film. This work will depict the brotherhood of arm that was born in the fire of battle on fields of battle. [PAP report] [Warsaw RZECZPOSPOLITA in Polish 22 Nov 85 p 7] 2600

PZPR CC Delegation in Moscow

Warsaw TRYBUNA LUDU in Polish 23-24 Nov 85 p 7

[Unattributed report under the rubric "The PRL and the USSR: Strengthening of Cooperation"]

[Text] On the invitation of the CPSU Central Committee a delegation of the PZPR Central Committee headed by Central Committee Secretary Zbigniew Michalek made an official visit to the Soviet Union.

During its 5-day sojourn in the Land of the Soviets the delegation met with, among others, CPSU Central Committee Secretary Viktor Nikonov. Z. Michalek and V. Nikonov exchanged experience relating to party work as well as information on the current situation in the agriculture of both countries and on the tasks of agricultural ministries for the next 5-year period. In addition, they discussed problems relating to the further expansion and strengthening of Polish-Soviet cooperation in agriculture and food management as well as the question of mutual exchange of knowhow. Z. Michalek and V. Nikonov furthermore considered problems of the further development of trade in agricultural commodities between Poland and the USSR and exchanged information on the measures being taken in both countries to achieve self-sufficiency in food production.

OPZZ Delegation in Moscow

Warsaw TRYBUNA LUDU in Polish 23-24 Nov 85 p 7

[Unattributed report under the rubric "The PRL and the USSR: Strengthening of Cooperation"]

[Text] A working visit to Moscow was completed by a delegation of the OPZZ [National Confederation of Trade Unions] headed by the Chairman of the Commission for International Cooperation Jerzy Uzieblo.

The OPZZ delegation familiarized itself with the whole of the international activities of Soviet trade unions. At meetings with K. Matskiavichus and A. Subbotin, secretaries of the All-Union Central Council of Trade Unions, and in talks with the heads of the foreign department, the results and prospects so far of bilateral cooperation were discussed.

HEAD OF HIGHER MILITARY MEDICAL INSTITUTE INTERVIEWED

Sofia BULGÁRSKI VOIN in Bulgarian No 9, 1985 pp 14-15

[Interview granted by Mj Gen Prof Nikolay Kupenov, chief of the Higher Military Medical Institute, on the occasion of the 25th anniversary of its founding: "The VVMI [Higher Military Medical Institute]--A High Prestige Institute"]

[Text] [Question] Comrade General, what are the main aspects in the development of the VVMI which were the base for its current successes?

[Answer] Let me stress, above all, the great perspicacity of the BCP Central Committee, which was manifested in the decision to set up the VVMI and the accurate concept formulated by the MNO [Ministry of National Defense] regarding the nature of the institute as a one-of-a-kind establishment. The institute was to help resolve much more successfully problems of training military medical cadres, the need for which was growing with incredible speed, to enhance standards of treatment and diagnosis in the all-army hospital, to accelerate progress and to improve scientific research efficiency in the field of military medicine. The establishment of the VVMI made it possible to carry out these assignments on a comprehensive basis.

The second important feature was strengthening the ties between the VVMI and the S. M. Kirov Military Medical Academy in Leningrad, where a large number of our institute's military medical personnel were trained. They include the tremendous majority of our leading specialists, who apply Soviet experience in the field of medicine and military medicine in our institute.

The third important feature worth noting is the scientific devlopment of cadres as a result of a the establihment of the VVMI. Currently the institute employs a large number of professors, docents and senior scientific associates first and second class; a number of candidate and doctoral dissertations have been defended. The number of honored physicians and honored workers in sciences, laureates of the Dimitrov prize and others is impressive. Along with the development of cadres, the training-education, treatment and scientific activities of the institute have marked progress.

Finally, the new VVMI building is a basic feature. Progress in all of the institute's activities was accomplished also with the old facilities which, however, quite soon turned into a hindrance to further development. Thanks to the concern of the party and the direct guidance of the construction by Army General Dobri Dzhurov, BCP Central Committee Politburo member and minister of national defense, we now have an exceptionally rich and modern base which offers incomparably better conditions for the treatment of the patients and for the work of the personnel. It is a prerequisite for enhancing overall activities to a much higher level.

[Question] What are the most important treatment and prophylactic assignments to be carried out by the collective currently and how are they being resolved?

[Answer] The institute's collective faces important and responsible assignments in the area of diagnostic and treatment work. This includes, above all, the steady enhancement of the level of such activities and their efficiency. An increasing number of people suffering from most severe illnesses are coming to the institute for treatment after no other help has been available in a number of cases. This makes it incumbent upon us constantly to improve our diagnostic process, reduce diagnositc errors to a minimum and formulate and accurate course of treatment.

Secondly, we must master, perfect and apply the latest contemporary and highly effective treatment methods. In this respect, our aspiration is to compare ourselves not with what was yesterday and what is today in our country but what is taking place in the rest of the world. Our time demands the aspiration to reach global standards.

It is not easy for us to assess the implementation of this task by ourselves. We believe that some successes have been achieved in his respect. One objective criterion, for example, is the fact that in recent years our diagnosis has not been amended for even one patient sent abroad for consultation. Today the people abroad base their treatment entirely on our studies which are not rechecked. As a rule, any plan for treatment drawn up by Bulgarian physicians has not been subjected to substantial changes.

Another task is decisively to improve patient care. This is made incumbent upon us by the party decisions and the new building of the institute, which is providing us with excellent conditions. The decisive factor now in this respect is the subjective one.

We believe that positive changes have been made in this respect. The two-step care at the institute has already become a fact and is being applied with increasing success. In no case should we think, however, that we have done enough.

One of the main principles in health care in a socialist society is prevention. It is fully applied in our work. In recent years the institute has extensively applied on an increasingly higher level the outpatient treatment method. Outpatient treatment of higher ranking command personnel takes place in a clinical environment. The results indicate that this method is entirely justified. In many cases a disease is detected at its early stage, when it can still be treated successfully. Furthermore, we are detecting conditions at the stage directly preceding the development of a disease, when treatment is very easy. We intend to promote and improve this method.

Finally, the development of several new trends in treatment activities is one of our important tasks. Thus, for example, we shall undertake the even more extensive use of ultrasound diagnosis, expand laser treatment and development of endoscopy, not only for diagnostic purposes but for endoscopic therapy as well. We are encouraging the more extensive development of microsurgery, etc. All of these and other trends, naturally, become possible with the application of scientific and technical progress.

[Question] Could you say something about trends in the use of scientific and technical progress, computerization and utilization of the intellectual potential in VVMI activities?

[Answer] With its new facilities, the VVMI operates on a high scientific and technical level. It is equipped with modern diagnostic and treatment instruments, thanks to which we were able to achieve the type of progress in our diagnostic treatment work we mentioned. The new equipment has been mastered and is being used very successfully, for several highly skilled specialists were trained to work with it. We have set up a full-day schedule for its maximum utilization. The number of tests is growing steadily, which indicates its increased utilization. Let us point out that thanks to the organization of preventive technical control and technical servicing, our equipment rarely breaks down. We are helping other medical institutions whose equipment is temporarily out of order. This occurs most frequently in the use of computer tomography and some other instruments.

We are not satisfied with what we have and we keep trying to improve our technical facilities. We are planning the aquisition of new equipment for the new areas I mentioned.

Our center for scientific military medical information is offering increasing possibilities of upgrading the knowledge of specialists. We are planning its total modernization in the near future through the use of computers which will be connected with the Central Institute for Scientific and Technical Information and with some centers for scientific medical information in the USSR, Czechoslovakia and elsewhere. This will exceptionally improve such activities. We have a long-term plan for upgrading the skills of medical cadres, junior personnel in particular, on the basis of the new requirements. This plan was formualated several years ago and we are currently updating it.

We also pay great attention to the study of Russian and Western languages.

We are currently instructing teachers and scientists in the use of personal computers. This equipment will be subsequently used in student training.

[Question] Comrade General, how do you see the further development of the VVMI?

[Answer] In an ascending line. The available modern technical diagnostic and treatment facilities and the availability of young trained and promising cadres who provide continuity, and the enthusiasm with which most of the personnel work lead me to believe that the prestige of the institute will continue to grow. Demand for treatment at the institute will increase and, at the same time, the need for consultation and treatment abroad in some severe cases will decline. The organization and system of training health cadres for the needs of the Bulgarian armed forces will improve; an increasingly broader range of scientific military medical problems related to medical support of the troops will be resolved with increasing success. In other words, the contribution of the VVMI to strengthening the health of the soldiers will increase steadily, thus increasing our contribution to upgrading the combat capability and readiness of the Bulgarian people's army.

During the days marking the 25th anniversary of the VVMI we are reviewing our accomplishments and earmarking means of further and even faster development upward and forward.

Major General Professor Nikolay Kupenov

SOCIOLOGY BULGARIA

DISAPPOINTING CENSUS RESULTS, ERODING STATE OF FAMILY ANALYZED

Where is the One and Only Woman?

Sofia TRUD in Bulgarian 14 Jan 86 p 3

[Article by Tosho Toshev]

[Text] It is true that women are plentiful: one-half of humankind. But where is that one woman? My wife, the one who will love only me, who will give birth to my children and raise them. Who will work as a respected partner among her colleagues although each one of them, even the best, will be merely way below my own manhood in her eyes.

Where is this only woman who will be tender and dear? She will be beautiful and attractive and will be looked over by all men but she will enjoy them only through me because of the pleasant ticklish feeling that it is precisely she, who is the most liked, is also the least accessible, for she will have no place in her heart and bed for anyone but me.

Where is the one who will accept all my male whims with understanding, calm them down in the embrace of her total dedication and gently threaten them with her shaking finger just enough to keep in me the conviction that I interest her everywhere and in everything and that she lives for me and through me?

According to some, this one and only woman no longer exists. She has melted, she has become part of the crowd. Others claim that although she may exist men, ah, those men! have become so unmasculine that they are totally unable to awaken her desire for one of them to be the only one. Yet, there precisely is the magic.

The reason is that truly no single woman could become the only one unless the man who stands by her is also the only one.

It turns out that the family, love, attachment and loyalty of the wife to the husband and the husband to his wife do not depreciate in value their decisive importance to the spiritual world of man. Physicians, sociologists, educators, publicists, writers and politicians deal with problems of family and love. They are almost unanimously worried because not everything is calm and safe in this most intimate human corner. Some even make dark predictions in which they find no place for the family, at least in its present aspect. Although these may be extremes, alarming facts already exist.

Is it a fact that divorces are irrepressibly increasing?

It is! Absolutely no administrative or moral codes could bind in reinforced concrete the family cell and force it to follow some kind of codified direction, the more so since quite frequently divorce offers the most moral solution.

Is it a fact that an increasingly fewer number of children are being born in today's Bulgaria?

It is a fact! The consequence of this fact is the rather realistic fear that our numbers are declining.

Is it a fact that the oldest and most reliable pillar of the family--marital faithfulness--became despairingly and hopelessly decayed all of a sudden, within one or two generations? It has become decayed and if it has not collapsed entirely, it continues to exist almost as window dressing. The most terrible thing is that marital unfaithfulness is swelling so unexpectedly rapidly that it is already becoming quite difficult to contain it within the discrete limits of the nonmarital bed. Unfortunately it is beginning to come closer to and reach the limits of spiritual betrayal, which cannot be concealed with any false fig leaves or memories of tenderness.

According to researchers, the reasons for all of this and for many other features of today's family are most different, complex and conflicting. Some of them are natural. According to some sex experts, one of the reasons is the "increased erotic enterprise and aggressiveness of women." Such aggressiveness, according to others, is explained by the growing significance of urban stress which, most generally speaking, has shaken loose some biological mechanisms ossified throughout the centuries in women and have armed the woman's body with the type of mischievous hormones which were so far typical of men only. At the same, that same urban stress has lowered precisely the generating of the same type of hormones in men. Naturally, this hypothesis is not shared by all. However, is it a fact that our women of today, not to speak of our daughters, who will be the women of the next generation of men, look very little like our mothers? It is a fact! And although this fact has a number of new pleasant features (level of information, intelligence, emancipation, etc.), does it also not include quite a number of scars which stand out like pock marks on the face of today's family?

It is also a positive fact that finally, women have found their place in society. They work alongside men. This is particularly important, for in the past women also worked but usually only in some kind of jobs for women which men were unwilling to do. Today the modern woman is everywhere where there are men. We even speak of a certain feminization of intellectual sectors in social practice, such as health care, education, some scientific areas, journalism, etc. Ignoring extremes for a moment, we could even claim that from the viewpoint of women and society as a whole, all of this is positive.

It has turned out, however, in our view, that that which is good for women in general and for society as a whole is not always good for the family as well.

Why?

Because after women came out of the family, some strange changes began to take place in what we consider the main cell of society. All of a sudden, the raising and education of children became terribly more difficult. The warmth and coziness of the family hearth began to decline catastrophically. Points of conflict between husband and wife in resolving even most petty daily problems increased at a fantastic speed. Who will take care of dirty dishes and unwashed laundry? Who will iron the man's shirts? Who will make breakfast, for the child at least? (less frequently, for the children?) Who?

Can you remember when was the last time on a weekday that the family sat down at the breakfast table for warm pancakes and a glass of fresh warm milk? There is no time for all this. The wife has no time. That is why the neighborhood coffee shop, the laundromat, are increasingly becoming our common "wife." As to the upbringing of the children, it takes place at the cradle in the children's home....

And if it were only this...

What is worse is that, having realized herself, personally and professionally, and whatever else, through her job, no one can now stop the woman and help her to realize herself emotionally as well. The job and the colleagues in the job replace, quite successfully at that and, in a certain sense, even more pleasantly and with greater variety, the husband!

This is accomplished in a naturally logical manner. The colleague (regardless of whether his hierarchical status is equal or higher) is the one with whom the wife discusses her present and future in specific terms and with understanding and, if necessary, with sympathy. It is with his help that quite frequently she can attain both immediate and more distant goals. And if the woman is ambitious, this becomes particularly important. It is with this same colleague that she experiences joys and pleasures. And, quite frequently, concerns and not only job-related ones. With increasingly frequency personal concerns and, not infrequently, concerns for family problems or husband are included. With him, with her colleague, the woman shares secrets, secrets which she does not share, she does not have to share with her husband. It is her colleague that she most frequently admires, whether for successes in the work, creativity, wit, charm, courage, or gallantry....

The husband is for the evening.

An evening which is so short: cleaning, cooking dinner, talking with the children a little bit and glimpsing at their homework; ironing a shirt, sewing a button or mending socks. This is followed by dirty dishes, the stink in the closet and dirty laundry waiting to be washed....Where is there time left for the husband! Other than for some practical tasks which cannot be postponed and some even more practical accounts and a...practical (after long procrastination) family love...

When is there time during a working day to admire the charm, manliness, wit and gallantry of he who is the father of the child...

Husband-Wife Relationship

Sofia TRUD in Bulgarian 15 Jan 86 pp 2-3

[Article by Tosho Toshev]

[Text] Can you imagine the situation of men whose wives have a higher social position? Wives who, at home as well, remain officials of the state, directors and chiefs....For, let us be honest, whatever revolution we may have carried out in the world of women, in the consciousness and morality of the Bulgarians, man remains the head of the family. Equality in labor, salary and opportunities in life is one thing; as to who is the head of the family is something entirely different. Our people (and they are not alone) have resolved this problem and applied it for millennia. Any twin power in this area, any form of female priority, trigger a greater or lesser coercion over our national mentality, natural feeling and aspiration of the man to be the protector and defender of the woman and the woman to be the defended, protected, the person who seeks and finds support.

Let us consider the last names of families: I for one am unaware of a case in which the family takes the last name of the wife, even when this name is quite prestigious, let us not consider powerful or phonetically better. It is true that it is no longer rare for the wife to keep her maiden name regardless of whether or not it is hyphenated with the last name of her husband. I dare to claim, however, that in most of these cases this not only does not contribute in any way to any kind of special prestige for the wife, but precisely the opposite: it has frequently brought about certain difficulties or unnecessary burdens both for the husband and the family as a whole, the more so since, generally, the children take the father's name. When children reach thinking age they can hardly understand why their own last name has nothing in common with the last name of their mother.

When we speak of the "head" of the family, naturally, in no case do we imply any kind of command, not to mention despotism. It is a question of the axis around which the family will rotate. Every atom in animate and inanimate matter has its nucleus. So does the earth. It also has a mental axis around which it turns. The entire solar system has a nucleus and an axis of rotation. It is not alone, for without an axis there would be chaos. The family as well must have a nucleus and an axis around which it rotates. The axis, as we know, supports the heaviest load. It is precisely the axis which resists the stress of centrifugal forces and holds together the components of the entity.

The husband alone can be such a natural axis in the family. Exceptions are possible but in such cases the circumstances are rather special, i.e., not entirely natural. Does practical experience not indicate that it is precisely where the man is in the center of the family microworld that events develop with approximately greatest accuracy? Some other prerequisites exist to this effect as well, for equality is equality and possibilities are something which has nothing to do with constitutional rights. Regardless of the financial emancipation of the wife, the main burden to support most families falls on the husband. Regardless of legally equal opportunities of the individual, hardly anyone would undertake to determine the time when the human possibilities of the husband and wife have become equal. Naturally, it would be stupid to say that one individual is more intelligent than another. However, is it not clear that, as a rule, even in the most feminized professions the leadership is virtually or almost entirely male? Let us consider medicine, science and the arts (not the performing arts but arts in which new spiritual values, which are timeless, are created, such as fiction, painting, music...). Let us not even mention areas, such as machine building, electronics, cybernetics, computerization, etc. Here the priority of the male is obvious and unequivocal.

The same priority should be equally unequivocal in the family. This, however, depends on both husband and wife. Yet it so happened that many modern women decided to begin with an attack, with an aggression and war precisely in this area. They take their right to equality literally.

We already mentioned the person most admired by women. The colleague...we also mentioned the person for whom they have the least amount of time....

On the other hand, however, turning things around, this entirely applies to the husband as well. For outside the family he is precisely that same charming, sweet, witty and so on colleague....This too has its respective prerequisites in life. The first among them is that deprived of his natural right to be the center of the family world, he becomes the center of another microworld of his, in his job and the enterprise where he spends the entire day. This is on the one hand. On the other, it is precisely there, outside the home, that he meets the woman in her most pleasant, most presentable aspect. There the woman is free, beautiful, tempting, and quite frequently active and aggressive....Let us consider a single feature: does anyone know of a case in which, coming home, the wife stand in front of the mirror, apply makeup, make herself more beautiful and more attractive and thus appear at her best?

I, for one, do not know of such a case.

As a rule, the woman puts on her best clothes, seeking a harmony of colors and moods, makeup and personal freshness precisely when she is about to go out, when she separates from her husband and goes to meet her colleague....As wife and at home she has her old clothes, worn out, eaten by the moths, smelling of onion and cooking oil. Who can compare the brilliance of the charm of the well-maintained and properly made up every morning charm with the loose skirt of the housecoat. As a rule, such a housecoat is always out of fashion, torn and sweaty.

Could anyone claim that all of this is accidental? Could anyone explain this by quoting lack of funds and clothing? I, for one, however they may explain it to me, I would disagree with all such arguments or, at least, I would put the following in the first place: the husband is hers. He is trapped. She does not have to make herself all that beautiful for him (the same, although in a different way, applies to the husband).

Gradually, from people who have loved each other more than anything else they turn into people who tolerate each other, despite everything else.

This may sound rather generalized and may be refuted with an infinite number of specific examples. It is also exaggerated but, as a rule, unfortunately is rather widespread and, which is worse, is a mass feeling....

Is there a person who could seriously claim that he is absolutely sure of his wife? (of her husband). That she is the dearest, the most beloved, etc., mother of children (or, respectively, father...) who is unable to be unfaithful? Furthermore, in discussing such a topic, even for the sake of not becoming ridiculous in the eyes of one's partner everyone allows the possibility of such unfaithfulness. He allows it in words, naturally, still hoping that it is precisely he that this tempest has spared somehow, or else hopes he will not find out about it. He hopes. This lie, which protects him from the truth, is to be more skillful, more real, more unshakable.

Now, pay attention! I claim that the main reason for the weakening of the centuries-old pillar described as marital faithfulness is, once again, the woman. Once again this reason is related to her social emancipation, which has become sexual as well. Read and understood superficially, it was precisely this situation that was brought about by this emancipation. Whether this is good or bad it all depends on the viewpoint. Some men are pleased: what could be better or more pleasant than the sweet magic of an extra-marital relationship! They simply do not consider that in this whirlpool their own wife may be drowning somewhere else, for in that case, she is simply with her colleague.

How nice it is that our wives have become better educated and better well-read, that they have become partners, people with whom one could engage in a dialogue. But how bad it is that it is precisely now, when we are pleased by this fact, that divorces are increasing, the birthrate is dropping and we are frozen by alienation. Instead of being a hearth in which the flames are fed crackling pine branches, the family fire quite frequently becomes a sham like the false fireplaces made for less demanding tastes, in which a red-colored electric light bulb is glowing. What comes out of such a fireplace is such a cold that not a dialogue but, quite frequently, even coexistence becomes impossible.

Skipping for a moment the deformations in the male psyche which have taken place, as well as a certain atrophy in the manhood (a topic for another article), once again it is as though precisely the woman is the one who should rescue the weakened pillars of the family, not by curling up within its shell, no. This is not only impossible but would also be wrong.

The man, the husband, should become the only one so that she too could be the only one. Not by beginning to lose her husband or losing him entirely, for after him the other will come. That one, the other, having lost the privilege of being the colleague, will pour his manhood into the cracked mold of marital life and will begin to look like the previous husband.

The wife must cast away her dirty housecoat....

She should wear her best clothing for her husband.

She must bring out his manliness, his gallantry, she should trigger them even when they are not there, she must admire his mind, his ability to work and his talent.

In the opposite case, what?

In the opposite case, divorce.

Or else, something worse: coexistence.

P. S.: The author realizes that in this article the role and place of the husband have not been analyzed with the same exigency as that of the wife. This, eventually, will become the topic of another article, for the problems are indeed serious and the family needs two people: a man and a woman.

Minkov Analyzes the Census Results

Sofia TRUD in Bulgarian 15 Jan 86 pp 1-2

[Interview conducted by Rumyan Georgiev]

[Text] The preliminary results of the December 1985 population census were published yesterday. On that occasion, an editor met with Professor Minko Minkov, chief director for this area at the Committee for Social Information, which carried out this important state assignment and is currently is processing the obtained data.

[Question] Do the already known results show something unexpected and disturbing?

[Answer] Nothing, from the viewpoint of the number of the population. Our preliminary sources and exceptionally accurate preparations for the census itself had already provided us reliable data on the state of affairs. We knew that we could not expect the type of increase which we had in the past. The so-called "two-children model" of the Bulgarian family is a reality for the country and is even eroding the large cities. In my view, this is not a threatening trend although this model cannot bring about an average annual population increase in excess of 21,000. Such increase is normal in a developed industrial country. In this case, what is more serious is that it could easily drop to zero and become negative. Obviously, we need a different, a "three-children" model.

[Question] How can we impose it? Appeals and well planned resolutions are failing to yield expected results so far.

[Answer] The old solutions concerning the role of the family and the woman are unquestionably expedient and necessary, although they are not operating with the expected strength. That is why during the new Five-Year Plan period social policy should be focused even more specifically on the problems of the family and, especially, on helping the young families, for which already now a great deal is being done.

[Question] We realize the complexity of the problem, so that let us not consider as basic the topic of housing....

[Answer] Data on increased number of housing and housing area per capita are impressive. The leap toward improvements is obvious. Nevertheless, we are behind countries such as the GDR and Czechoslovakia, which have more than 20 square meters of housing area per capita. We would like the Bulgarian family to have three children yet we are engaged in the mass building of housing which, at best, is for two-children families. Clearly unresolved entirely is also the question of the allocation of apartments. I can tell you, for example, that in my apartment, which is quite ordinary, there are seven of us....

[Question] Is it therefore not a waste for one out of each nine families to have a summer cottage?

[Answer] Such an assessment would be rather extreme. I consider this an accomplishment. For the first time we have been able to count the number of cottages and the data are pleasing. Under contemporary conditions a person should have his own place for relaxation. Let us not forget that there is a link between material and spiritual possibilities, although it may not always be mandatory or simply of equal value.

[Question] We fully agree. We gather that the number of cottages is not increasing exclusively through new construction but also with the help of the family house in the village. Is this not somewhat discouraging, however, in terms of the village?

[Answer] It is not astounding in the least that the majority of the population live in the cities. Fifty percent of all Bulgarian citizens, furthermore, live in cities of over 20,000 people. We are an urbanized society. Let us not forget that along with the expansion of the cities so does the number of former villages which have become cities. If there is anything we must oppose it is not migration in general but the depopulation of some areas in the country. The universally familiar decree No 22 should be fully applied, i.e., the people in these areas should have a livelihood. New jobs are the core of any system of socioeconomic measures. Naturally, we could also speak of living conditions. Huts and mud would hardly keep settlers in a given area. Another major question is that of their relationship with the local residents. We made a special study in this area as well, which will enable us to make more accurate decisions. Let me emphasize that, with the help of some publications, we have developed a rather erroneous idea of settlers. Most roughly, it is expressed with the term "money-grubbers." However, the situation is entirely different. In the majority of cases it is idealists that go to such places and it would be a great pity if they were to be disappointed.

[Question] Let us go back to yesterday's communication. It stipulates that the number of Bulgarian citizens of active age is declining.

[Answer] This too is not unexpected. Indeed, the decline is no longer merely relative as in previous censuses, but absolute as well. Naturally, it is compensated by the participation of people who have reached retirement age. Returning such people to active life is a pleasing and positive fact. It is very important, however, where those people will work and would this have adverse consequences affecting their health, etc. On the other hand, the decline in the number of people of active age urgently requires serious considerations and actions aimed at the intensification of public production and the faster and more daring application of the achievements of scientific and technical progress in production practice. In this sense, here as well, the census confirmed the accurate course charted by the party and the state.

[Question] This was obviously backed by the doubling of the educational standard of the nation.

[Answer] The significant increase in the number of individuals who have reached high educational levels and who, over the past 10 years, have increased by 65 percent, also confirms the democratic nature of the educational system in our country. We shall obtain data on acquired skills and jobs in order to evaluate the real results of the increase in educational standards. It is also true that a substantial share of the population has a below-average educational standard. No country can jump higher than its size. Let me remind you that until 1956 we had a 13 percent illiteracy rate and that the bulk of the population had grammar education. Few countries in the world have been able to accomplish what we have achieved in this area over the past 30 years. Even the introduction of mandatory secondary education does not automatically mean that everyone will graduate and that we will have people with high educational standards. Many years will pass until this system is fully operational. The initial conditions on the basis of which we are reproducing the educational structure of the population cannot be ignored. They also influence the psychophysical qualities of the children. There will always be those who drop out of school and we should work for their realization in society and for broadening their vocational choices.

[Question] The speed at which the public obtained the preliminary results of the census is a compliment to its organizers. However, we do not know very much about them.

[Answer] I believe that what the territorial computer centers, the people's councils and all the others who participated in this huge action have committed an exploit. Whenever someone builds a bridge under difficult conditions demanding total dedication, everyone finds out the name of the hero or the heroes. No particular noise was made concerning the work of the census takers and this work was ignored. It seems to me that they deserve better for everything they were able to accomplish.

[Answer] The folders in front of you probably contain curious facts which have not been included in yesterday's communication....

[Answer] What you are looking at are data from the okrugs. Indeed, these folders contain curious things and all of them will be officially published after we have finished with processing the data. Let me emphasize that for the first time the census was paralleled by an entire system of preliminary studies covering migration, jobs, individual problems, relations between town and country, the health status of the population, and so on, the results of which will be made public as well. They will provide us a comprehensive description of the Bulgarian people today.

[Interviewer] Professor Minkov, thank you for your responsiveness.

UNRESOLVED SOCIAL PROBLEMS IN AGRICULTURE EXAMINED

Sofia POLITICHESKA AGITATSIYA in Bulgarian No 19, 1985 pp 22-26

[Article by Docent Miladin Shaturov, chairman of the Trade Union of Agriculture and Food Industry Workers Central Committee: "Motive Force of Progress; Social Aspects of the March Plenum"]

[Text] The tasks in the area of agroindustrial production were concretized at the March plenum on the basis of the global party strategy of accelerating scientific and technical progress, as formulated in the speech by Comrade Todor Zhivkov at the February 1985 BCP Central Committee Plenum. The plenum's decisions are a comprehensive target program "...for the intensive and stable development of agriculture and the food industry, on the basis of the best achievements of scientific and technical progress."

The plenum, which adopted a comprehensive approach, paid great attention to the solution of the social problems facing agricultural workers. This approach is necessary, as Comrade Todor Zhivkov emphasizes, in order to convert social policy into "an active factor, a motive force for the development of the material and technical base and economic intensification." The essence of the party's general line "Everything in the Name of Man and Everything for the Good of Man" is being implemented through the comprehensive concern to meet the people's material, spiritual and social needs at each specific stage in our development. Radical changes were made in the social area and in the status of agricultural workers on the basis of the historical accomplishments in our economic development which followed the April 1956 BCP Central Committee Plenum. One of the fundamental principles governing the party's April social policy is the gradual equalization of working and living conditions of the working class and the agricultural workers, aimed at developing a socially homogeneous society within the historical boundaries of mature socialism.

Tremendous accomplishments were achieved with the help of this policy. Following are some data:

In 1965 wages per person employed in agriculture had reached 59.2 percent of the average annual wage in the remaining sectors and activities, and 57.5 percent of the average wage in industry. In 1983 the average annual wage per agricultural worker was 90.1 percent of the average for the other sectors and activities, and 85.4 percent of the average wage in industry. Adding to this the income from the private plots and other sources, income per agricultural family member exceeds the national average.

Our accomplishments in social insurance are of historical significance. After 1975 agricultural workers were offered virtually equal status with the other categories of working people in terms of retirement pensions, aid for temporary disability, maternity and child care.

Working conditions in agriculture are improving steadily.

Since the creation of the NAPS [National Agroindustrial Union] the state and the economic organizations have spent nearly 1.5 billion leva on the social development of labor collectives in agriculture and the food industry. More than 2,000 farming and machine parks were improved, cafeteria facilities expanded and transportation and consumer services to agricultural workers are improving.

This, however, does not satisfy us. The March BCP Central Committee Plenum formulated with great concern unresolved problems in the social area as one of the main prerequisites for manpower reproduction in agriculture and the food industry.

Which are these problems?

The first applies to the grave contradiction between new equipment and technology and the level of manpower training. No more than 10 percent of people employed in agriculture have higher or secondary training; more than 79 percent have primary school or even lesser training. No more than 28.5 percent of performing cadres are highly skilled and the number of unskilled workers is almost the same. In 1982 there were 1,314 unfilled positions for specialists with higher training although more than 4,800 university graduates with agricultural training were employed in other sectors and activities.

The age structure of the manpower is continuing to worsen and a critical situation is already developing in some areas. On a national average, more than 41 percent of those employed in agriculture are over 50 years old and only 12.6 percent are under 30. The main factor for this situation is the continuing drain of young and skilled manpower and the unwillingness of a significant percentage of young people to prove themselves in the field of agriculture.

The study of the reasons for this state of affairs and numerous sociological studies have indicated that the main knot in which problems of manpower reproduction and stabilization are entangled that of working conditions and wages.

The share of hard physical, manual and unattractive labor in this sector remains high. Despite achieved successes, living conditions in many livestock farms, farmsteads and repair workshops remain poor. Shelters and other facilities for hygienic work are unavailable in the fields. The problem of commuting to places of work is becoming aggravated; the range of cafeteria amenities and food distribution in the fields is unsatisfactory.

Another reason is related to the regimen of work and leisure time. About 40 percent of agricultural workers have converted to a 5-day work week but with a number of deviations; shift work in mechanization and animal husbandry is being applied too slowly.

Some problems in the field of wages have become apparent in recent years. In some cases wage standards are no longer consistant with the complexity, difficulty and social significance of the labor invested. Practical experience indicates that the lengthy and essential deviation from the socialist principle of equal wages for equal labor within the framework of the entire society, bearing in mind the general manpower shortage, intensifies its uncontrolable shifting from some sectors to others.

Some laws in the area of state and social insurance do not take sufficiently into account the specific features of farm work, it's seasonal nature above all.

As we can see, we have already covered a significant portion of the way to shaping a socially homogeneous society. Now, however, we must take a new step in this respect in order to stop some negative trends in manpower and agricultural reproduction.

One range of problems will be resolved with the technical retuning of agricultural production. The use of new equipment and other means of production and the application of essentially new technologies and organization of production and labor will, in addition to their substantial economic results, have important social consequences. The amount of heavy physical, manual and unattractive labor will diminish and its creative nature will be increased. On the other hand, however, this formulates new requirements and a new approach to upgrading cadre skills. This process must be uninterrupted, comprehensive and conducted on a high scientific and practical level.

Efforts to upgrade farm worker skills have intensified in recent years. In 1983, for example, more than 180,000 farm workers attended skill upgrading courses and schools. The figure is substantial in itself. However, considering the major lagging, such accomplishments are unsatisfactory. Furthermore, more than 82 percent of the students attended them to refresh their knowledge rather than to upgrade their skills. The skill level of a significant percentage of mechanizers, livestock breeders and working people in other basic farm skills remains unsatisfactory. This indicates that under the guidance of the party bodies and organizations, the economic managments of the trade union organizations and the Komsomol must develop a real movement for decisively upgrading the skills of agricultural workers. In the opposite case, the gap between the possibilities of material facilities and scientific and technical accomplishments, on the one hand, and the level of skills of the manpower, on the other, will increase with all the negative consequences that this entails.

The time has also come to apply a rating scale in crop growing, thus creating the necessary incentives for skill upgrading.

Some laws regulating wages of some farm worker categories must be amended comprehensively, attentively and substantiatedly. It is necessary, above all, to review the situation of mechanizers, whose wages in recent years have fallen behind those in some other sectors requiring identical skills and offering similar working conditions. This equally applies to crop growing workers performing manual work. Naturally, in the future as well, the amount of wages will remain most directly related to labor results, within the limits of the self-support of economic organizations and brigades and the skill level obtained by the individual working person. The mass application of various types of piece-rate work does not eliminate the need to improve the wage scale, for the piece-rate tariff must be based in all cases on the same wage rate in order to make the labor results of piece-rate workers comparable.

Other problems related to living conditions and work and leisure time regimes brook no delay. As early as the 9th Five-Year Plan, the necessary resources must be allocated to resolve the transportation problem, to improve the farmsteads and livestock farms and to create normal living conditions in the field. Currently all such problems are being discussed on different management levels and solutions are being sought. The main problems, however, related to living conditions are in the hands of the economic and trade union organizations and labor collectives. This is also indicated by past experience. Tremendous work on creating good living conditions has been under way in Tolbukhin Okrug for more than 10 years. An ambitious program was formulated and is being implemented under the guidance of the okrug PCB committee, which has contributed to changes in living conditions in animal husbandry and for most of the mechanizers. Successes have been achieved in production and in the social area in each okrug and APK [Agroindustrial Complex], where concern for production starts with concern for the first production force--the people.

The most immediate tasks in this respect are the following: improving working conditions in machine and farm centers, livestock farms and other work places; expanding the range of cafeteria feeding (providing hot food during the intensive farm season); decisively improving transportation to and from places of work; equipping livestock farms and farmsteads with sanitary filtration; ensuring the availability of mobile and stationary field shelters; improving work clothing and means of personal protection, from the functional and aesthetic viewpoints. In accordance with stipulations and the characteristics of agricultural production, converting to a 5-day work week and shift work.

Considerable efforts have been made in the past few years to expand the "High Living And Servicing Standards In Each Labor Collective" movement. Very good results were achieved by the brigades and APK in Lyaskovets, Tervel, Bregovo and others. All of this has been accomplished by the collectives themselves. The work place of the labor collective is like its home and life in it will be the way the collective structures and maintains it. It is neither possible nor correct to expect the solution of such problems to come from superior bodies and organizations. The real way is to eliminate the major disparities in working conditions between agricultural workers and the other categories of working people through the efforts and means of the labor collectives themselves. This increases the requirements facing economic and trade union managements as the organizers of the labor collectives.

At this stage, the social development of agricultural workers raises important problems also in terms of enriching the spiritual life of agrarian labor collectives and in the villages. Our achievements are tremendous but do not satisfy us. Observations indicate an alarming trend of disparity between material possibilities of individual agricultural workers and their spiritual interests. The requirement of molding a comprehensively developed individual demands the steady enrichment of spiritual life in collectives and villages. Exceptionally useful in this respect are the activities of the people's reading rooms, trade union houses, professional and hobby clubs, sporting and tourist organizations, and the intelligentsia in the countryside. Today we must coordinate even more closely their efforts for linkingmore closely their activities with those of agricultural workers and to concentrate, above all, on the brigade collectives. Here a rich spiritual life must be led and production-economic, social and spiritual interests must be satisfied in a state of dialectical unity. It is only thus that these collectives will become true socialist farms, creators of material and spiritual goods, implementing the party plans for the intensive and stable development of agriculture on the basis of the peak achievements of scientific and techinical progress. This will also help the people to become comprehensively developed individuals, citizens of a developed socialist society.

AMERICAN MASS CULTURE SATIRIZED

Prague TRIBUNA in Czech 23 Dec 85 pp 10-11

[Article by Jan Beran: "What Exactly Are They After?"]

[Text] For years the West has been trying to convince us that we are missing a lot by pursuing our own socialist cultural activities and opposing the "life-bearing" winds from the West which, as everyone knows bring only the best and most of everything.

We have used the term "convince" but apparently even in a simple matter like interpreting a simple word, we do not understand each other. The fact of the matter is that when he opposed these winds and continued to pursue that socialist culture of ours, they began "convincing" us that we needed this or that for our economy, that we had to (!) buy this or that film, that we must allow distribution of this or that periodical and even permit the American Information Service, USIA, to open an office in Prague. Well, here we do not call that "persuasion" but rather coercion and also blackmail.

Many places in the world have had rather bad experiences with the USIS centers (both the right and left hands of the CIA), as we did before February 1948. So, this did not work for them.

Simultaneously with all the above, they kept slandering us -- and do so to this day -- calling us some sort of "cultural desert," a dead arm cut off the mighty flow of world culture, etc., etc.

Sometime one has to wonder what this is all about.

As we know them from statements, such as yesterday "we will deny them everything and they will perish," or today "we will eradicate them as a historical error," we might rather expect that they would gladly wait until the "desert" overwhelms us or that we perish on that "dead arm." Strangely enough, this is not the case. At times its seems that they would like to suffocate us in that "cultural" embrace. The cultural forum in Budapest brought remarkable testimony of this. It is truly touching how some of these "cultural ambassadors" from beyond the sea would like to, whether we want it or not, teach us something in the field of culture and elsewhere. They fail to understand that the money they flaunt still reeks of blood, even today. They fail to understand that at the time their forefathers, in complete unity of purpose, were massacreing the Indians, our predecessors were already busy creating many cultural values.

When we first read in "Das Kapital" about the cruel dawn of the capitalist era, discovery of the gold and silver mines where the proletariat suffered, now certain "humanists" enslaved the native populations and buried them alive in these mines, how with the accumulation of capital and industrial development, the neoprotestant puritans offered bonuses in their legislative bodies for Indian scalps, and the British parliament (!) feted those who expropriated the Indians through a right given them by God and nature! We could not believe our eyes when we read about all that. For we have already seen many of the Hollywood westerns of the period, including those with Reagan in them, and -- lo and behold -- there everything was quite different.

According to those films, covered wagons rode peacefully over the prairie and hills toward new homes, men and women gazed at the western horizon with hope, looked forward to future harvests, debated what they will plant, children played with their dogs which they had brought with them. Campfires resounded with mournful songs of old Ireland, Germany, France and who knows what other countries. A Scottish blacksmith O'Hara and an Italian seamstress Petronella Campuccini just pledged that they would be married by the pastor on arrival. However, while these two and others were spinning their plans, the Indians surrounded them from all sides, and amidst their yodelings, scalps and whole heads were falling, wagons and property aflame, and eventually all the pleasant planning came to an end at the torture stakes. When all this was brought under control and the treacherous Indians were slaughtered or herded into reservations, there was nothing but song through hill and dale and the sound of hoofbeats. A few evil cowboys or farmers were wiped out by sheriffs, heroic gunmen and Judge Lynch, while other young couples were falling into each others arms in bliss, especially if the land they inherited from their grandfathers was blessed with gold nuggets, oil or diamonds.

In brief, everything was nice and smooth, we know this from the originals, as well as parodies. This, however, was not an innocent game but the dawn of a new era, the era of real "mass culture!"

A lively stream, springing from up at the speed of the scientific and technological revolution and the "technotronic" age. A nice little present for civilization from America.

Well, I had better stop improvising, lest you begin to suspect me of desperation. It is, therefore, better that I revert to the "classics." Let us begin with the well-known Mr. Zbigniew Brzeninski. There is a classicist and expert on everything, including "mass culture."

"England gave the world the parliament," he wrote in his super opus on America between two ages, "France donated liberty, equality and brotherhood, while America's contribution was the scientific and technological revolution and mass culture." He was not alone in this, there were and are others who do not lag far behind, such as Bell, Aron, Adorno, McLuhan, Marcuse, Rosenberg, Rostow, Fromm, etc.

You can see that if we devoted even a paragraph to them all, we would soon run out of space. Let us, therefore board Mr. Ray Bradbury's spaceship and explore the future with him. "The twentieth century? It was getting tighter and tighter in the world. Some sort of universal unrest broke out. People were constantly rushing somewhere, the roads were clogged. They became gasoline nomads. The cities turned into tourist camps, people into tribes of gypsies. The tempo was increasingly faster. Books gradually became loaded weapons. Producers of information, publishers, editors, step by step, eliminated everything that was useless, redundant, and not to the point, as wasteful thought. Books were becoming smaller. Abridged editions, extracts, let us not waste time. The share of the spoken word on radio and television was getting smaller. Let us, instead, get to the point and the outcome quickly. Tales were retold more briefly, extracts extracted. What about politics? A headline, one or two columns, eventually only sentences. Twist the human in a hurricane of impressions, interests, emotions, constantly new experiences. More food for the eyes: more films, more picture books (Click, Pick, Boom, Pink, Clop). Digest everything, wring it out and then do it again. Play to the human with the roar of motors, jets, motorcycles, racing cars, deafening music, screams of tortured victims. More sports shows, games, parties, festivities. More fun, more excitement and other such things. Away with thought, protect the human from such labor, from intellect and philosophy. More narcotics, pornography and idiotic contests, and humans will have the impression they are smart and educated. Protect us from people who through their opinions, theories, ideas and thoughts would bring misfortune on us, destroy this happy world of today. Destroy that weapon, that book in your house and your neighbor's. Burn it! And if the neighbor does not like it, burn him and his house down too, after all, what is he good for?"

The American writer of fantasy novels called the book from which he has just quoted **"Fahrenheit 51", the temperature at which paper** burns. In this novel, both thought and books are destroyed by specialized units of firemen.

The writer of these lines cannot possibly name the thousands of such "perpetrators" of mass culture and their masterpieces. In any event, they will be long forgotten in the twenty-first or twenty-second century. One can, however, call them what best describes them, namely, manipulators, falsifiers, psychological warriors and ideological diversionists.

In some respects, Bradbury's fantasy has alreday become reality in this century. It remains only to say that the fairy tales of the advent and dawn of the capitalist era are presented in contemporary capitalist mass culture in a way which is really closer to the havoc raised by the capitalists, as described by K. Marx in "Das Kapital," at least in the sense that it demonstrates how the capitalist system is able to deform the human being. We are indeed not speaking of the works by authors of progressive traditions in the West, who, naturally, are not afforded much opportunity by the mammoth publishing houses spewing out hundreds of titles for "mass cultural" consumption.

Let us now together imagine that the comrades coming after us find this "documentation" of what goes on in America, that they will see beings looking like humans shooting at each other, stripping each other's skins, stabbing one another in the back or heart, throwing each other from cliffs or roofs, burying each other alive, all this under the influence of some substances they ingest in liquid or powder form, with or without smoke, they steal from pockets, safes or homes, while dancing around jubilantly over piles of valuable paper, multicolored stones, yellow metal, etc.

But wait a moment, I forgot to mention what the proponents of this type of "mass culture" think about it themselves. They claim that it represents the "sum total of consumerist values, offered to the public with the help of mass communication means under the conditions of a technical civilization," as expressed by G. Friedman. "It makes no difference whether this occurs under the slogan of democracy or dictatorship, in planned economies or unplanned," adds E. van den Haag.

How they would love to convince the world (and us, as well as themselves) that "we need not have any scruples, we are all the same, this is all part of human frailty, it is the fault of neither side because it all stems from technology, electronics, exposure of nuclear secrets, chemistry, biology, etc."

And who in the world can stop technological progress? It allegedly has beneficial effects outside of life itself.

This view was crowned by a certain lady, when at a dinner given by the British government she declared, glass in hand ready for a toast: "To halt nuclear testing, testing of biological weapons, missiles, lasers and orbital bombs, would mean abandoning scientific and technological progress." This was six days before the meeting of President Reagan and M.S. Gorbachev!

This then is the results of the "beneficial influences of mass culture."

East Europe Report

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

EFFECT OF ECONOMIC REFORM ON PRIVATE FARMING

Warsaw DZIENNIK LUDOWY in Polish 19 Nov 85 p 3

[Text] Great hopes for an improvement in the condition of our economy along with the creation of a climate favoring further economic development and raising the standard of living of our society are placed on the economic reform that has been implemented for several years now. A consistent implementation of the reform is a prerequisite for extracting the economy from an extremely difficult situation.

By itself the reform is not going to create any new material substance or any new values. The economic reform aims primarily at the sphere of economic management. In simplified terms, it is contingent on the restriction of the so-called compulsory-directive (administrative) managerial methods while expanding economic methods, i.e. exerting an influence on enterprises, cooperatives, methods, i.e. exerting an influence on enterprises, cooperatives, farm collectives, workshops, etc., by means of economic instruments, such as prices, credits, taxes, allotments, interest rates, etc.

As these measures are carried out, the role of the market grows in setting prices, production level and structure, and also in other economic decisions made by economic units. It is assumed, and rightly so, that by means of economic instruments it is easier and better to stimulate and, as a matter of fact, force improvements in economic efficiency than by means of administrative measures.

However, a considerable expansion of managerial freedom by economic units must not entail the unleashing of unwanted economic processes. Greater rights are as a rule linked with greater responsibility. Hence, greater economic independence of farming units calls for intensified control of their activities by the state, particularly in the area of production, compliance with ecological requirements, and in a general concordance with overriding interests of the state and society.

I feel that private farmers understand better than other farmers the essence of the economic reform, because they have been farming for a long time in accordance with its principles, which is the principles of the three "esses": self-management, self-control, and self-financing. Hence, the direct effect of the reform on private farming is smaller than on state farming, for instance.

As an afterthought I might add that thanks to the considerable loosening of the compulsory-directive corset in the management of state farms, these farms were able to achieve substantial improvements in their economic results.

The economic reform does not violate the essence of private farming, nor does it substantially alter the principles of its operation, particularly the rules for making production decisions and financing by the farmer. However, this does not mean that private farming is exempt from the effects brought about by the reform, nor does it permit the farmer to watch indifferently its progress as it is implemented in the national economy. On the contrary, the implementation must remain the topic of the farmers' watchful observation and interest, including their political and socio-professional organization.

The economic reform will have an effect on agriculture, which means it will help to realize the farmers' goals and economic interests to a greater extent than it would seem at first glance. Moreover, the statement that in this day and age nonfarm divisions of the national economy are instrumental in agricultural development is a mere truism, and this is not cogent about the industry. Besides, while recognizing the undeniable link between reform and productive-economic results of nonfarm divisions, we may postulate that the implementation of the reform in those very divisions, especially in the industry of production resources for agriculture and in the food industry will effect not only the supply and cost of food products, but also the shape and efficiency of agricultural production plants. This is why farmers place on the reform well-understood expectations for a greater market supply both of agricultural production resources and consumption goods, which means better quality goods at cheaper prices.

The national economy operates on the basis of its nature as a system of communicating vessels. Consequently, the extent of the reform's implementation in nonfood branches of the national economy defines the progress in overhauling the food economy, hence the development of agriculture itself.

It is safe to assume that the true effect of the economic reform on private farming will be multifarious.

The importance of economic instruments in agricultural management will continue to grow. By the same token, the economic reform also means a deviation from the process of price controls and the allocation of greater resources to agricultural production. The cost of those resources will depend on to an ever greater extent on the market, being the outcome of the ratio between supply and demand. Of course, the role of other economic instruments will increase, too. The deviation from the process of price controls and distribution should also help to reorient offices handling actual farm servicing, eliminate waste of farmers' time that presently occurs in those offices, as well as at purchase agencies of agricultural products. After all, such time may be used more profitably for direct production activity.

Streamlining the area of agricultural production services and industries working in support of agriculture, streamlining the agro-nutritional industry to operate in line with the principles of the reform should help to coalesce their economic interests with the interests of agricultural producers. In other words, the influence of non-agricultural economic units on private farming will be enhanced. Consequently, the economic output of the farmer will be more dependent than in the past, be it merely in the price area, on agricultural factors. Then, on the one hand, only high-yield and high-income private farmers will become attractive purchasers of resources of agricultural production, and, on the other hand, only such type of agriculture can ensure a sufficient, high-quality and moderately priced supply of agricultural products for further food processing.

Subsequently, we may expect an intensification of the "incorporation" process of private farming into food chains, with well-defined technological, qualitative, and economic patterns. This will affect in particular such phases of those chains, as agricultural production services, agricultural turnover, preservation, and the agro-nutritional industry. This sort of situation will create certain restrictions in decision-making for agriculture, though it will hopefully release new creative forces to push ahead the agricultural progress. In the context of inexorably intensifying processes of a material integration, the primary factor of importance for farmers is not to see their strength sapped in contacts with the naturally stronger and better organized industrial partner. Hence, any changes in the organization area of industries working together with agriculture, especially the food industry, will have to be closely monitored by farmers and their organizations. In this context, among other thing it will be presently important to ensure that trade associations in the food industry, both compulsory and voluntary, are not converted into permanent monopolistic organizations dictating market conditions to both farmers and consumers. If we are unable to prevent such a development, the common cause of economic interests of farmers and workers in the food industry will be violated, and we will have to face all further negative consequences of such a situation.

The economic reform creates new demands in the field of long-wave transformations and adjustment processes in private farming. Those transformations and processes call for an accelerated tempo.

In this regard the situation calls for both transformation of the agrarian structure and a technical modernization of agriculture, as well as for creativity and implementation processes of a biological and organizational-technical progress. We must bear in mind that a consistent implementation of the principles and regulations of the reform will constantly subject to both economic and social criteria those principles that are assumed to be favorable for agriculture, such as the principle of income parity, for one. This is because the reform calls for a broader and deeper support of political establishments by economic activities, and by shoring up such establishments by economic means. Hence, new demands are imposed on farmers and their organization with regard to a rank-and-file drive building up inside so that it may effect transformations in the scope of private farming. Yet, all this must not entail a relaxation either of the entire national economy, or, moreover, relieve the government from its responsibility for the future destiny of private farming.

Dr. Hab. Jozef Zegar
Deputy Director of the Institute of
Agriculture and Economy and Nutritional
Industry.

BRIEFS

CSSR RESEARCH, PRODUCTION COOPERATION--East Berlin (ADN)--On Tuesday [22 January] Horst Tschanter and Josef Voracek, deputy chairmen of the GDR-CSSR Joint Economic Commission and deputy chairmen of their countries' State Planning Commissions, started deliberations in Berlin on the development of economic and scientific-technological cooperation. They discussed steps for further deepening cooperation in science and technology as well as for achieving specialization and cooperation in research and production. They also studied possibilities of increasing mutual commodity exchange. [Excerpts] [East Berlin NEUES DEUTSCHLAND in German 22 Jan 86 p 2] /9604

GDR-YUGOSLAV PROJECT COORDINATION--Belgrade (ADN)--With coordinated projects for deepening their economic relations, the GDR and Yugoslavia are following the path into the just beginning new 5-year plan period. The most recent agreements for the period up to 1990 are based on the results of the official friendship visit by Erich Honecker in October 1985 to the SFRY. The joint efforts are focused on increasing the scientific-technological level of products and on the application of highly efficient technologies. [Excerpts] [East Berlin NEUES DEUTSCHLAND in German 11-12 Jan 86 p 5] /9604

METALLURGY MINISTER COMMENTS ON KEY TASK PRIORITY

Prague HOSPODARSKE NOVINY in Czech No 43, 1985 pp 1, 6

[Article by Eng Bohuslav Najbrt, CSSR minister of metallurgy and heavy machinery]

[Text] Supplier organizations of our department have been participating through direct deliveries in the building of 213 construction projects this year--priority constructions of the state plan. In most cases these are constructions which will serve manufacturing. The entry into this year can be characterized, as far as the technical equipment for the priority constructions is concerned, first of all by the fact that we entered it with fewer unfulfilled deliveries from the previous year then has been the case in the past. In 1982 the plan for putting facilities into operation was fulfilled up to 72.5 percent, a year later up to 88.2 percent, and last year up to 94.7 percent.

Everyone Has His Own Task

On the other hand, however, adverse weather marked by waves of hard frosts in January and February 1985 had a negative impact on the progress of work on priority constructions. This was evident no only in disruptions of assembly work, but also in delays in construction readiness to begin such work. Also, the delays of assembly work by some of our suppliers led in some instances to deadlines for equipment readiness not being met, most of all for the economic production unit "Electromont," whose organizations provide high voltage power distribution systems and technological process control systems.

Some investors, obviously influenced by several consecutive mild winters of previous years, are not making adequate preparations for winter to ensure that not only the assembly work of equipment, but also the work by subsequent suppliers need not be substantially restricted in case of low outdoor temperatures. On the other hand we recognize the fact that keeping down consumption of high grade fuels, which are often used for this purpose, considerably limits the investors' options.

This is also why we cannot agree with the opinions of some workers of our supplier organizations, who demand excessive winter preparations. They usually rationalize it by insisting that if they were not to ask for substantial winter provisions in time, they would not get even that which is absolutely necessary. However, such an approach results in disparities among those participating on the construction, that is, the investor, the general contractor, suppliers of building materials, suppliers of equipment, including their sub-suppliers. In addition, it makes comradely cooperation, which is absolutely necessary for solving problems, more difficult.

To my mind, the greatest potential for improvement lies in timely resolution of problems at the lowest levels of management, which are closest to the source of those problems. Too, it is easier to choose a realistic solution out of several possibilities on the site of the construction itself, rather then bringing it for resolution to the departmental level of the participants concerned with the construction. It is not unheard of that arbitration of conflicts is shifted to superior officials with delays, without adequate information.

We are at fault in that we are not consistent enough when it comes to demanding responsibility from some workers of the general management of economic production units who are superiors of the suppliers of technical equipment. As a consequence, because of the danger of losing time, these issues are not sent back for resolution to the appropriate lower level, and departments are dealing with problems which are not theirs to resolve. In cases, where adopted measures do not prove to be the optimal resolution, considering the situation at the specific construction (where in the meantime quick changes may have occurred), the responsible workers of the department are open to criticism. They, however, often must make a decision based on inadequate data received from the lower levels of management.

Such an incorrect procedure often leads to renewed conflicts and consequently to putting government deadlines for trial runs of facilities at risk. It needs to be said that these undesirable occurrences in capital construction do happen, and it is possible--even if it requires great effort--to track them down, even though they are not always presented as renewed conflicts but as new ones. However, most often they come to light while problems, which were the result of just such unsupported actions, are being resolved.

We at the ministry are aware of such shortcomings. We are, therefore, going to increase our control in this respect, so that we can arrive at specific charges against those responsible, or, as the case may be, direct the general managers to make those charges.

What to do About Billing Notices

They are, however, matters which at present we are unable to influence and which often distort the economic results of a department or individual economic units. In the first place it is the matter of the effect stemming from applying the directive of the Federal Ministry of Finance No. 37/1983 Sb. (Laws of the Czechoslovak Socialist Republic), concerning billing and payment of deliveries for capital construction and geological work. In general, we value positively those provisions of the directive which are designed to enhance the effectiveness of capital investment, eliminate deficiencies which have persisted over a number of years, and increase the level of all managerial and organizational actions in order to achieve an overall improvement in discipline, order, and higher requirements for quality of work.

A far more demanding system of reporting essential requirements for billing for work performed and for deliveries, most of all completed deliveries, which is required by the directive, greatly increased the demands on suppliers of technical equipment. However, this measure also brought about some negative features, to which the suppliers are constantly pointing. For example: although some deliveries have already been used in the construction, it has not been possible toward the end of the first half of 1985 to certify them through the verification protocol as required by the directive No. 37/1983 Sb. These cases concern mostly supplementary operational projects, which hardly any large construction can do without at the present time. Agreements on marketing costs of these supplements cannot be made in time. This matter has to be considered from the point of view of the reasons which caused it. It may concern deficiencies which stem directly from the actions of the executor of the operational projects, which in the case of technical equipment usually is the supplier organization itself. Or it could be deficiencies in the initial projects which are being worked on by the general supplier. For the sake of objectivity I must add, that in the framework of technological assistance, suppliers of technical equipment provide a technological base also for this stage of project preparations.

Most serious are the consequences stemming from various exceptions which were put through in the past by the investors' superior agency, so that they could begin work on constructions before adequate project preparations have been made. The provisions of the above mentioned directive are not responsible, obviously, for the serious difficulties which are experienced by the suppliers of technical equipment; it is the circumventing of the strict regulations that apply for the start-up of mandate constructions.

I have endeavored to show through this example how difficult it is to find the offender in these instances. All such supplementary deliveries naturally result in decreased efficiency of capital investments and clearly prove that it is not possible to make exceptions in allowing construction to begin, especially in the category of priority tasks of the state plan.

We must not forget to mention also some of the other reasons which are involved in the above mentioned unfavorable state of affairs, for example, the fact that final suppliers are late in turning over to the general suppliers certification of tests that were performed, without which the investor cannot show evidence of completion. We have to admit that this concerns relationships among supplier organization of our department as well. But experience shows that to eliminate such seemingly formalistic deficiencies always takes a considerable time.

This can be seen from the way in which reports are made about fulfillment of progress milestones on priority constructions established by directive No. 157/178 Sb., concerning the management of constructions, which was introduced into practice as a previous beneficial step for improving the management of priority construction. A notification that assigned tasks have been fulfilled is turned over through investors' channels to the State Commission for Technological Development (formerly Ministry of Technological and Capital Development). However, throughout the entire length of time that this regulation has been in effect, it has not happened yet that the quarterly notices concerning technical equipment deliveries have ever been complete--every time one or more of the progress milestones are not reported by the investors, even if they had been accomplished. This happens because investors do not give the necessary attention to this administrative process. During a control session, which took place on May 23, 1985 in the office of the vice-premier of the CSSR government and chairman of SKVTIR Dr Jaromir Obzina, DrSc, concerning provisions for guaranteeing implementation of the tasks of the state plan for capital construction and technological development during the first quarter of 1985, another measure was adopted to deal with this problem. The fulfillment of progress milestones has to be confirmed in the appropriate place on the notice not only by the investor, but the supplier as well. But obviously not even this measure will resolve the problem.

Plan and Reality Differ

As in the case of tardy administrative reporting of individual tests, so in the case of meeting progress milestones, what is lacking is basic discipline, and the matter has to be judged accordingly. In both cases the results of the work of the supplier organizations are distorted, and based on inadequate information to central agencies their actions are negatively influenced. In reference to directive No. 37/193 Sb., it is worth mentioning that following discussions of supplier-consumer relations in the coming year, the state plan mandated a greater volume of deliveries than was the case during substantive discussions of the management of individual construction projects in the first quarter of this year. The reason for this disparity is the fact that in the first half of 1984, when supplier-consumer relations were being negotiated, neither the investors nor the suppliers knew the exact volume of deliveries needed.

Again, unconcluded pricing matters were the main culprit. In this instance, naturally, it does not mean a softening of the state plan, because as far as material supplies are concerned, the volume of deliveries required by investors for this year remains the same.

As a consequence of these disparities, considerable complications arise at those construction projects where progress milestones have not been established, and therefore their quantitative achievement is being evaluated toward the end of the year. This is a serious problem, because of the above mentioned 213 priority constructions on which we are participating through direct deliveries of technical equipment for investors, progress milestones for supplier organizations of our department have been established only in 150 of the capital construction projects.

In the case of constructions where all facilities have been put on a trial run, investors are well-disposed to secure from the local branch of the Czechoslovak

State Bank a certificate for the suppliers confirming that this represents a saving. But in the case of constructions which have not progressed very far, suppliers often have to be satisfied with a certificate issued by the investor or by his superior agency (because the investor refuses to acknowledge such a saving to the Czechoslovak State Bank as deductions would follow). It is worth mentioning that a reduction in the volume of deliveries in 1984 occurred only in the case of nuclear power plants consequent on the pertinent resolution of the Presidium of the CSSR Government.

This state of affairs has had an extraordinarily unfavorable impact on the evaluating of quantitative fulfillment of tasks by individual economic production units of priority constructions at the end of the year. This applies mainly to the category of concluded deliveries, which is mandatory according to the plan.

Which Way Into the Future

To close, I shall discuss the accomplishment of work and deliveries for constructions--mandatory tasks of the state plan for the first half of the year in comparison with the same peiord last year. During the first half of 1985 the total volume was 2,678.6 Kcs, which represents 31.8 percent of the annual plan. If we leave aside deliveries for the nuclear power industry, the volume of all other deliveries for priority construction for the first half of 1985 was 1,694.9 million Kcs.

Last year, the overall fulfilment during the first half of the year was 1,842.7 million Kcs, that is 19.4 percent of the annual plan. Not counting nuclear power industry, this amounted to 1,338.6 million Kcs, that is, 28 percent. These figures contain only planned direct deliveries for investors, not sub-deliveries, such as, for example, for suppliers of steel constructions.

The state plan (after certain modifications resulting from approved changes in mandatory construction indicators by the appropriate resolution of the Presidium of the CSSR Government) requires that 77 facilities be put on trial run. This number includes only those facilities which we are helping to build through direct planned deliveries for investors. Not counting facilities for the nuclear power industry, it means 73 facilities. Of those, the state plan requires that 30 be put on trial run during the first half of the year. 22 facilities have been put on trial run within the established deadlines. This includes also two facilities which were put into operation ahead of schedule, which was not until the second half of 1985. Another six facilities were put on trial run with a delayed deadline, but still in the first half of this year. Altogether, therefore, 28 facilities have been completed, that is 93.3 percent. In the second half of this year we are expected to put 45 facilities on trial run.

The demanding nature of the tasks connected with guaranteeing that priority tasks of the state plan are implemented, provides room for workers' initiative on construction sites, as well as in manufacturing organizations which ensure the necessary deliveries. We appreciate the complicated work of the investors, because even in the capital constructions of our own department we can see what problems they have to solve.

At the annual general meeting of the Czechoslovak Communist Party, conferences, and all-plenary sessions, the results achieved in fulfiling the priority tasks of the state plan will be assessed. In accordance with the 15th Plenum of the Central Committee of the Czechoslovak Communist Party, evaluation and critical appraisal will be made also of the measures adopted in accordance with economic policies for fulfiling the plan for this year and prospects for fulfiling it in 1986 and subsequent years of the next 5-year plan. Future results which we shall be achieving in this very important sector of the national ecnomy are directly dependent on political and economic actions prior to the 17th Congress of the Czechoslovak Communist Party.

ADJUSTED VALUE ADDED EFFECTS ON ENTERPRISE ACTION VIEWED

Prague FINANCE A UVER in Czech No 8, 1985 pp 542-548

[Article by Eng Frantisek Bernat: "Effect of Adjusted Value Added on Enterprise Action"]

[Text] In his article "Adjusted Value Added in Engineering and the Creation of Wages Payable" (FINANCE A UVER No 12, 1984 p 816) Eng Alfred Sebek discussed, among other things, the methods of increasing adjusted value added (AVA) or of exceeding its planned volume. He stated that one cannot ignore the method by which savings of certain items of material costs are achieved (for example, costs of repairs which enterprises justify mainly by referring to inadequate repair capacities of the suppliers). "The opportunity to calculate wages on that basis according to AVA must be regarded as totally unjustifiable. After all, this is a completely unmerited increase in AVA as well as unacceptable maintenance of capital assets."

Obviously A. Sebek had in mind a failure to make necessary repairs of capital assets. In this concept one may fully agree with him, or as the case may be, one may support his view, because the lack of repairs will also be reflected in unearned increases of profits and in accumulation of additional undeserved resources of wages payable (at present the movable factor of wages payable), or because of the gain of other material advantages, such as allocations to incentive funds. This is an old problem in the management of enterprises which occasionally prefer to report good results now rather than to ensure long-term objectives.

The question whether this is a case of neglect in making necessary repairs of capital assets, however, is linked with a series of problems and is not as simple as it may appear at first glance. It is a fact that lower initial repair costs (reported in accounts in accounting class 3 and constituting a factor of material costs in the calculation of AVA by the method of deduction) may be connected--if we set aside potential consequences of price changes--in particular with:

--better general care for capital assets (including the so-called maintenance) and with a better quality of repairs, which make it possible to postpone the repairs for later and thus, reduce repair costs;

--with repairs made by the enterprise instead of repairs previously made by the supplier, or vice versa.

We shall attempt to take a closer look at the latter of the above-mentioned problems in the next part of our article.

Effect of the Method of Repairs on AVA and on Wages

Let us assume that the enterprise has two alternatives: to contract the suppliers for the repairs, or to undertake the job by its own work forces. Naturally, its decision will be reflected in the amount of AVA or in its internal structure, as shown in Table 1.

Table 1.

	Repair made	
	By the supplier	By the enterprise
Total outputs of the enterprise	1,000	1,000
Costs of materials (without depreciations) and services of nonmaterial type (not including the item below)	650	650
Costs of materials for repair	50	20
Adjusted value added	300	330

This diagram demonstrates that the enterprise may raise its AVA by 30 if it reduces by 50 the costs of repairs made by the supplier, however, it must pay 20 for the materials required for the repair which it does with its own forces.

If the enterprise's standard of the basic factor of wages payable is set, for instance, at 40 percent, its wages payable are increased by 30 x 40 percent = 12, if it does the repair on its own. Which method of repair will be enterrpise choose under such circumstances, if it takes into consideration only the effect on wages (which is very frequently the decisive criterion)?

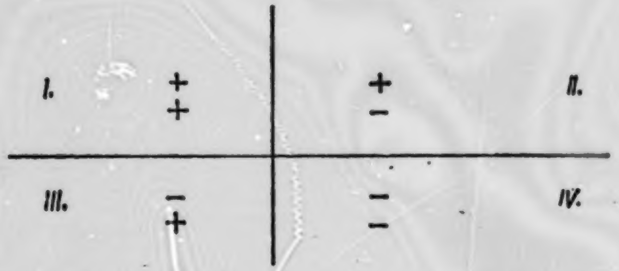
The most important consideration is how high are the wages required for the repair at the enterprise's own cost. If the repair demands wages amounting to 15, the enterprise "loses" 15 - 12 = 3 in wages. The enterprise would have to save this amount on some other wages (for instance, by cutting down the rate of growth of average wages or by rationalization measures). Thus, the enterprise would hardly opt for such a repair job, but hire the supplier for the job.

If the repair done by the enterprise itself calls for wages amount to 10, the enterprise gains 12 - 10 = 2 in wages. Wages payable of the enterprise will increase by that amount over the necessary costs for the repair, which the enterprise may use, for example, to raise average wages. The enterprise will not hesitate to undertake the repair by itself.

How will the supplier react? Let us assume that the wage standard amounting to 35 percent of AVA is stipulated for the supplier and that the repair contributes an amount equal to 28 to AVA. Thus, by making the repair, the supplier earns wages payable amounting to 28 x 35 percent = 9.8. So long as the repair calls for lower wages, for instance, 9.5, the supplier is interested in undertaking the repair job. On the other hand, if the repair requires wages in the amount of 11, the supplier will refuse the job, because he would lose 11 - 9.8 = 1.2 in wages.

We can see that the interests of the enterprise and of the supplier may conform as well as disagree in deciding about the repair job. We may express this with Figure 1, which is divided into 4 quadrants, where the upper symbols signify the interest of the enterprise in having the repair done by the supplier, and the lower symbols the interest of the supplier in undertaking the job.

Figure 1.



Quadrant I respresents idential interests on the part of the enterprise and of the supplier. The enterprise is interested in assigning the repair job to the supplier, because for it it would mean a loss to undertake the repair; the supplier is interested in the job, because he will earn more in wages than the amount of his costs for the wages for the job.

Similarly, in quadrant IV the interests of the enterprise and of the supplier in the repair are identical, however, if compared with quadrant I, the enterprise is interested in doing the repair by its own forces and not by the supplier, while the supplier refuses to accept the job, because by doing it he would suffer a loss in wages. Repairs made by the enterprise itself are advantageous for both partners.

In quadrant II the interests of both partners differ. The enterprise is interested in having the repair done by the supplier, but the supplier is unwilling to accept the job, because it would not create wages payable needed for that particular job. The position of the enterprise with respect to the supplier is weak in this case; the enterprise must undertake the repair by its own forces, even though that will lead to problems in terms of wages.

Neither is the situation in quadrant III favorable. The enterprise wants to do the repair on its own and not to assign it to the supplier (for whom it is advantageous as concerns wages), while conversely the supplier tries to undertake the repair job (he would be at advantage in terms of wages). The position of the enterprise here is decisive--it will do the job on its own.

The above-mentioned division of possible instances of agreement and conflict between the interest of the enterprise and of the supplier concerning repairs may also be expressed numerically. For that purpose we shall use the data on wages from the preceding text.

In Figure 2 the first line in each quadrant represents the amount of wages required for repair done by the enterprise itself (15, or 10); the second line expresses wages necessary for repair done by the supplier (o.5, or 11). Symbols + and - express (in conformity with the preceding diagram) the interest of each partner in having the repair done by the supplier. The figures in parentheses express the contribution of the repair to wages payable of the enterprise or of the supplier.

Figure 2 clearly shows that the conformity of interests of both partners in quadrants I and IV makes it possible to reduce the wage demand for the repair by 5.5, resp. by 1.

Figure 2

I.

For the enterprise (12)	15 +
for the supplier (9.8)	9.5+
Difference	5.5

Agreement that the repair be done by the supplier.

Wages saved 5.5

II.

For the enterprise (12)	15+
for the supplier (9.8)	11-
Difference	4

The enterprise wants the supplier to do the job, the supplier refuses. The enterprise does the repair for 15.
Wage loss 4

III.

For the enterprise (12)	10. -
for the supplier (9.8)	9.5-
Difference	0.5

Enterprise intends to do the job by its forces, the supplier wants the contract. Repair done by the enterprise for 10.
Wage loss 0.5

IV.

For the enterprise (12)	10-
for the supplier (9.8)	11-
Difference	1

Agreement that the repair be done by the enterprise for 10.

Wages saved 1

In quadrant II, where the enterprise itself is forced to make the repair at wage costs equal to 15, there is an unnecessary loss of wages amounting to

4 only because by doing the repair under contract the supplier would make the repair at a lower wage cost (11) than the enterprise (15), but he would lose money in wages equal to 11 - 9.8 = 1.2, and therefore, he does not accept the job.

In examples presented in quadrant III there is a wage loss equal to 0.5, because the supplier could do the job at lower wage costs (9.5) than the enterprise, but the enterprise will do the job on its own, because then it earns from AVA funds in the amount of 12, as compared with the requirements for the repair amounting to 10. This solution is advantageous for the enterprise, although the enterprise must pay more in wages than the supplier.

In terms of the repair conflicting interests of the enterprise and of the supplier, represented in quadrants II and III, may thus lead to public losses in the wage sector.

This conclusion applies only under the above-mentioned assumptions concerning the amount of wage standards, the effect of the repair on the amount of AVA and on wages required for the repair, both by the enterprise and by the supplier. If the same method (characterized by the four quadrants) is used, but the premises are different, the above-mentioned conclusions may change, as documented by an example from Figure 3, where:

Figure 3.

I.		II.	
For the enterprise (12)	13+	For the enterprise (12)	13+
for the supplier (10.5)	10+	for the supplier (10.5)	11-
Difference	3	Difference	2
Agreement that the supplier do the job for 10. Wages saved 3		The enterprise wants the supplier to do the job, the supplier refuses. The enterprise does the repair for 13. Wage loss 2	
III.		**IV.**	
For the enterprise (12)	11.5-	For the enterprise (12)	11.5-
for the supplier (10.5)	10.0+	for the supplier (10.5)	11.0+
Difference	1.5	Difference	0.5
Enterprise intends to do the job by its own forces, the supplier wants the contract. Repair is done by the enterprise for 11.5. Wage loss 1.5		Agreement that the enterprise do the repair job for 11.5. Wage loss 0.5	

--we leave the wage standard (40 percent) as well as the increase of AVA (by 30) in the enterprise and thus, a contribution to wages payable (12), however,

--we change the wage standard of the supplier from 35 percent to 30 percent and the AVA increase from 28 to 35, and thus, the supplier gains the amount of 10.5 for his wages payable (instead of 9.8); furthermore, we change the wage demand for the repair.

From the example we see that the interests of the enterprise lead to losses of wages in quadrants II, III, and IV.

With different premises the wage loss may occur in all four quadrants, or vice versa--profits in wages may be noted in all four quadrants.

We know of no simple and practical mechanism which would present the development of wage loss stemming from the interest of enterprises in the accumulation of wages payable, because the same wage standard cannot be stipulated for every enterprise, nor can such prices be set that would ensure every enterprise the same volume of wages for all its outputs, derived according to the same standard from AVA.

Effect of Repair Contracts on Efficiency

Thus far we have restricted ourselves to an inquiry about the effects of contracts for repairs (by the supplier or by the enterprise) on the amount of AVA and on wages. Understandably, wage demands are a criterion which does not necessarily express--and often cannot even express--the economic efficiency of repairs. If we deliberately narrow the concept of economic efficiency to costs alone, we may use an analogical diagram to divide various variants into four quadrants.

In quadrant I it is in the interest of the enterprise that the supplier undertake the repair because that is cheaper than if the enterprise itself would do the job. The supplier is interested in the job, because it is lucrative (or above-average lucrative) for him.

The interests of the enterprise and of the supplier are in agreement also in quadrant IV. It is to the advantage of both partners if the enterprise undertakes the job: the enterprise will make the repair at a lower cost; would the supplier take the job, he would either lose or earn less than for his other work.

There is a conflict of interests in quadrants II and III. In quadrant II it is advantageous for the enterprise to assign the repair job to the supplier (if it undertakes the repair with its own forces, it would be more expensive); however, the supplier does not accept the job, because it would mean a loss or below-average profits for him. Therefore, the enterprise is forced to undertake the job by itself and at a higher cost. In quadrant III the enterprise itself does the job (it is not interested in assigning it to the supplier, because that would be more expensive), but the supplier would gladly take the job (because it is profitable, or above-average profitable).

As in the case of wages, so in costs the decision of the enterprise and of the supplier in quadrants I and IV is socially advantageous because the variant with lower cost is used. In quadrant II the repair is done at higher costs than the other partner would charge for the repair job. An analogical case may be that in quadrant III, where the supplier's costs are lower than the costs of the enterprise, and only the profits included in the price of the repair by the supplier render the repair done by the enterprise less expensive.

Such conflicting interests of the enterprise and of the supplier lead to public losses--to outlays of higher costs than necessary. One of the causes of such public losses is the current practice where profits are not included in the costs of repairs done by the enterprise itself and as a rule, not even in administrative costs, while both those items are included in the supplier's price; this drawback may be overcome only by drastically reduced supplier's costs.

At this point one must consider that both the above-mentioned criteria (the wage criterion and the cost criterion) used in selecting the kind of repair must lead to the selection of the same variant. In terms of wages one variant may be advantageous for the enterprise, but in terms of costs and profits it may be disadvantageous. At present approximately 80 percent of wages payable are determined by AVA; even more will be based on AVA starting in 1986, when wages payable will completely depend on the development of the (changed) AVA. The determinant is now and will be in the future that of the consideration of wages before the consideration of costs and profits--before the consideration of economic efficiency. Of course, in specific cases the enterprise will carefully weigh the ramifications of higher costs and lower profits when selecting the variant which in terms of wages is of advantage to it.

Our entire consideration is based on several premises that must be respected, or they may affect the decisionmaking of the enterprises in a fundamentally different way than our conclusions:

1. There are realistic and applicable variants of the selection of the method by which the repairs are done by the supplier or by the enterprise itself;

2. Not only the specific costs of repairs undertaken by the enterprise and by the supplier, but also AVA of individual repairs done by both partners may be determined. Because it is extremely laborious, if not impossible, to determine accurately the amount of AVA in individual outputs (repairs), approximate calculations of ("modified") AVA are sufficient for practical use; such approximate calculations involve only the deduction of direct costs of materials from the outputs (consumption of materials and energy, tools, etc.), or as the case may be, also the deduction of semifinished goods manufactured by the enterprise, and the result is multiplied by a coefficient

which is less than 1, in order to express the undetected costs of materials and of services of the nonmaterial type;

3. Repairs doen by the enterprise itself and by the supplier are of the same quality and their completion requires the same idling period of capital assets which cannot be used while the repairs are under way.

Expansion of the Consideration to Other Economic Operations

Our considerations pertained thus far to repairs of capital assets alone. We may conveniently use the data obtained in that process in other economic operations and thus, determine not only the positive, but also the potential negative effect of AVA on the decisionmaking of enterprises from the public viewpoint.

As regards repairs, there are the following variants: those done by the supplier and those done by the enterprise itself. The conclusions we have reached may also be conveniently applied to cooperation, if the enterprise is able to obtain materials (parts, semifinished products, etc.) from its own production or procure them from suppliers.

Again, there are two socially effective variants: conformity of interests of enterprises either in the production by the enterprise or in the delivery by the supplier. The enforcement of the interests of the enterprise results sometimes in restriction on non-lucrative cooperation, but in other instances in expanded efficient cooperation. Therefore, the rather widespread view that the interest in AVA automatically leads to restrictions on cooperation is incorrect. That is the case only if it is advantageous for the enterprise in terms of wages (or costs).

However, here again are two types of instances when the interests of both partners deviate, the usual consequence being the selection of a variant which is advantageous to one of them, but which frequently means a disadvantage to the public.

The interest of AVA, or rather, in reducing the share of wages in AVA, becomes evident in decisions concerning the range of products. Differences (often considerable) in wage demands--measured by the share of wages in AVA--necessarily exist between products (outputs). Naturally, the enterprise is interested in expanding its production of goods with below-average wage demands and in curtailing the production of other goods with below-average wages. Without closer examination it cannot be said that here the interests of the enterprise always clash with public interests. If the enterprise expands the production which is advantageous in terms of wages and also necessary for the public, AVA positively affects the satisfaction of public needs, must as in the opposite case restrictions of the production which is disadvantageous in terms of wages and undesirable for the public produce a favorable effect. Nevertheless, the effect of AVA is disadvantageous if the enterprise expands a production which is lucrative for the enterprise but of little use for society (thus, the enterprise runs into difficulties with marketing and its unmarketable finished goods are stockpiled), and conversely--and particularly--if the enterprise curtails socially desirable, even essential production which demands above-average wages.

Problems of innovation and technical development go hand in hand with the assortment of goods. New products and new technologies with below-average wage demands (here we stress again: from the point of view of a given manufacturer) are very attractive for the enterprise, and AVA supports their introduction. On the other hand, when products and technologies with above-average demands are introduced into production, wage problems develop, because the enterprise cannot cover higher wage demands for such a production from wages payable which are limited by wage standards--unless wage standards have already foreseen higher wage demands of new products and new technologies. Interests in the amount of AVA may therefore stimulate as well as hamper--even prevent--the introduction of new goods and new technologies, i.e., implementation of R&D.

Other examples of the positive and occasionally also of the negative effect of AVA, due to its use in curbing the wage development, may be quoted. Let us focus our attention, for instance, on rationalization programs. We shall proceed from the premise that they cut labor input, which lowers wage demands--thus, the enterprise obtains additional wages payable in the full amount of the savings. The outcome is the same when costs of materials are cut by rationalization programs: savings increase AVA and wages payable by the same amount, however, multiplied by the wage standard (for example, Kcs 100 saved in material consumption raises wages payable by Kcs 40, if the standard is set at 40 percent). Consequently, AVA exerts far more intensive pressures on savings on wages (labor input) than on savings of material costs and services of the nonmaterial type (and after 1985, also of interest). For that reason, production factors (value added and past labor input) are not interchangeable.

When combining wages and costs of materials, savings of material costs may be determined in some cases by the outlay of higher wages, as illustrated by the following example: savings of materials amounting to 100 increase AVA by the same amount, which in our case raises wages payable by 40; up to that amount it is advantageous for the enterprise to implement rationalization programs. However, if outlays of wages higher than 40, for instance, 55, are necessary to save the above-mentioned materials in the amount of 100, the enterprise would lose an amount equal to 55 - 40 = 15 in wages; an enterprise that would introduce such a rationalization program would encounter problems in the wage sector, although in terms of costs and profits this rationalization is very appealing for the enterprise (costs are cut by 100 - 55 = 45, profits increase by the same amount, and profitability is up).

The trend aimed at improving the quality of goods is increasingly emphatically enforced in all of our national economy. It is therefore appropriate to ask whether--and how--is this trend encouraged by the application of AVA in the management, especially in controlling the wage development. Prices have an important role here--higher for a good product, lower for an inferior product. Thus, of particular importance is premium pricing of technically advanced products and top quality goods, which should increase the share of products of AVA--at least in the transitional period during which this preferential treatment is applicable--and thereby reduce the share of wages in those outputs. Analogically--of course, in the opposite direction--this applies to penalties for technically obsolescent goods and third-rate products.

We shall use another illustration to answer the above question: The enterprise obtains an amount equal to 100 for a better quality product; thereby its wages payable are increased by 40. If the improvement of quality is determined by payments of higher wages, the enterprise is interested from the point of view of wages in the production of an improved product, if the required wage increase is less than 40--and more so if the wage increase is less than that; the difference up to 40 represents premium wages. However, if the improvement of the quality of the product calls for wages in an amount higher than 40, the enterprise will have problems with wages, because it has no compensation for wages amounting to more than 40. It is then logical that the enterprise will not accept the production of goods of better quality, until it succeeds in achieving--by rationalization programs, price negotiations and other measures (adjustment of wage standards, etc.)--a concession saving it from footing the wages for better quality.

There is no need to repeat that we are solving problems in a narrow sense of wages. In reality many other factors, for example, profitability of production assets, the opportunity to increase sales in domestic markets and especially abroad, etc., affect the enterprise's decisionmaking.

We could offer additional examples where the interests of the enterprise which are focused with priority on the acquisition of necessary wages payable, agree or, conversely, disagree with public interests. This involves, for instance, replacement of materials or energy connected with wage demands, purchase of tools and other needs within the enterprise or from outside sources, transportation by the enterprise's own or outside vehicles, outputs of computer technology produced by the enterprise or by contractors, etc.

Ramifications of Changes Scheduled for the Beginning of Next 5-Year Plan

Having excluded interest from AVA as of 1 January 1986, the volume of AVA will be reduced and therefore, standard rates for wages payable will increase. In the same direction, and even more intensively, follows the effect of the cancellation of the incentive wage factor and its linkage with the currently applied basic factor. These changes will also affect our considerations, but from the quantitative, rather than qualitative, point of view.

1. Where we considered the substitution of two production factors--value added (wages) and past labor input (cost of materials), the interests of the enterprise and of the public will become closer in the future, as confirmed by the following example: in the above-mentioned case the rationalization program was advantageous for the enterprise only in that case when the required wages were less than 40; if the wage standard increases as of 1 January 1986, for instance, to 52 (i.e., by 30 percent), even measures that call for wages up to 52 will be in favor of the enterprise.

2. Higher standard rates cannot change a thing in the relations of wage of individual products, but the absolute difference betwen then will increase. If the difference in wage demands between product A and product B is, for example, 44 and 34 = 10, then after the 30 percent increase in the standards

it will be 57.2 and 44.2 = 13. Thus, AVA will affect even more intensively the selection of the assortment of products, innovations, technical development, quality of goods, etc., both in the positive and in the negative sense.

Conclusion

Without any doubt the enforcement of AVA in our management system represents a dramatic step toward more efficient economic operations, including control of wages payable, by intensive pressures on material costs (except for depreciations), on services of the nonmaterial type, and in the future, also on interest. Furthermore, AVA exerts an overwhelming positive effect on decisionmaking in enterprises, if the solution has several variants and if the variant which expresses conformity of interests of the enterprise and of the public is selected.

By the same token, we realize that there is no indicator applicable in our management system, especially in the sector of material incentives, that would not result in unwanted, undesirable, even socially harmful consequences in specific conditions; the same applies to the use of AVA. Again, when using this indicator in our management system, products are divided into those which are profitable for the enterprise and those which are unprofitable--and the range of profitability and unprofitability is the wider, the narrower the delimitation of the contents of AVA.

The objective of our contribution was precisely to use the example of repairs and other economic operations in order to call attention to potential adverse consequences of the application of AVA in terms of wages payable, to help identify these hazards, and to recommend the application of additional measures to reduce to a minimum the risks stemming from the use of AVA, so much more so because with the exclusion of interest from AVA as of 1 January 1986 and after the cancellation of the incentive wage factor new problems will arise, some of them of a positive nature (narrowing of differences in the evaluation of production factors and their substitution) and some negative (greater differences between products in the wage demand indicator gauged by the share of wages in AVA of goods).

GEORGI INTERVIEWED ON MACHINE TOOL INDUSTRY AUTOMATION PLANS

East Berlin NEUES DEUTSCHLAND in German 10 Jan 86 p 3

[Interview with Dr Rudi Georgi, minister for machine tool and processing machinery construction, by Dieter Brueckner; date and place not given]

[Text] NEUES DEUTSCHLAND: The machine tool and processing machinery industry has, once more, achieved double-digit growth rates for 1985. Congratulations, minister. One can surely approach new tasks in good spirits?

Dr Georgi: The congratulations belong to the 137,000 workers in our 6 combines. It is due to their diligence and skills that our industry fulfilled and exceeded the plan. With respect to net production, we achieved a 10-percent growth, productivity rose 9.8 percent, and there were 11.1 percent more finished products for the population. Significant increases were also achieved by our export efforts, both with respect to the Soviet Union and the other socialist countries and to capitalist nations as well. The combines in our jurisdiction produced around DM 1 billion worth of consumer goods, including supplies for other jurisdictions producing consumer goods.

Daily Performance Raised to 1.5 Plus in Honor of the 11th Party Congress

As pleasant as the figures are, we have no reason or time to bask for long in the successes of yesterday. We do not overlook the fact that the share accounted for by the combines and enterprises in the total good results was quite variable. Many an item can be made better here. The 11th party congress is coming and we wish to record even better results. The pledges made at the Zeiss Combine set the yardstick for our collectives in terms of preparations for the 11th party congress.

NEUES DEUTSCHLAND: The 1986 plan indicates that your industrial area, second only to the electrotechnical and electronics industry, is expected to negotiate the steepest performance curves. Net production and labor productivity are expected to once more rise by 10 percent. This gives the international competition something to think about....

Dr Georgi: It will not be very easy, but, after all, we are in the year of the party congress and, on top of everything, we are at the beginning of a new 5-year planning period. Our performance during 1986 will determine the starting positions for the next phase of development in our country decisively, a development which the party congress will lay out. This is why the collectives in the combines consider the above-named plan figures to be minimum requirements. Efforts in socialist competition, following thorough discussion are aimed at fulfilling 25 percent of the annual plan by 31 March and at attaining 1.5 daily production performances by the time the party congress is held as well. Naturally, this requires optimum work performance every day.

The Trend: Flexible Automation

NEUES DEUTSCHLAND: The machine tool industry has to fulfill a double function. It is an important partner with respect to rationalization in many of our combines and, at the same time, the main support of exports from the republic. In addition to the requirement to supply ever more machines and installations, the industry is faced with ever increasing quality demands.

Dr Georgi: That is true. The more consistently our industry treads the path of comprehensive intensification, as it was once more precisely outlined by the 10th and 11th Congresses of the Central Committee, the more rationalization is undertaken and the more the modernization of available equipment is done to make it into the principal form of expanded reproduction of capital assets, the more do the quantitative and primarily qualitative requirements levied on the machine tool and processing machinery industry tend to grow. The developmental trend in the metal processing industry is clearly in the direction of automation. Automation determines the features, primarily the productivity and working and living conditions of the workers in the factories of tomorrow. This is so internationally and, naturally, is applicable in our country, too.

The machine tool industry can undertake its dual function only if it offers, through its products, highly productive solutions for flexibly automated manufacturing processes. I don't wish to anticipate, but the Leipzig Spring Fair of 1986, but even more so the activation of important rationalization procedures prior to the 11th party congress, will show the performance standards which are inherent in the GDR machine tool industry. Here, we are specifically talking about facilities which make it possible to increase productivity to 500 or 600 percent!

NEUES DEUTSCHLAND: Where do we stand internationally, comrade minister?

Dr Georgi: Despite intensified competition conditions in foreign markets, our machine tool industry ranks third in international exports and sixth in the world in terms of production.

NEUES DEUTSCHLAND: Yet the competition is not asleep and it is precisely because of the increasing degree to which traditional machinebuilding is being combined with microelectronics and computer technology a particularly high rate of production renewal is being demanded. What can you tell us about this development?

Dr Georgi: During the last decade, but particularly during the past 2 years, scientific-technical development in our area has advanced at breakneck speed.

The trend toward automation cannot be overlooked. This is combined with the requirement that manufacturing technology must today not only be capable of high performance and reliability, but must, to a great extent, be applicable on a flexible basis because producers want to be in a position, even while they are automatically manufacturing one product, to use the same technology just as rationally and productively in manufacturing a new product.

Thus, for example, on an international scale the availability of processing centers for flexible automation--they represent a particularly highly efficient and highly productive technical solution for various processing operations involving a piece of work--has increased around 58 percent over the past 5 years. Naturally, this would not have been possible had not microelectronics become a natural component of machines and if industrial robots had not become the extremities of such manufacturing systems. And finally, let us refer to virtually revolutionary changes which have been brought about by CAD/CAM (computer-assisted design and computer-assisted manufacture). Even this is an essential part of the road toward the automated factory in the next 10 to 15 years.

The Tempo of Innovation Is To Increase

NEUES DEUTSCHLAND: What consequences result from this for the innovation process?

Dr Georgi: The matter is clear. The combines of the machine tool industry currently have a renewal rate of 32 percent, the Polygraph Combine has a rate of 36.5 percent, and the TEXTIMA Combine almost attained a rate of 30 percent. This innovation rate must be maintained and increased. Otherwise, one cannot keep pace internationally. Yet we must master an important problem: the economic utilization of results produced by science and technology must improve.

NEUES DEUTSCHLAND: What do you mean by that?

Dr Georgi: It still takes too long for new developments from research or from design offices to find their way into production and to be rationally manufactured following a short start-up curve. The comprehensive intensification of the entire reproduction process, the creation of modern technologies is a decisive focal point in the competition for realizing our economic strategy. We have sufficient experience and all the necessary prerequisites in order to master this. The ideological work in all collectives must also be concentrated in this direction.

NEUES DEUTSCHLAND: In other words, the producers of the most modern technology for rationalization are orienting themselves even stronger than before to rationalize things "in their own house"?

Dr Georgi: There is no more effective possibility which corresponds to our conditions for utilizing scientific-technical progress and for creating all prerequisites for being able to produce more and better machines with the same number of workers over the same period of time and also constantly improving working and living conditions. We shall apply our own CAD/CAM solutions increasingly, we shall significantly expand our own rationalization movement, and we shall forge the alliance between the combines and science more closely than heretofore on a contractual basis.

Difficult Requirements for Every New Development

NEUES DEUTSCHLAND: You have already spoken of the qualitative changes in technology. Conventional machine tools are being increasingly replaced by processing centers and by numerically controlled or computer-controlled machines. These, in turn, can be upgraded all the way to a flexible automated production line or system. What technical and economic performance roles must, therefore, be set for new developments even as early as the time at which the duties and specifications are determined?

Dr Georgi: Our collectives--and I repeat--are meeting the challenge of the scientific-technical revolution. And we can reap our own advantages in this respect--the socialist planned economy, our clear economic strategy, organization of production on the basis of high-performance combines with high-quality workers. And as far as the process of renewal and prescribed duties are concerned, clear odds are given in the area:

a) the use value of every new part must be 50 percent greater than its predecessor;

b) the specific materials use must be 20 to 40 percent less, the mass-performance ratio must be, on average, about 35 percent more favorable;

c) the producer must be able to show a worktime savings of 30 to 40 percent with regard to the new product;

d) we expect each new development to result in a decline in specific energy use by 15 to 20 percent.

Similarly precise determinations exist for additional qualitative characteristics of a new development, including specifics of anticipated foreign exchange earnings.

How 7 Marks Can Be Made Out of 1

NEUES DEUTSCHLAND: So, in competition the extent to which every collective takes economic utilization of the newest scientific and technical findings seriously is becoming measurable and controllable in competition?

Dr Georgi: That is precisely what is at stake. Naturally, these are only guidelines which will be given very specific form in the specifications book. But anyone who wants to stay below the set goals need not even apply. This is also true of other such goals. For example, we have derived a task from the economic strategy of the party and from international developments which calls for research work to be concluded in less than 24 months and, with respect to the majority of new products, the first series is expected to carry the "Q" quality designation; we also expect to file at least 10 to 15 patent applications per 100 advanced school or specialized school graduates.

For every mark expended on science and technology, we wish to derive a production volume of newly developed products worth 7 marks this year (in 1982 we were somewhere around 3.80 marks). More than half of the new production--even that is a decisive premise--we intend to export in order to make a decisive contribution to the growth of national income in this manner.

NEUES DEUTSCHLAND: What role is played by the application of microelectronics in the intensification strategy in your industry?

Dr Georgi: The key role. We want to and must achieve a status in the next few years whereby one-half of the industrial goods production from our industry will be equipped with microelectronic instruments, in other words microcomputers, microprocessors, semiconductor memory storage units, etc. In the case of metal-cutting machine tools for the processing of prismatic components the numbers will rise now from 83 to 90 percent, with respect to machine tools for sheet metal and more massive metal-forming processes the numbers will rise from 35 to 45 percent, and with respect to machines for the processing of rotation-symmetry components the numbers will rise from the current 56 percent to 80 percent.

NEUES DEUTSCHLAND: And where will the microelectronics come from?

Dr Georgi: From the combines of the electrotechnical and electronics industry and, increasingly, from our own enterprises. Together, we have made an early start on establishing our own basis for the development and production of microelectronic components, modules, and instruments. Think of the exemplary performance in the TEXTIMA Combine, involving their own "TEXTIMA-Electronic" devices or in the "Herbert Warnke" Metal-Forming Combine at Erfurt with their special "Erfurt-Electronic" operation. This domestic manufacture of controls, for example, corresponds to the standards which exist in worldwide developments.

If there was talk before of the good international position enjoyed by our machine tool industry, then this was due, not in last place, to the concentration upon our own high performance capacities for the production and application of microelectronics in the combines, which was demanded by our party. Incidentally, in this area we plan to achieve a growth rate of 30 percent this year.

CAD/CAM Helps To Win Over 1,000 Technologists

NEUES DEUTSCHLAND: One can surely draw conclusions from this that significant progress is planned in the application of CAD/CAM technology?

Dr Georgi: Without going into detail: yes, and actually very significant progress. The required intensification effects are not attainable any other way. Just with respect to the area of technological production preparation alone we are expecting to achieve effects in the coming period which would make it possible to increase the technological potential by at least 1,000 technologists. On balance, this is a mighty task. Because the qualification of thousands of workers must proceed at the same time as CAD/CAM technology is employed.

NEUES DEUTSCHLAND: Given the complicated nature of the tasks, does optimism prevail, comrade minister?

Dr Georgi: Yes, as far as I am concerned and in all collectives. I was once more able to convince myself of this during the days the new plan started up. Workers at the VEB Knitting Machine Plant at Karl-Marx-Stadt said to me, "We are setting ourselves such high goals because we are talking about our standard of living today and tomorrow and primarily we are talking about the fact that we can work and live in peace." And this attitude prevails throughout the industry. This is also why I am optimistic with respect to the fulfillment of our obligations in honor of the 11th party congress.

BRIEFS

STORM DAMAGES REPORTED--Berlin, 20 Jan (TANJUG)--Stormy winds, gusting up to 150 kilometers per hour, crossed the entire country on Sunday night. The fastest squalls reached hurricane force at more than 180 kilometers per hour over the top of the Harz Mountains. The violent wind was accompanied by much rain and isolated storms. Traffic had to be temporarily halted as of midnight in Rostock, Wismar, and Stralsund harbors. Damage to track and fallen trees led to obstructions, diversions, and delays in railway traffic over many routes, as for example on the stretches between Dresden and Leipzig, Dresden and Werdau, Magdeburg and Stendal, and on the Berlin outer ring. Stormy squalls caused breaks in overhead energy cables, for example in the areas of Schwerin, Suhl, and Neubrandenburg. This caused local energy supply disruptions. Repair teams are operating without interruption to rectify the damage done. [Text] [East Berlin ADN International Service in German 0558 GMT 20 Jan 86] /9604

SIGNIFICANCE, OPTIONS OF TRADE UNION ELECTIONS

Budapest NEPSZAVA in Hungarian 8 Oct 85 p 3

[Article by Ferenc Sz. Varnai, research fellow of the MSZMP CC: "Common Solidarity in the Interest of Trade Union Election Success"]

[Text] Those who consider the year 1985 to have special significance are probably not in error. On the anniversary of the liberation, recalling our recent history, we were able to consider the growth of four decades. And at our party's 13th congress the decisions were born looking ahead to our future goals, weighing our opportunities.

With Different Comprehension

However, the past and the future cannot make us forget the present. In fact, this year is also a test. Seven and a half million Hungarian citizens have voted in a new way, and a whole series of enterprises have begun operating under a changed enterprise management format. The social policy has imposed new requirements on the national economy: laying foundations for considerable increases in the standard of living, moderating the price increases, preventing any decrease in average real wages. And all this in a constantly changing global economic situation.

The year is also a test for the trade union movement. Inaccordance with its developed practice it is getting ready to make its report and elect officers which takes place every 5 years. Nearly 5 million trade union members including several hundred thousand communists will vote, giving their opinions about the trade union activities and officers, and suggesting ways to overcome the recognized difficulties.

Now the historical responsibility again urges the trade unions to implement the role they fulfill in society, to relay the justified criticism of the workers; yet at the same time they should gather their energies to reach the goals which appear with changed emphasis. New concepts or ones which were little used in the past must be explained, old ones reiterpreted, such as social security, full and effective employment, termination of enterprises, exchange rates, price spirals, and inflation rates.

All these were discussed also at these meetings of the county party organizations where the tasks of the communists relating to the trade union elections were considered. While honoring the independence and responsibility of the trade unions, it was discussed what help the party organs and organizations could provide at the work place and at the county level of organizing, the reporting, and electing officers.

Considering the Possibilities

One of these is political support. The attention of the communists has been alerted to the fact that the trade union elections cannot be viewed as "internal matter" of the movement, but that they are significant events in our society. These provide needed opportunities to explain our intentions of wanting to improve our situation, to deliver occasional criticism, and to offer help at least. This value is increased by our present economic situation and by the fact that we are laying down the foundations of another 5-year plan. This means not only the process of planning but also taking into account, how the level of work organization can be increased at the enterprises and at every individual place of work, how productivity can be increased, and how working time and material savings can be improved.

The answers cannot just be expected from above. A significant portion of them can be answered with the cooperation of the working communities, the trade union membership, the stewards, the foremen, enterprise management and the enterprise's trade union organs. They can even be solved with the help of common concensus, based on the goals and the jobs to be done.

Well Considered Answers

The other form of help is to call attention. The experiences of preparation before the party congress and also what was heard at the party congress warn us about certain tensions that are to be expected. These may trigger impatience, influence the atmosphere of the trade union elections. That the standard of living is decreasing for some groups as does the real value of retirement pay were mentioned as such factors at the party organization meetings. Setting up a home continues to be difficult.

Arguments are triggered by the significant differences between earnings gained during the main working hours and outside of them, the population's supply of heating materials, the problems connected with energy limitations at the beginning of the year, the price changes of recent years, and the activities of commence. It can be expected that the questions concerning vacations, social policies, taxation and retirement systems will be asked again. It may come up with reference to calculating the sick leave pay why the earnings are not uniformly taken into consideration, for example, in paying the reimbursements, and in calculating the membership fees. All these are familier, but to give convincing answers to them requires preparation and consideration of the reasons--which gives selfconfidence--in advance and with forethough, rather than improvising at the voters' meeting or by repeating slogans.

It will probably be much more difficult to answer questions which concern evaluation of our present situation. Even among those the question of where the Hungarian national economy is today, in 1985, at the starting point of the Seventh 5-Year Plan, is of fundamental significance which affects every workplace and worker. There are optimistic views, according to which there is no reason to worry, since we have gotten over the difficult part of it, we have closed the process of consolidation, and there are no obstacles to the development. In the meanwhile others predict on the basis of the unfavorable experiences of fulfilling the 1985 plan so far that implementation of the goals accepted at the 13th party congress is in danger, and thus we are unable to satisfy the accepted social policy obligations. It is necessary for the trade union organs to take a sober, well-founded position, free of extremes and illusions, which can impartially show the real need for action, which can provide also a social and economic program to the membership--emphasized those who commented at the party organization meetings. We must not expect miracles, but if we know the difficulties and have mutual confidence and share responsibilities, together we can find the opportunities for progress at every level of production.

At the county party organization meetings attention was called to the fact that it is also advisable to protect our interests in this knowledge. It is possible that submitting the wage and price policy measures and various wish lists compiled without taking into consideration the objective limitations posed by the economic situation, demanding that they be fulfilled, and rejecting compromises, could perhaps momentarily be popular, yet they would not help, indeed they might hamper progress and the solving of the real problems. This is why it will be important to react in a circumspect manner, soberly weighing the possibilities and at the same time maintaining the respect for the organized labor movement. To decide what the trade union organs will accept as justified demands, what they consider possible to fulfill, to what they lend their name, and which ones will be those which--with acceptable reasoning--they reject. Of course, this does not mean that the imagined and real concerns should be kept quiet. Naturally every concern, request and proposal of the workers has a place at the voters' conferences. Nobody can hope to restrict these, since listening to the observations strengthens the confidence and helps discover the source of conflicts. The party organs have merely emphasized the responsibility of "providing the answers." That it should be the decisive principle for the viewpoints: the wages, prices and incomes must be weighed only by relating them to the results of production.

About the Work Done

It has been suggested that this should also be one of the basic thoughts of the workplace reports of the trade union organs. That is, it should be illustrated how the enterprise's production results in the last 5-year-plan cycle laid down the foundations for the workers' income and its social policy, what the prospects and plans for the next 5 years are. Furthermore, this must be discussed due to the fact that the evaluation of the trade union work--experience shows this--depends largely on the profits of the enterprise.

It is not necessary, they emphasized, that the trade union organs provide itemized, inventory-like reports on the work done, including the activity of the communists in it. Rather, they should evaluate the results of their decisions, implementations of their selected goals, and consequently the membership cooperation. All this should be viewed together with the given possibilities of the 5 years, comparing and measuring them in this context.

The party organizations mentioned that the organizational changes--such as, for example, changes in some county committees, modifications in the trade union county council structures--can simplify the movement's work, free it of some stages. But care must be taken that the reorganizations do not distract attention from preparation of the content, from formulating what is to be said, from looking ahead, or the ideas concerning the future. And now, all the way until the 25th congress of the Hungarian trade unions this is the next stage--they emphasized.

At the party organization meetings the invited trade union officials provided information--in addition to the organizational and content preparation of the elections--on personnel conditions. According to the preliminary indications the turnover of officials will be somewhat higher than in 1980. The performance of trade union work--as is commonly known--is not among the very easy tasks. Significant turnover can be expected especially among the stewards, which in some counties according to the estimates may even approach 50 percent. One of the important reasons for this is that there is no desire to reelect those who have proven unsuitable. But the movement needs those who have done their jobs to the membership's satisfaction, they must be convinced to accept the office.

Not by the Authority's Word

In theory, the elections provide an opportunity to solve any cadre problems. It is uniformly believed that the requirements of the trade union movement call for a definite cadre policy. This also means that the necessary compromises should not unnecessarily harm the movement under the guise of dangerous false humanism.

A close relationship can be demonstrated between the success of the enterprise operation and acceptance of office. Where there is a problem it is difficult to develop the appropriate proposal. The general experience is that greater effort is needed to have the right number of young people and workers among the candidates. We must work hard to convince some of the intellectuals to accept offices. But the number of those involved is increasing. The reasons for all this were also analyzed in the party organization debates.

How should the party's influence materialize in the cadre work? It is the obligation of every party member to have an opinion and to fight for it to prevail. But not by the authority's word, not from position, by mechanical interpretation of the areas of authority but rather by convincing, with the aid of logical and well-founded reasonsing. And where things still do no happen the way they were proposed, the reasons for the trade union membership decisions must be analyzed, to determine their logic reasoning.

Naturally, it is not yet possible to summarize all the experiences of preparation and assistance given to the elections of the trade unions and the help given to them. What we know and are familiar with is reassuring. The cooperation is good; the solid foundation for this is the MSZMP CC [Hungarian Socialist Workers Party Central Committee] position of 12 October 1983 concerning the development of the trade union work and the party tasks, plus the resolution of the 13th party congress. It proves that our party at all levels relies on the trade unions, considers them helpmates and needs their participation in working out the policies, getting them accepted and implemented. And the party organizations and the communists--by giving their opinions in the important questions of political significance, by avoiding the interference of going into details--are helping the trade unions also in the counties so that they can fulfill their calling by joint cooperation based on commitment, yet by independent action.

VICE-MINISTER ON NEW FINANCIAL INCENTIVES FOR INDUSTRY

Warsaw RZECZPOSPOLITA in Polish 11 Nov 85 pp 1, 2

[Vice-minister of Finances Bronislaw Cias interviewed by Janusz Kotarski]

[Text] The government presidium has accepted a package of executive rules which constitute a continuation of the changes which the law of 31 July 1985 began in system of reform policies. Part of these rules directly affect the financing of enterprises. On this subject a PAP journalist spoke with Vice-Minister for Finances Bronislaw Cias.

[Question] Increased efficiency, savings, broader application of technical progress are only a few of the desirable forms of behavior for enterprises. Will the new rules in the economic-financial system encourage such behavior, and if so, to what extent?

[Answer] Motivating enterprises to apply scientific-technical progress, introduce innovations, save production factors and limiting the negative influence of their activities on the natural environment are the main reasons for the change in the guidelines for charging income taxes. This is an integrated system of incentives. Thus, the income tax breaks will be used to encourage scientific-technical progress in government contracts. Investments of this type, with a cycle of less than 5 years, will reduce income taxes by an amount equal to 30 percent of the expenditures incurred. Similar relief will be granted for the introduction of Polish inventions in production. It is worth adding that all the above-mentioned incentives are not subject to the rule according to which the total amount of reductions in income tax may not be more than twenty percent of profits.

[Question] But not all enterprises can get government contracts, or undertake the sometimes costly introduction of Polish inventions into production processes.

[Answer] Of course. But this is special treatment and significant preferences for innovations of particular importance for the economy. On the other hand there is a general need for the whole process of incentives; both inventors and those who put their inventions to use have a particular interest in this. The first function is already fulfilled by the principle that profits made for the first 3 years from the introduction of the innovation and due to it are exempt from taxes. A greater incentive for inventors is the "Fund of Innovation Results" which was created last year. Enterprises will put into this fund an amount which represents the economic effect or result of the innovation (up to ten percent of the profits derived therefrom in the first year of the innovation, and eight and six percent for the next 2 years). This deduction is made before taxes, which represents a substantial preference. The Fund of Innovation Results will be intended for the authors of inventions, both within and outside the enterprise. By this means we want to provide an incentive for workers at scientific research institutes for the rapid realization of their ideas and to concentrate on research with a potential for such innovations. This linkage is especially important and should reduce the number of inventions which simply sit on the shelves.

Among the incentives for economy, aside from existing tax breaks for reducing raw material consumption, income tax breaks for more efficient use of electricity and fuels is a novelty. Its implementation would, however, require establishment of consumption norms. Their preparation has been undertaken by the Main Inspectorate for Energy Management. This incentive could reach 50 percent of the value of energy saved. The benefit is, in a way, twofold. Reducing consumption generally reduces costs, and thus increases profits, and the tax break significantly reduce the incidence of taxes on those profits.

[Question] One of the decisive factors in economic stabilization is increased exports. This is the only way to enable us to import raw and other materials and the only way to really get out of debt. Do the new rules give increased preference to export production?

[Answer] Of course, and in a far-reaching way. The changes emphasize primarily an increase in income tax breaks of up to eight percent of the value of export. I repeat, the value of export, and not the profits made therefrom. Thus the large tax breaks will benefit those enterprises which sell goods abroad that is highly finished goods, or enterprises which export to countries on a list drawn up by the Minister of Foreign Trade.

Exports of semifinished goods will in turn will get benefits of six percent of value of export, under the condition of directed sale, as before.

On the other hand, less preference will be given next year to exports of raw materials and centrally accounted materials, i.e. those needed in Poland. Here the benefits amount to two percent of the value of export.

Another important innovation is the possibility of transferring part of the tax savings due to exports to cooperative development funds. We have adopted the general guideline that tax savings from exports can only go to the development funds, or other, similar funds. This is to promote the development of export production. Hence also the tax incentives for investments aimed at increasing exports. They amount to 20 percent of investment costs. Starting next year they will be applied to investments with a 5-year term, i.e. 2 years longer than under previous rules. On the other hand, there has been a slight reduction of preferences for increased exports. But they have been maintained and amount to 15 percent of the value of the increase in exports of highly finished goods sold to designated countries, and five percent of the increase in exports to other countries.

I should also point out another rather important change. When the general increase in benefits for exports was instituted, the size of those benefits was tied to profitability. For unprofitable exports the benefits will be correspondingly reduced.

[Question] You mentioned the possibility of transferring funds from export tax benefits to help cooperative enterprises. As is known, this is not the only innovation promoting closer cooperation among enterprises. The law of 31 July also provides for the authorization for enterprises to issue bonds. Has this matter also been given detailed regulations?

[Answer] Yes. The relevant decree of the Council of Ministers has already been prepared. The right to issue bonds will be given to state enterprises when they define the purpose for which the funds will be spent and when the proposed issue is approved by the Minister of Finances. It is essential that the enterprise's goals coincide with those of the economy as a whole. On the other hand, the bonds may be purchased by any publicly owned economic unit, especially one which would directly benefit from the project being carried out by the issuer of the bonds. Purchase of the bonds guarantees receipt of interest, accumulated from the development fund of the bond purchaser and tax free. But the bond may involve other obligations of the issuer, e.g. a guarantee to increase cooperative deliveries, introducing a new line of goods, etc. All the conditions stipulated by the bond must be fulfilled, or the issuer must immediately buy back the bond. This is an important factor introducing discipline into relations between enterprises, which places on the issuer much greater responsibility for scrupulous fulfillment of commitments undertaken partly at other parties' expense. The issuing enterprise would back the bonds with its assets, and collection of the sum due would take place according to the normal procedure.

[Question] Will the new rules be able to introduce greater discipline in enterprise finance? Much has been said about the failure of the "tight money policy", the blame being placed for example, on shortcomings in the system, or in an excessively broad scope for discretionary incentives.

[Answer] It seems that changes in the economic-financial system more clearly define the areas of preference and provide greater opportunities for enterprises which try to be more efficient and up-to-date. Attracting investments is also important here. This should reduce the often justified emphasis on granting individual incentives. Now they can be gotten in a universally binding system. This is also why we want to treat individual incentives next year as quite exceptional. However, I wouldn't want to prejudge the elimination of this item. It can remain, although, as I think, on a much smaller scale. This will make it possible to increase the role of the banks and credit through the "tight money policy."

BAKA, NIECKARZ ADDRESS QUESTIONS AT SEJM PLENARY SESSION

Warsaw RZECZPOSPOLITA in Polish 28 Nov 85 p 4

[Excerpts] Wladyslaw Baka addressed the question raised in the discussion on how the bank could influence enterprises which pollute the environment. Since, as he recalled, in addition to operating costs of enterprises there are the fines paid for polluting the environment, and the amounts of those fines are increasing, it would seem that the creditworthiness of such an enterprise would be threatened, and we all know what that means. The relevant directives will also stipulate that the banks must not allocate credit for investment without a favorable ruling from the organs responsible for water and natural resources. The bill on monetary and credit policy submitted to the Sejm included a provision forcing banks to give preference in credit to projects aimed at improving environmental protection.

On the results of the planned creation of a community of iron and steel mills, Minister Stanislaw Neickarz said that that proposal is still being discussed. It is not directly related to allocations for the metallurgy branch. The need to subsidize the metallurgy industry comes from support of production from outmoded plants and new plants which pay a high percentage of the prices for finished goods. Official prices for metal products at present do not cover costs, yet raising them all at once would cause considerable price increases for finished goods.

The minister discussed changes in income taxes for the private sector, adjusted for inflation. Tax policy, as he said, is aimed primarily at increasing the production of goods and services. From this point of view the ministry is analysing the profitability of that sector in a timely manner; e.g. taking into account the process of inflation for this year income taxes for individuals outside the agricultural sector have been ajusted.

Presenting the systemic and organizational policies which would ensure the funds for carrying out the program of improvement, S. Nieckarz said that that is a matter for the provincial people's councils. If the appropriate expenditures are not allocated in some provinces, then the government would support that province with funds from national reserves. In general the provincial councils have so far not given enough attention to improvement, allocating insufficient funds for it.

The minister also dealt with the question of provision of funds in the provisional budget for farm price supports. As he recalled, at present the general guiding principle is that prices are formed in a triad: cost prices, procurement prices and retail prices. This has been affirmed, for example, by decisions of the PZPR Central Committee, and the United Peasant Party Chief Committee without prejudice to the relevant sums of money. The specific sums of present profitability will be known by spring. The appropriate decisions will then be made.

S. Nieckarz also presented the problem of profitability in the agri-food industry and systemic solutions affecting investments. If profits are equal to overall production costs, the profitability of this industry is substantially lower than the average for the economy as a whole. But it should be remembered that this industry is characterized by processing costs, i.e. for raw and semifinished material processing. The minister affirmed that the present financial and administrative system is adequate for concentrating and redistributing funds among branches. Taking advantage of existing rules depends upon the initiative of enterprises.

POLISH REACTION TO 41ST GATT SESSION

Warsaw ZYCIE WARSZAWY in Polish 30 Nov-1 Dec 85 p 4

[Article by (P): "Conclusion of 41st GATT Session"]

[Text] Geneva (PAP)--PAP correspondent, Edward Dylawerski, writes: "The 41st session of the signatory nations to the general agreement on tariffs and trade (GATT) concluded on Thursday with a decision to form a committee which will concern itself with preparing a new round of multilateral negotiations aimed at liberalizing world trade".

The committee has until the middle of July of 1986 to prepare proposals concerning the organization of the new GATT round of negotiations. In September of 1986, the conference of 90 nations--signatories to the GATT at the ministers level should already officially make a decision about commencing multilateral talks.

According to the director general of GATT, Arthur Dunkel, these talks will be the most comprehensive ever because the number of GATT signatories has increased from the last round of talks and great changes have taken place in the world. The chairman of the 41st session, Felipe Jaramillo (Colombia), believes that the future of the general agreement on tariffs and trade signed in 1949 depends on the progress of the new round of negotiations.

In assessing the proceedings of the session during a conversation with the PAP correspondent, Boguslaw Sosnowski, chairman of the Polish delegation taking part in the 41st session of GATT and director of the department of international economic organizations at MHZ, said that compromise in the matter of creating a preparatory committee signifies that all GATT signatories--developed and developing countires as well as socialist countries perceive the danger related to the creeping in of protectionism in world trade. This is why the preparatory committee, which all GATT signatories may join, was appointed. The committee is to define the topic range, the method of negotiating and the participation of nations in this new round.

It was decided that the committee will present its recommendations at the ministerial session in September of the coming year. This means that the majority of controversial issues have not been settled and that policy decisions at the ministerial level will be required. This particularly concerns issues pertaining to the elimination of obstacles in world trade, preferential treatment of developing countries and including services on the agenda of the coming rounds of negotiations.

"All of these matters," said Director Sosnowski," as well as many others, such as trade with agricultural products, methods of settling disputes and the use of protectionist clauses, are very important to Polish international trade and, consequently, to the Polish economy. In connection with this, we intend to actively participate in the work of the preparatory committee. The decision of GATT to create this committee is important to our economy in that the commencement of the very important and difficult round of trade negotiations will probably fall during the period of our next 5-year plan and the further application of the assumption of our economic reform which coincide with the directions of the work of GATT."

INCREASED IMPORTS OF CONSUMER GOODS

Warsaw ZYCIE WARSZAWY in Polish 2 Dec 85 pp 1, 2

[Article by (Krys.): "Increased Imports for the Needs of the Consumer Goods Market"]

[Text] (Own information). We have purchased all sorts of goods abroad the deliveries of which are concentrated toward the end of the year. This applies both to food goods (e.g., coffee, tea, spices) and also to manufactured products which constitute a supplementation of enrichment of the all too small--in relation to the need--domestic selection.

During the current year [1985], we will have imported a total of 35,000 tons of tea, thus, 10,000 tons more than last year. Tea has become our favorite beverage and in terms of its consumption per person, we find ourselves in the forefront in the world. The largest deliveries occur during the fourth quarter.

Unfortunately, because of the shortage of foreign exchange, we should not expect to see Indian tea. However, for coffee lovers there is good news because considerable amounts of this beverage will be available in stores toward the end of this year. Trade representatives claim that there should not be any problems with obtaining it [coffee]. However, one can never tell because deliveries during the year were not systematic.

There will be somewhat more citrus fruits--a total of 30,000 tons. Mostly grapefruits have been imported. Their prices have even been lowered to encourage buying. Unfortunately, in this batch of citrus fruits, there are only small amounts of lemons (700 tons) and tangerines (900 tons). There will be enough only for the lucky few and for peddlers.

Shortly, there will be approximately 1,000 tons of raisins available in stores. They are already in the country but must be packaged. The same applies to gelatin, of which 180 tons have been imported. What is important is that it will be possible to buy items before the Holidays which have not been available in government-owned stores for so long, e.g., bay leaves, pepper, allspice, cloves, nutmeg and olive oil.

The constantly announced importing of various goods from China is becoming evident finally. For example, rice is being sold with a 20 percent discount because such large amounts have been bought. Deliveries of manufactured goods are flowing in again. However, because of their attractiveness as, for example, in the case of underwear, for the time being these articles have been disappearing immediately from store shelves. However, supplies will be so large that this should alleviate shortages considerably. We have purchased in this country [China] a lot of various items whose delivery is projected for the end of this and the beginning of next year. Thus, for example, 2.2 million pieces of terry cloth towels, 3 million sets of men's long underwear, just as many men's undershirts and warm underwear will be available in stores during this time.

In order to better illustrate the enormity of the deliveries, it should be mentioned that, for example, the import of warm underwear during the second half of this year is as large as our domestic production at that time whereas supplies of men's "unmentionables" even exceed domestic production. Deliveries of cottom underwear and garments for children and men's shirts are large. Robes, pajamas, bedding and ladies' and men's ready-to-wear clothing will be available in stores.

Of the household articles purchased in China, it is worth mentioning enamelware of which 600,000 pieces have been contracted for and should appear in stores any day now. Among them are: pots, mugs and bowls. In addition, 1 million pieces of stainless flatware prices competitively with Gerlach products were also purchased. There will also be all kinds of sports goods, toys for children, play moulding clay, crayons and pens available.

Toward the end of the year, supplies of mechanized equipment from the USSR, GDR and Czechoslovakia are larger than during the first three quarters. Thus, for example, supplies of refrigerators from the USSR (140,000 units) are during this, the fourth quarter, almost as large as the annual output from the Wroclaw based Polar (150,000 units). From China we have also imported color television sets (Rubin and Elektron).

Czechoslovakia will supply us with 15,000 juicers; 120,000 rotary washing machines will come from the GDR and a total of 100,000 units of automatic washing machines from Czechoslovakia and the USSR. According to some merchants, supplies of some imported goods will be so large that they should satisfy market demand.

PLANNING COMMISSION REVIEWS DRAFT BILLS ON INVESTMENTS

Warsaw ZYCIE WARSZAWY in Polish 2 Dec 85 pp 1, 2

[Text] (PAP) On 30 November, the Presidium of the Council of Ministers Planning Commission reviewed information along with the draft bills of the applicable resolutions of the Council of Ministers concerning:

—the results of investment verifications conducted in 1985 and the calculation of their value according to current prices as well as the approval of the verified cost estimate values, the effects and time-limits for turning them over as well as the sources of the financing of currently continued central investments;

—the establishment of procedural principles to be applied when managing assets arising from deferred investments whose implementation will not be resumed until the end of 1985;

—the defining of principles which are binding at the time of taking on heating investments in the field of professional power engineering and the sources of financing the aforementioned.

The verification of investments was combined with updating their cost estimate value based on the assessment of the cost of the actual extent of these investments still remaining to be implemented according to 1984 prices and projected prices until the end of their implementation. The above described work was conducted this year [1985] on the basis of the decisions of the Central Annual Plan for 1985 and was obligatory for all central investments and for other ventures with a cost estimate value exceeding 500 million zlotys financed with the participation of budgetary funds.

On the one hand, this work was aimed at limiting the factual range of these investments to proportions indispensable for achieving the projected effects and on the other hand, it was aimed at updating the assessment of the investment outlays still remaining to be implemented and the sources of their financing under conditions of the existing, systematic price increases on investment services and supplies.

A total of 785 investment ventures, whose current value according to projected prices is estimated at 4.5 billion [trillion] zlotys with the outlays remaining to be assumed at approximtely 3.2 billion [trillion] zlotys, were encompassed by the verification action.

The examined draft plan of the Council of Ministers resolution envisages the approval of the results of the verifications, individually for the specific central ventures and also the determining of the sources of their financing including also the sources of the repayment of bank credits.

In accordance with the currently proposed deadlines for the implementation of these investments, the majority of them will be completed during the coming 5-year period including 36 between 1986 and 1987. Following 1990, only 10 central investments from the current program will be continued.

The next problem to be examined by the Presidium of the Planning Commission was the matter of managing the assets remaining currently from suspended construction whose implementation has not been resumed. It should be stressed that of the total number of approximately 1,600 investments, which under conditions of necessary curtailments of the total proportions of investing were stopped after 1980, more than 400 tasks still await the decisions of investors with regard to the ways of managing or eliminating them.

The Presidium of the Planning Commission approved and decided to submit for consideration to the Council of Ministers the draft plan of the resolution which introduces significant privileges and incentives for investors in managing assets from suspended or abandoned investments.

In a subsequent point, the Planning Commission presidium examined the draft bill of the Council of Ministers resolution concerning the undertaking and financing of heat energy ventures in the professional power engineerng industry. This draft plan constitutes an indispensable and anticipated updating of the rules and regulation in this field which concerns mainly the annual and of many years standing planning of these investments as well as determining the proportions of the funds that ought to be appropriated for their financing from the particular sources. The principal directions of the draft plan, which in the very near future will be submitted to the Council of Ministers for consideration, were approved.

Members of management of interested ministries and institutions and of the NBP took part in the presidium meeting at which Vice-premier Manfred Gorywoda, chairman of the Planning Commission, presided.

PROVINCIAL ECONOMIC SECRETARIES CONFER

Warsaw TRYBUNA LUDU in Polish 2 Dec 85 p 2

[Article by Henryk Heller: "Party Responsibilities Toward the Economy"]

[Text] (Own Information) A conference of PZPR provincial committee economic secretaries was held in Poznan on 29 and 30 November under the chairmanship of Politburo member and KC Secretary Marian Wozniak. Politburo member Stanislaw Kalkus took part in the conference.

The subject of the deliberations included three topics:

--initiatives for the development of housing construction and lowering its costs;

--activity in the realm of improving the consumption of raw and other materials and energy as well as generating a movement of general economizing measures;

--the Central Annual Plan for 1986, the tools of its implementation and related tasks in party work.

Discussions pertaining to the problem matter of housing construction were preceded by visits paid by the conference participants to construction sites in Poznan. During the conference, tasks related to capital outlays and construction were formulated. The concentration of funds and technical means continues to be a fundamental problem on which the effectiveness of investment processes depends. Dispersion causes the extension of investment cycles and increased implementation costs. The next task, as stated in the discussion, is the lowering of costs at all stages of the investment process, from the drafting of plans, through their implementation and all the way to the operational phase.

In the discussion, the need for effectively combatting signs of uneconomicial management and wastefulness at construction sites was stressed. The implementation of pressing tasks in the construction industry will be possible only on condition that there will be evident progress in the area of economising in all production factors.

Jerzy Wozniak, minister of materials and fuel management, pointed out in his presentation the significance of economical management and the setting in motion of still existing reserves. He discussed the effects of the implementation of the economising program for 1983-1985 and presented the fundamental tasks for the next 5 years.

The assumption of the Central Annual Plan for 1986 and the instruments of its implementation were presented by Franciszek Kubiczek, first deputy chairman of the Council of Ministers Planning Commission. He pointed out in particular that the implementation of the plan, which is deeply rooted in the realities of our economy, depends on whether and to what extent enterprises will adapt themselves to the limited increase of raw and other materials and energy. This plain truth ought to be more widely established among management and among work forces.

In the discussion, problems of the optimum use of raw material and energy resources and of the production potential were raised and attention was called to the need for improving the functionalism of employment through, among other things, the elimination of administrative overgrowths and improving work organization. Specific examples were given of not taking into consideration the economic account in the making of economic decisions by enterprises. Furthermore, tasks for party elements and economic management boards geared toward combatting such practices were formulated.

It was pointed out that the key issue in the coming year will be a more complete balancing of the economy. The proper functioning of economic mechanisms will depend on this and as a result, an improvement in management efficiency.

Zygmunt Rybicki, the under secretary of state at the Office of the Council of Ministers, presented the principles of the functioning of government agencies in new organizations and the problems involved in the work of the state administration.

In summing up the conference, Politburo member and KC Secretary Marian Wozniak outlined the crucial tasks of party work in the economy in 1986 which will be the subject of deliberations and decisions of the 23d KC Plenum. He pointed out that raising management efficiency as a result of conserving energy, raw and other materials, the functional use of work resources, better tying in of remuneration to work results and activity for restoring financial-market equilibrium should all be the subject of constant work on the part of party echelons and organizations.

Progress in efficiency of management in 1986, thereby, the implementation of the social goals of the plan depends to a considerable degree on the effectiveness of party work in this field and on the commitment of party echelons and organizations.

MATERIALS MANAGEMENT, FUELS MINISTRY BUDGET PLAN DEBATED

Warsaw RZECZPOSPOLITA in Polish 4 Dec 85 p 4

[Article by (CH): "Economical Management Through the Prism of the Budget"]

[Text] The 5-year plan poses extremely difficult tasks in the field of efficient management. In order to achieve the envisaged growth rate, it is necessary that at least two-thirds of production growth have its source in raw material, fuel and energy conservation. This economic imperative dominated the discussion during the meeting of the Economic, Budget and Finance Plan Committee which on the 3d of this month, examined the budget draft plan for 1986 of the Ministry of Materials and Fuel Management. Less was said about the particular items in the budget and more about the tasks of the ministry and the methods of their implementation.

"The Ministry of Materials and Fuel Management as a functional ministry, became," acknowledged the Sejm delegates, "a veritable steerer of improvement in the efficiency of management after taking upon itself in 1985 the responsibility of concern for the functional use of the fixed assets of enterprises," The modifications to solutions of the economic reform, proposed for the coming 5-year period, serve to activate these processes. "However, it was stated in the joint report of the Sejm delegates, "the administrative methods of acting upon enterprises in the form of, among other things, bans on production issued by the ministry, are in conflict with the operating methods of the reform contained in the CPR [Central Annual Plan] for 1986." Minister Jerzy Wozniak debated this viewpoint claiming that both in the resolution of the Ninth PZPR Congress and in the legislative acts that expand it, the possibility of strengthening the action of the economic system by means of organizational solutions was allowed. The 156 bans on the production of goods which have been issued thus far represent an insignificant number in the presence of the 30,000 to 40,000 new products which reach the market during the year. "The bans do not hurt the independence of enterprises," added Minister J. Wozniak. "They are issued only when their [enterprise] activity harms the overall social good."

The delegates also took an active interest in the purchasing and management of secondary raw materials and expressed their approval of the program, prepared by the ministry and accepted by the Government Presidium, of developing the economy with secondary raw materials for the coming 5-year period.

After listening to explanations, the delegates accepted that part of the state budget draft plan for 1986 pertaining to the Ministry of Materials and Fuel Management. Draft plans of the budgets of the Central Office of Statistics and the Supreme Chamber of Control were also reviewed and passed.

The following delegates participated in the discussion presided over by delegate Jan Kaczmarek (PZPR): Jan Mieloch (no party affiliation PAX), Jerzy Szmajdzinski (PZPR), Cezary Wolf (PZPR), Bernard Widera (ZSL), Wieslaw Nadowski (PZPR), Wladyslaw Sz[illegible]amski (ZSL), Kazimierz Paszek (PZPR), Zbigniew Kubik (PZPR), Danuta Juzala (PZPR), Julian Bartkowski (PZBR), Albin Siekierski (PZPR), Zbigniew Gessner (SD), Stanislaw Stasiak (ZSL), Mieczyslaw Fracki (PZPR), Wincenty Lewandowski (no party affiliation), Bogdan Prus (PZPR), Mieczyslaw Budziewicz (ZSL), Aleksander Legatowicz (no party affiliation), Stanislaw Kielan (ZSL), Boleslaw Struzek (ZSL).

DECREE ISSUED ON NONNORMATIVE SALARY TAX RATES

Warsaw ZYCIE WARSZAWY in Polish 6 Dec 85 p 2

[Text] (PAP) The Council of Ministers has issued a decree regarding tax rates for nonnormative salaries and the principles of determining tax-free remuneration. The principles of determining this tax have been defined in a law amended on 31 July of this year [1985] regarding the taxing of socialized economic units.

The law prescribes that, as in the principles up to now governing PFAZ liability, the future tax will be paid from profits for distribution. The base salary will continue to be that which is free from taxation (PFAZ burden). In the case of a drop in production, it will be adjusted appropriately. Enterprises will be able to create a reserve for wages and payments made from this reserve will be free from tax. Tax credits due to the conservation of raw and other materials will be retained.

The basis for taxation will be amounts paid as wages which exceed the tax-free amount during the fiscal year and not increases in relation to the tax-free amount for the previous year above the determined index of increases free from PFAZ liabilities. As opposed to the PFAZ liabilities, the possibility of using gross production gauges has been eliminated, among other things, in the principles of setting the tax on nonnormative salaries. The gauge will be net sold production or net sales.

The methods of establishing tax reductions due to export production has been changed. The reductions will pertain to remuneration paid into the cost burden and not as had been the case up to now--rewards and bonuses paid from profits.

In the decree, various methods of determining the remuneration amounts paid into the tax-free cost burden were defined, among other things. The amount of the correction coefficient was set at 0.4. For certain kinds of activity, this coefficient will come to 1.0. Economic units, in which a drop in production will occur, will use a coefficient of 0.65 regardless of the coefficient used during an increase in production.

The range of decisions, which are discretionary in character, has been limited. The amount of tax-free rewards and bonuses paid out from profits has been made subject to changes in the profit amount. The tax will replensih the central budget and not the PFAZ. The complete text of the decree is being published in RZECZPOSPOLITA in its 6 December issue.

TRADE MINISTER VIEWS FLOW OF GOODS

AU301437 Warsaw RZECZPOSPOLITA in Polish 28 Jan 86 pp 1, 2

[Interview with Jerzy Jozwiak, minister of domestic trade and services, by "R.Rz.": "Better Supplies, More Effective Trade"; date and place not given]

[Excerpts] ["R.Rz."] Citizen Minister, what main tasks for trade have been mapped out by the 1986 central annual plan?

[Jozwiak] The 1986 central annual plan has created the necessary conditions to ensure that 1986 sees a further stabilization and consolidation of the flow of goods to shops. The main task of domestic trade is to exploit to the full these conditions, all the more so since the market situation is for consumers an important and even basic criterion for appraising the results of the performance of the economy as a whole.

A better flow of goods means better general conditions for increasing the requirements for the effectiveness of all activities. That is why trade must not waste any opportunity for normalizing the market situation.

["R.Rz."] What will the flow of goods to shops this year be?

[Jozwiak] Let me begin by saying that there should be no deterioration in the level of flow already achieved. What is more, if we accomplish the planned tasks, we should be able to achieve this year more distinct progress in restoring market balance. This progress will be especially visible in the flow of foodstuffs.

Except for meat, the supply of which continues to increase only to such an extent as to enable us to maintain the present level of meat rations for our ever-increasing population, all other staple foods such as flour, cereal products, sugar, fats, milk, and dairy products will fully meet our needs. If the market situation develops in line with our expectations, the rationing of fine groats and chocolate will be contemplated.

I have mentioned meat. Although our freedom to maneuver in this regard is still limited, we intend to crucially expand the free sales of smoked meat by-products and smoked products made from mutton, calf meat, and horse meat. We continue to evaluate the results of the experimental free sales of meat in three voivodships. If these results are encouraging, we will expand these sales.

["R.Rz."] Our people expect more tangible improvements in the organization and performance of domestic trade. Any comment?

[Jozwiak] We are fully aware of these expectations. Not so long ago my ministry studied the results of an analysis of almost 1,400 critical publications carried last year by the press on the subject of trade. These publications place the issue of the effective performance of trade on top of the list of issues. We know that people's expectations have increased and that they are often impatient, especially in the case of unjustified shortages of goods of which there should be no shortage. Their impatience also applies to the bad efficiency of some shops and to a lack of care for cleanliness and attractiveness. People blame the local trade organizations and the personnel of specific shops for these shortcomings, which are a result of bad organization and lack of responsibility and supervision. We will react to this resolutely in all cases warranting such reaction, but we will also bear in mind the honest, toilsome, and selfless work of a decisive majority of trade employees.

RULE CHANGES FOR FIRM HARD CURRENCY ACCOUNTS

Warsaw POLITKYA (POLITKYA EKSPORT IMPORT No 22 Supplement) in Polish
No 47, 23 Nov 85 p 15

[Article by Jan Siebeneichen, director, Studies and Planning Department, Ministry of Foreign Affairs: "A Cautious Step Forward"; passages in slantlines rendered in boldface in text]

[Text] The system of related foreign exchange earnings is now almost 4 years old. It includes (as of the end of September 1985) 2,264 production enterprises. Credits to retained-earnings accounts (individual and group) have reached $2,440 million, of which $1,758 million have been used.

The difference between credits and debits is used in import transactions assigned to foreign-trade enterprises. This sum also includes funds set aside by the account holders to cover purchases for developing the enterprises. Imports within the retained-earnings system constitute about 14 percent of those from the second payment area.

What Rates?

Retained earnings are intended to stimulate exports by linking imports to enterprises export successes. This purpose can be fulfilled only if the rate of retention matches the enterprise's operating conditions. If it is too high, it permits satisfying oneself with a minimal level of export production to cover the required retained earnings. If the rate is too low, enterprises search for sources of exchange earnings outside of the system distorting it. /Statistical data, experience, and observations have accumulated that should permit us to establish objectively a rate that without losing the stimulating effects on export will lead to long term planning for enterprise development, including future foreign exchange needs./

A second crucial problem is the effect of the system of retained earnings on the productivity of export production. Previous methods must be improved. /The price of foreign exchange spent on imports is determined by a uniform exchange rate for the zloty, but the cost for acquiring a unit of foreign exchange through exports varies. This should be reflected to a greater extent by the credits in the system of retained foreign exchange earnings./

The resolution of the Council of Ministers of 4 November 1985 on the details of the method for opening and using retained-earnings accounts deals with both problems. It establishes that "the development of the system of retained foreign exchange earnings for 1987-90, including making the rates uniform and relating the size of the retention to productivity of export will accord with the National Socio-economic Plan for 1986-90." This means the problem has been resolved by the Sejm resolution on the five-year plan, but the new methods will apply after 1987.

Small Changes in the Coming Year

For 1986, however, the rates established by the minister of foreign trade and the finance minister according to earlier principles will be retained.

/Neither a gradual change nor a general revision of current rates is anticipated during the coming year./ Inappropriate rates for the prevailing conditions, however, may be adjusted. The account holder is responsible for demonstrating the need for adjustment. Moreover, the anticipated balance of payments for 1986 will not favor increases in the rates.

Other issues were also resolved in the resolution.

/From the beginning of 1986, the system of retained foreign exchange earnings will include state and mixed enterprises, partnerships under trade law including publicly owned economic units, cooperatives or their unions, social organizations that conduct economic activities, and design bureaus with the status of legal persons./ The special regulations for pit mines, research and development centers, state higher schools, and those for inventions, technical innovations, and technical services will also remain in force.

Besides foreign exchange deposits, the resolution specifies that earnings will be retained from payments due from foreign clients discounted by domestic foreign exchange banks or payments made in other manners accepted by the minister of foreign trade. These can include shipments of foreign goods or payment of a financial debt by shipments of goods to a foreign client.

A choice between an accounting or a title form of retained foreign exchange earnings accounts has been introduced, though the domestic foreign exchange bank establishes the form at the request of the account holder. At present both types of accounts exist: accounting ones for state enterprises and title ones for most other types of economic legal entities.

Opening group accounts for retained earnings based on agreement of the interested parties remains in force. The methods for using these accounts is established in these agreements. Some of the partners in these accounts have reserved the right to use credits resulting from their exports to themselves. In such cases the group form of the account is purely formal, and it does not increase the flexibility in using the credits. Further, it would be wise for the partners to consider changing the agreement in such cases, for increased flexibility would increase the productivity of such funds.

7

For What Can They Be Spent?

As regards the uses of expenditures from these accounts, the principles adopted on 18 February 1985 by the Government Presidium with two changes that expand them were retained.

Funds from these accounts may be used to pay for imports that contribute directly to production or indirectly through organizing patent protection on a cooperative basis, for equipping the industrial health service, or for purchasing professional literature (an expansion of the February regulations).

The second changes applies to the range of cooperative partners to whom the account holder may transfer a portion of the credits. Until now it was restricted to those partners who participated in export production. This limitation has been lifted. /As of 1 January 1986, account holders may transfer a portion of their credits to their partners on the basis of contracts with them./

The right of foreign trade enterprises to retained earnings from foreign exchange earned through transactions that do not involve Polish goods was also confirmed. The range of possible uses was expanded to include purchases to improve their own trade facilities with the special agreement of the minister of foreign trade.

An Experiment with Rubles

Also on 1 January 1986 a resolution of the Council of Ministers comes into effect that establishes experimental retained foreign exchange earnings accounts in rubles. Discussion of these accounts has lasted a long time, but now they have assumed a concrete shape.

The principal problem was reconciling the agreed trade levels, in trade in transfer rubles, with account holders' free disposition of retained earnings.

The formula to be tried in 1986 calls for priority for ruble account holders in agreed imports, in purchases above agreed levels with the agreement of trading partners, and in paying for the costs of participating in symposia and congresses, internships at research enters and scientific institutes from retained ruble earnings. The principles for paying for this type of travel will be determined by the minister of finance and the National Bank of Poland.

The rate of retention of ruble earnings is a uniform 8 percent for profitable exports and 4 percent otherwise.

The experiment includes enterprises that have signed bilateral international agreements, that participate in long term cooperation with socialist countries, and that are completing proexport investments. The minister of foreign trade will designate these enterprises with the advice of the other ministers. Since it is experimental, there will not be many participants.

Success will depend on the availability of goods above levels covered by interstate trade agreements. Foreign trade enterprises will play an important role.

These enterprises can retain 5 percent of earnings above the agreed trade levels. Sums earned in this manner will pay for imports needed for production for export, and to pay for improving the foreign trade enterprises' own trade facilities.

The experiment will last through 1986. During the second half of 1986 the minister of foreign trade with the minister of finance will evaluate the system and submit recommendations for the future to the Council of Ministers.

NEW REGULATIONS GOVERNING SMALL-SCALE MANUFACTURING

Warsaw DZIENNIK USTAW in Polish No 48,30 Oct 85 pp 642-645

[Decree of the Council of Ministers of 9 Sep 1985 concerning the specific conditions for granting permission to conduct business in small-scale manufacturing by foreign legal and physical persons, DZIENNIK USTAW 1985, No 48, item 247]

[Text] On the basis of article 8 paragraph 5 of the resolution of 6 July 1982 concerning the principles for conducting economic activity in small-scale manufactures by foreign legal and physical persons within the People's Republic of Poland (DZIENNIK USTAW 1985, No 13, item 59), the following is decreed:

Art. 1. Whenever the decree speaks of

1) resolution, it refers to the resolution of 6 July 1982 concerning the principles for conducting business in small-scale manufactures in the People's Republic of Poland by foreign legal and physical persons (DZIENNIK USTAW 1985, No 13, item 58),

2) administrative organs, it refers to the local, general administrative state administrative organs at the voivodship level,

3) foreign economic objects, it refers to objects listed in art. 1, pr. 1 of the resolution,

4) permission without further qualification, it refers to permission to conduct business in small-scale manufactures mentioned in art. 2 point 1 and 2 of the resolution,

5) government plenipotentiary refers to the Government Plenipotentiary for Foreign Affairs for Small-Scale Manufactures.

Art. 2. 1. Application for a permission by a foreign economic object

1) which is a physical person should be signed by that person,

2) which is a legal person should be signed by the person entitled to represent it,

3) which is an unincorporated partnership should be signed by the partners.

2. If the application is submitted in person by the applicant or his legal representative, the signature should be notarized by a state notary o fice or a Polish diplomatic post or consulate.

3. An application for expanding the range of business can be signed by the applicant or his legal representative, if such authority is included in the power of attorney.

Art. 3. 1. Foreign economic objects that are physical persons or unincorporated partnerships must attach the following to the application:

1) an extract from the applicant's passport other identity document containing the applicant's personal data and citizenship,

2) a copy of the power of attorney defined in art. 9 of the resolution or permission to establish a representation issued on the basis of the decree of the Council of Ministers of 6 February 1976 on the conditions, manner, and organs authorized to issue foreign legal ana physical persons the right to establish representations in the People's Republic of Poland to conduct business (DZIENNIK USTAW No 11, item 63, and 1984, No 26, item 133),

3) a listing of the declared monetary and material foreign exchange investments for starting all the types of business anticipated, separating construction costs, costs of machinery, technical instruments, transportation, tools, administrative inventory, and other items,

4) a copy of the partnership contract if business is to be conducted in partnership with an office abroad that is unincorporated.

2. Foreign economic objects that are incorporated must attach the following to the application:

1) a copy of the act of incorporation (statute, contract) of the corporation,

2) certification of the appropriate state organ, in whose area the corporation has its office, stating that that corporation has registered in accord with the legal regulations binding in this state,

3) the documents in paragraph 1, points 2 and 3.

3. Partnerships, created by foreign economic objects, based in Poland with the exclusively foreign participation and partnerships created by domestic and foreign economic objects based in Poland must attach the following to the application:

1) a copy of the act of incorporation (contract, statute),

2) exchangeable-currency permits to contract the partnership and to contribute shares,

3) the documents in paragraph 2, points 2 and 3.

4. A foreign economic object should submit the following to the administrative organs before receiving permission:

1) a document stating the legal title to a site (building, terrain) designated as the home address of the enterprise and for conducting business or a temporary contract or other document stating that the applicant will gain title to this site (building, terrain) after receiving permission,

2) a certificate from the Polish Security Bank that the initial deposit has been made.

5. Applications listed in paragraphs 1-3 must include explanations describing the intended business, particularly the supply of raw materials, machines, and instruments and the method of production and sales.

Art. 4. 1. Until the power of attorney mentioned in art. 9, par. 1 of the resolution or if it is revoked or death, administrative decisions and written documents concerning the intended or current business will be sent to the foreign economic object and copies to the person designated by them.

2. In the cases of the revocation of a legal representative, his death or a summons to establish a new legal representative, the foreign economic object should, as soon as possible, but no later than three months, designate a candidate for legal representative. He must be accepted by the Voivodship Office for Internal Affairs appropriate to the enterprise's home address.

Art 5. 1. Documents submitted to the administrative organs should be in Polish or translated by a sworn translator. A translation done abroad should be notarized by a Polish diplomatic post or consulate.

2. The originals of the documents listed in art. 3, par. 1, point 2 and par. 2, point 1 should be notarized. Documents drawn up abroad should be certified by a Polish diplomatic post or consulate.

Art. 6. 1. Before issuing permissions, administrative organs

1) evaluate the congruence of the intended activity with the directives of the government plenipotentiary defining the preferred directions of development of production and services, with the voivodship socio-economic plan, and with the particular economic needs of the voivodship,

2) establish, whether the declared monetary and material foreign-exchange investment suffices for starting up all of the intended types of business described in accord with the opinion drawn up at the applicant's request by an expert selected from the list of regular specialists,

3) request an opinion of the applicant and his business activities by a Polish economic-commercial post or consulate,

4) determine whether the applicant or legal representative are listed in the Central Register of Convicts of the Ministry of Justice,

5) request the opinion of the voivodship internal affairs office,

6) determine whether the applicant has had a permission revoked.

2. Before issuing the opinion and after consulting the Polish Security Bank, the administrative organs establishes the size of the initial deposit.

Art 7. If doubts arise whether issuing the permission might conflict with an important social interest or the national economy or to establish particular conditions for conducting the described business, the administrative organs will consult the government plenipotentiary, the appropriate minister or director of a central institution before issuing the permission.

Art. 8. 1. In addition to the items established in art. 14 of the resolution, the administrative organs will include in the permission:

1) the name of the enterprise, including the first and last names or the names (firms) of the foreign economic object submitting the application,

2) the first and last names or name of the legal representative,

3) the conditions and limitations protecting important social interest or the national economy, if they are necessary in the circumstances, especially in the light of the expert opinions,

4) the sources for raw materials and supplies,

5) the deadline by which the foreign-exchange investments declared in the application are to be completed,

6) the pledge, before starting production and providing services, to meet the conditions established in the particular legal regulations concerning the given type of business, especially for location, construction, fire prevention, sanitation, health and safety, and the environment.

2. In the permission the administrative organ defines the object and range of business activity in accord with the classification of the national economy established by the Central Office of Statistics and with the Systematic Product List or Service Classification.

3. If according to the special regulations undertaking the particular type of business requires obtaining a special permission, the administrative organ, issuing the permission on the basis of the resolution, will include the condition that the particular type of business can start only after obtaining the special permission.

Art. 9. 1. In establishing the period of validity, the administrative organ will consider:

1) the type of intended business from the point of view of the national economy and the preferred directions of business,

2) the size of investments and their predicted depreciation period.

2. The expiration date for the permission will be the end of a calendar year.

Art. 10. 1. The range of the issued permission can be expanded at the request of the foreign economic object in cases of starting, outside of the enterprise's site, within the business described in the permission: a new plant, a subplant, an assisting plant, a warehouse, an office, a sales office that sells only the firm's products, or other assisting facilities, or a store.

2. In the case of the acceptance of or the change of partners, if this act does not lead to incorporation, are handled according to par. 1 and art. 3, par. 3, point 2.

3. In cases listed in par. 1 and 2 and in the case of each change of the contents of the permission, art 6, par. 1, point 5 applies.

4. Expanding the range of the permission onto the territory of another voivodship requires the agreement of the appropriate local state administrative organ. This organ supervises the activities of the branches and offices, mentioned in par. 1, on its territory.

5. The expansion of the permission does not require the submission of the documents listed in art. 3, par. 1, point 3 nor establishes the initial deposit.

Art. 11. 1. On application of a foreign economic object holding a permission the administrative organ, after determining the absence of any obstacles, can issue a special permission for:

1) conducting business as a separate enterprise that was previously conducted a subplant or branch,

2) starting a new enterprise,

3) undertaking business not included in the branch listed in the permission held, according to the classification of the Central Office of Statistics and the Systematic Product List.

2. In the case listed in par. 1, the regulations of art. 2-6 apply, and in the case listed in art. 1, point 1, before issuing a permission for a new business, the administrative organ will consult with the administrative organ that issued the permission for the previous business.

Art. 12. 1. On application by the foreign economic object, an administrative organ can issue a new permission if

1) the foreign economic object, after leaving a partnership, possesses the necessary capital goods to continue the same business,

2) the foreign economic object intends to continue the business conducted on the basis of the permission already held by

a) forming an incorporated partnership,

b) transforming an unincorporated partnership into an incorporated one,

c) transforming an incorporated partnership into an unincorporated one.

2. In the cases listed in pr. 1, art. 2-6 apply, but if the partnership, mentioned in par. 1, point 2, is based in Poland, attaching the documents listed in art. 3, par. 1, point 3 and par. 4, point 2 is not required.

Art. 13. 1. Issuing a permission to a foreign economic object that holds a permission requires he submit the document listed in art. 3, unless these documents are already in the records of the case or the situation covered in art. 12, par. 2 exists.

2. In cases listed in art. 11, par. 1, point 1 and art. 12, par. 1, point 1, the foreign economic object making application should declare a supplement to the foreign-exchange investment and the initial deposit, made in starting the enterprise from which the new enterprise is to be separated, in order to meet the minimum size specified in the resolution.

Art. 14. In evaluating the application of a foreign economic object that has gained title to a foreign small-scale manufacturing firm through inheritance, contract, or gift, articles 2-5, with the exception of art. 3, par. 1, point 3 and par. 4, point 2, apply.

Art 15. 1. If the conditions listed in art. 18 of the resolution are found to exist in the conduct of the enterprise's business, the administrative organ can summon the legal representative to remove the infringements by a given deadline, informing the owner and his representative that failure to remove the infringements will result in revocation of the permission; the organ may also summon the owner to change the legal representative, who permitted the infringements.

2. The administrative organ can revoke the permission of a portion of the type of business in which the conduct infringed the legal regulations or the conditions of the permission.

Art. 16. 1. The administrative organ issuing the decision to revoke the permission will establish the period required to close the business, no shorter than three months. The period shall begin with the day the decision becomes final.

2. The period for closing the business shall assure:

1) the owner can meet his obligations to the State Treasury, institutions and units of the socialized economic sector and other creditors and to the employees,

2) the interests of contracting parties.

3. The decision to revoke the permission will include a clause requiring the foreign economic object within seven days from the date the decision becomes final to:

1) add the phrase "in liquidation" to the name of the enterprise, and

2) to place in voivodship and national newspapers two announcements stating the enterprise is in liquidation and the anticipated deadline for closing the business; the announcements should be repeated two weeks later.

Art. 17. 1. After issuing all the decisions in the case of a permission, the administrative organ will, without delay, send copies of them to the office of government plenipotentiary, the appropriate treasury chamber, Polish-Polonia Chamber of Industry and Commerce, and the voivodship office for internal affairs. Copies of decisions to revoke a permission should also be sent to the appropriate branch of the Polish Security Bank.

2. Copies of decisions to permit business in another voivodship shall also be sent to the appropriate local administrative organ.

Artl. 18. 1. The administrative organ shall maintain a register of the issued permissions and a register of denied permission.

2. The contents and the method for maintaining the registers will be determined by the Ministry for Domestic Trade and Services.

Art. 19. The decree becomes effective on the day of issuance.

REGULATIONS GOVERNING WORKER PARTNERSHIPS

Warsaw DZIENNIK USTAW in Polish No 48, 30 Oct 85 pp 645-647

[Decree of the Council of Ministers of 4 October 1985 Concerning Worker Partnerships, DZIENNIK USTAW 1985, No 48, item 248]

[Text] On the basis of art. 86, point 2 of the resolution of 14 December 1982 about provisioning retired employees and their families (DZIENNIK USTAW No 40, item 267 and 1984, No 52, items 268 and 270), art. 43, point 43, point 3 of the resolution of 12 June 1975 concerning social services for work related accidents and illnesses (DZIENNIK USTAW 1983, No 30, item 144), art. 3, par. 8, point 2, letter a) of the resolution of 29 December 1983 on National Vocational Mobilization and Retraining Fund (DZIENNIK USTAW 1984, No 75, item 334 and 1985, No 37, item 194), art. 29c, point 2, letter b) of the resolution of 26 February 1982 concerning taxation of units of the socialized economic sector (DZIENNIK USTAW 1984, No 16, item 75 and 1985, No 12, item 50 and No 37, item 174) and art 13 of the resolution of 3 December 1984, Budget Resolution (DZIENNIK USTAW no 56, item 283), the following is ordered:

Art. 1. 1. The decree defines the principles and manner for establishing worker partnerships, referred to hereinafter as partnerships.

2. The partnerships can be organized in state enterprises, research and development centers, higher schools, design offices, and in other state organizational units, cooperatives and their unions, and in civic organizations that conduct businesses and their organizational units established to conduct such business, referred to hereinafter as economic units, for the purpose of:

1) establishing production or essential semifinished products, furnishing the machinery and cooperative elements,

2) conducting maintenance work, regeneration, and producing spare parts,

3) designing and introducing technical innovation, ensuring an increase in productivity or reducing the material and energy consumption of production,

4) providing services for the people and units of the socialized sector of the economy,

5) conducting retail sales or a service.

3. The members of the partnerships can work, outside of their normal, binding worktime, on unused or idle equipment and installations. Pensioners and retirees, and women on child-rearing leave can also work during normal worktime.

4. In economic units youth partnerships working for the Youth Social Action Fund can be established. The principles for youth organizations undertaking work for the Youth Social Action Fund are contained in separate regulations.

5. The conditions for conducting business by a partnership are:

1) in production and the provision of services for external recipients, the certainty of a profit above the business costs, including those of using the machines and equipment of the economic units,

2) in production and provision for the maternal unit, the costs shall not exceed those of normal worktime or subcontracting the work to another economic unit,

3) in organizing partnerships for designing and introducing technical innovations, the benefits from them must exceed the costs of introducing them.

Art. 2. 1. The partnerships may include the employees of the economic unit, retirees, pensioners, women on child-rearing leave, and members of their families and employees of thier units.

2. Directors of economic units should make participation in a partnership depend on the proper performance of duties during normal worktime.

3. Members of a partnership will select from among themselves their director, who will represent the partnership and in the name of its members conclude contracts with the economic unit, referred to hereinafter as a contract of the partnership. Assigning a power of attorney to the partnership's director for representing the partnership and concluding contracts in its name is done according to the principles and manner defined in the Civil Code.

Art. 3. 1. In particular, the contract of the partnership should define:

1) the obligations of the economic unit to provide the partnership with raw materials, supplies, semifinished products, goods, fuels, energy, and spare parts in quantities appropriate to the size of the production, sales, and services,

2) the hours of work on defined days of the week (month),

3) the quantity of finished or semifinished products (work and services) the partnership should produce of the appropriate quality, including normal production losses and defects,

4) the place and conditions of acceptance and the storage of raw materials, supplies, semifinished products, fuels, spare parts, and the final products, or goods, or the provision of services,

5) the wages of the partnership for:

a) products, production phases, work, repairs, or an analogous variety or type of services similar to those performed by the economic unit calculated on the basis of direct and indirect unit costs from the last semiannual period during normal worktime guaranteeing profitability,

b) other orders, calculated according to the quantity and character of the work performed and according to the conditions of art. 1, par. 5.,

6) deductions from wages for exceeding the contracted level of production losses and defects,

7) the principle of responsibility for production, repairs, and work covered by the contract,

8) the range of technical supervision by the economic unit and the forms of cooperation with the partnership,

9) the director representing the partnership to the economic unit.

2. The Civil Code applies to the contract of the partnership.

Art. 4. 1. Wages for the partnership will be delivered to the director of the partnership.

2. The wages shall be divided within the partnership by the director in accordance with the rules established by the partnership.

Art. 5. 1. Positions that require qualifications may be filled by members of the partnership with the required qualifications or who know how to operate the machinery and equipment used in the work and who have the requisite health.

2. The economic unit's technical supervisors will control the partnership's work and decide which positions can be filled by partnership members without the appropriate qualifications.

3. The costs of maintaining technical supervision will be born by the economic unit.

Art. 6. 1. The Minister of Labor, Wages, and Social Services will exclude the wages to the partnership from the wages subject to overtime tax rates.

2. Wages paid partnerships are not subject to taxes for the National Vocational Mobilization and Retraining Fund as described in other regulations.

3. Production by the partnership should be recorded separately by the economic unit, and its value for calculating taxes for the National Vocational Mobilization and Retraining Fund is excluded from the value of production sold by the economic unit (also in calculating the production in natural units). If the unit employes a net-production-sold measure of value, then material cost, proportional to the share of the production by the partnership in the total value of production sold, is also excluded.

Art. 7. 1. The economic unit bears the responsibility for the safety and working conditions of the members of the partnership.

2. In case of an accident, the members of the partnership or members of their families have the right to social services as stated in the resolution of 12 June 1975 concerning social services for work related accidents and illnesses (DZIENNIK USTAW 1983, No 30, item 144).

Art. 8. Wages of retirees and pensioners working in partnerships are not subject to the limits stated in the decree of the Council of Ministers of 7 March 1983 concerning wages or other income earned by retirees and pensioners (DZIENNIK USTAW 1985, No 40, item 197).

Art. 9. 1. Partnerships organized by budgetary units should act as auxiliary economic units.

2. In partnerships organized in budgetary units, profits from the partnership's work will be retained by the economic unit.

3. Impersonal wages in auxiliary economic units and budgetary units that form partnerships can be exceeded by payments to the members of these partnerships within the income above plan due service provided and production above the plan.

Art. 10. Art. 6, par. 2 applies to taxes for the National Vocational Mobilization and Retraining Fund for 1984 and 1985.

Art. 11. The Decree of the Council of Ministers of 14 November 1983 concerning worke s' partnerships organized in economic units producing for the market is hereby cancelled (DZIENNIK USTAW no 68, item 302 and 1984, No 39, item 203).

Art 12. The decree becomes effective on issuance.

NEW REGULATIONS GOVERNING FIRM HARD CURRENCY ACCOUNTS

Warsaw MONITOR POLSKI in Polish No 32, 7 Nov 85 pp 375-376

[Cabinet Law No. 152 from 4 October 1985: "Concerning Specific Rules for Opening and Using Hard Currency Accounts in Convertible Currency"]

[Text] On the basis of article 28 paragraph 4 of the Law of 26 February 1982 Concerning Financial Management of State Enterprises (Journal of Laws of the Polish Republic: No. 15, item 74; No. 26, item 129; No. 34, item 181; No. 54, item 275, all from 1984; and No. 37, item 174, from 1985) and in connection with article 17 paragraphs 1 and 2 of the Law of January 31, 1985 Concerning Small Manufacturers (Journal of Laws of the Polish Republic: No. 3, item 4) as well as article 86 of the Law of September 16, 1982--Cooperative Law (Journal of Laws of the Polish Republic: No. 30, item 210; No. 39, item 176, from 1983) the Cabinet has resolved the following:

1. The law designates the guidelines for establishing the amount of hard currency originating from the sale of goods and services abroad to which a business enterprise is entitled and the utilization of these funds. The law applies to state and mixed enterprises, trade law partnerships working with government run enterprises, cooperatives and their unions, social organizations pursuing economic activity, and organizational units of the "Polish Post, Telegraph and Telephone".

2. According to the law the receipt of hard currency may be:

1) The receipt of hard currency and cash in convertible currency by the National Hard Currency Bank;

2) The acknowledgement of debts in a foreign bank on behalf of an organized enterprise;

3) The receipt of clearing currency in settling accounts with countries of the second area of payment;

4) The realization of the amount due in a different form than the receipt of foreign currencies, determined by the minister of foreign trade to be the equivalent to the receipt of convertible foreign currency;

5) Credit amounts due from foreign contracting parties resulting from the sale of goods and services, recognized as adequately secured and discounted by the National Hard Currency Bank.

3. 1. The amount of hard currency at the disposal of the individual firm is the amount of hard currency received minus:

1) transaction costs, including shipment, insurance, commissions for foreign agents, and any payment in hard currency to the project originators;

2) amortization of hard currency installments and interest obtained in accordance to the contract concluded between the National Hard Currency Bank and the individual enterprise;

3) hard currency expenses due to correcting defects in exported goods or due to returned goods, with the stipulation that should there be hard currency expenses the unit of foreign trade may request that the National Hard Currency Bank deduct that portion from the hard currency account of the producer of the defective goods or services;

4) installments received from foreign contracting agents, accumulated in accounts of export installment funds kept in the National Bank, appropriated in their entirety for imports needed for the implementation of production geared toward export;

2. The amount of hard currency at the disposal of transportation and fishing enterprises and organized government entities of the "Polish Post, Telegraph and Telephone" are determined by:

1) the receipt of convertible currency from foreign contracting agents;

2) the value of transporting services undertaken on behalf of units of foreign trade, determined by carrier invoices;

3. Hard currency accounts for units of foreign trade are to be determined by surplusses in receipts in convertible currencies, obtained through re-export transactions and specific foreign trade transactions of a temporary nature.

4. 1. The rate of hard currency earned to which individual firms are entitled determines which portion of the hard currency receipts mentioned in 3 is included in the hard currency account.

2. The amount of hard currency that the individual firm has at its disposal is determined by the minister of foreign trade in agreement with the minister of finances.

5. 1. Hard currency acoounts are accumulated in a separate account of the individual enterprise kept in the National Hard Currency Bank.

2. Hard currency accounts may be either of a recorded or a property nature. The nature of the account is determined by the National Hard Currency Bank at the request of the individual enterprise.

3. The individual enterprise has the funds accumulated in the hard currency account at its disposal.

4. Individual enterprises may agree to open a comprehensive hard currency account, delegating the right to administer in their name the funds accumulated in the account either to the unit of foreign trade, the association or the unit chosen from among the participants in the agreement. In this case the organizing unit is not entitled to an individual rate for the hard currency account.

6. 1. The individual enterprise may allocate the hard currency funds accumulated for the following purposes:

1) for the financing of imported supplies for current production needs, and in special cases, as a supplement to assure purchases which are encompassed by centrally-financed imports and the implementation of tasks resulting from operating programs and government orders;

2) for the financing of the importation of replacement parts and materials, as well as articles serving for the continuation of production capabilities and those of cooperating enterprises in production;

3) for the financing of the importation of machines and equipment with the goal of creating and modernizing permanent production assets or for the investment needs connected either with beginning pro-export production or the initiation of scientific-technical progress creating the possibility of export;

4) for the development of an indispensible national cooperative network and for lowering hard currency expenses incurred through the financing of imports for the production of finished goods, especially those for export;

5) for the payment of installments and interest on hard currency credits in accordance with the agreements concluded with the National Hard Currency Bank;

6) for the protection of inventive projects, the buying of licenses and scientific-technical achievements connected to production;

7) for the financing of importation of medical apparatus and equipment for the health service, providing they are undertaking production activity or services characterized by arduous conditions hazardous to health;

8) for the purchase of professional literature.

2. Transport and fishing industry enterprises and government organized entities of the "Polish Post, Telegraph and Telephone" may allocate hard

currency funds accumulated in the account for the purposes mentioned in paragraph 1 and for covering expenses connected with operating a canvassing activity as well as for the payment of installments and interest on foreign credits.

3. Units of foreign trade may appropriate the funds accumulated in the hard currency accounts for the financing of:

1) transactions mentioned in article 3 paragraph 3;

2) the importation of export production in export production units;

3) the importation for improving own technology of trade activity on the basis of individual decisions of the Foreign Trade Ministry.

4. Organized entities possessing hard currency accounts relinquish a portion of the hard currency funds to the hard currency account of cooperatives and other units cooperating based on the agreements concluded between them which deal with the production of finished goods or directly finances from its own hard currency account the import needs of cooperating enterprises and any units working in cooperation in the realm mentioned in paragraph 1.

5. Cooperatives and other units working in cooperation in the implementation of production may accumulate the obtained hard currency funds in accounts with the National Hard Currency Bank and appropriate them for purposes mentioned in paragraph 1.

7. 1. For the year of 1986 the rates of hard currency set by the Minister of Foreign Trade and the Minister of Finances on the basis of 5 paragraph 1 of Cabinet Law No. 134 of June 28, 1983 Concerning the Use of a Percentage of Hard Currency Receipts Gained from the Selling of Goods and Services in Export (Journal of Laws of the Polish Republic: No. 18, item 157).

2. If demonstrated that the amount of the rates are inappropriate for the conditions of 1985 the Ministry of Foreign Trade in agreement with the Minister of Finances may set the rate at a different limit.

3. Taking into consideration the standardization of rates as well as the dependence between the size of the account and the export effectiveness, the formation of a system of hard currency accounts for the years 1987-1990 will occur according to the principles determined in the social-economic plan for the years 1986-1990.

8. Cabinet Law no. 134 from June 28, 1982 Concerning the Use of a Percentage of Hard Currency Receipts Gained from the Selling of Goods and Services in Export (Journal of Laws of the Polish Republic: No. 18, item 157).

9. The law takes effect on January 1, 1986

ECONOMY POLAND

PLANNING CHIEF OUTLINES COVERAGE PLAN, ROLE OF BIWEEKLY

Warsaw RZECZPOSPOLITA (REFORMA GOSPODARCZA No 22 Supplement) in Polish 12 Dec 85 p 1

[Article by Franciszek Kubiczek]

[Excerpts] The duties of the Office of the Governmental Plenipotentary for Economic Reform have been assumed by the Planning Committee of the Cabinet. In connection with this, the supplement "Economic Reform" will henceforth be edited and published by the Planning Committee and RZECZPOSPOLITA.

Materials, information and essays which deal with the functioning of the economy and business in particular will predominate in the columns of REFORMA GOSPODARCZA. The main topic line will be upheld and continued.

We will treat the supplement as an instrument of dialogue between the central planner, those deciding economic matters and business management. We will broadcast our own information, appraisals and suggestions in the supplement, and at the same time ask for opinions, appraisals and suggestions from the business community. Businesses-consultants will play a role that is especially important in this dialogue. The planning committee will continue the procedure of cooperation with them which was established earlier. As in the past, they will receive for consultation information and proposals of the intended solutions in the system. In addition, there will be meetings with representatives of the government and various central institutions. We intend to braoden the scope of these consultations and meetings about issues dealing with the central plan.

Normative acts concerning economic instruments, mechanisms and parameters will also be published immediately upon being signed. They will be accompanied by complete explanations, commentary, and to the extent necessary, training materials prepared by the project authors of these legal regulations. Particular attention will be paid to the intentions and expectations which are contained in the normative acts under study.

In addition, analyses and appraisals of good and bad examples taken from business activity will be published. There will be examples of initiative, accomplishment, development activity, sound economic thought as well as examples of inefficiency, short-sighted activity, lack of economic discipline, particularly those concerning economic relations. Circumstances which inevitably lead to a collapse of a business will also be discussed.

We will try to take full advantage of the Planning Committee's information base and publish problematic and macroeconomic appraisals meant for business management personnel. These appraisals will chiefly cover the economic situation of the country together with indication of potential trouble, irregularities, and deviations in the implementation of the central plan. In addition, there will be discussions of economic policy assumptions and problems, both current and long-range with special regard paid to the program of structural changes, scientific-technical progress and activities aimed at saving materials, fuel, energy and raw materials.

The supplement will diseminate the experience of socialist countries in improving the functioning of the economy. It will also discuss issues of the integration process into the framework of the Council of Economic Mutual Assistance, such as the creation and functioning of joint enterprises, joint investing and technical ventures, the development of direct connections between Polish businesses, scientific-research units, planning-construction units and their counterparts in socialist countries.

In theory, REFORMA GOSPODARCZA will continue to be a biweekly. However, when the need arises it will appear more freqently. The Planning Committee and RZECZPOSPOLITA plan for some issues of the supplement to be devoted in their entirety to one topic. Supplements in the near future will be devoted to the problems connected with the bestowing of awards, workplace economic groups, and various other topics.

The Planning Commission is counting on the cooperation of the readers very much and for this thanks them in advance.

BRIEFS

GENERATOR FOR NUCLEAR POWER PLANT--In the lower Silesian Electrical Machine Building Plant "Domel" in Wroclaw construction has begun on a 500 MW turbogenerator intended for the first Polish nuclear electric power plant in Zarnowiec. This will be the largest electrical machine built in Poland. The 500 MW turbogenerator was designed by the "Domel" design bureau, adapted by licence from a design of the Swiss firm BBC. During the first phase of of production the "Domel" construction crews will process many parts, equipment, body plates, etc. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Nov 85 p 1] 9970/12948

MACHINE TOOL COOPERATION WITH USSR--Vicepremier Zbigniew Szalajda recieved the Soviet minister for the machine tool industry, and chairman of the CEMA Committee on Cooperation in the Machine Industry, Boris Bal'mont. The discussion dealt with matters relating to enhancing cooperation within CEMA and on increasing mutual deliveries in the machine tool area. Also discussed were problems related to enhancing scientific-technical cooperation and setting up joint organizations to increase cooperative deliveries between the two countries, as well as modernizing and improving the selection of goods produced. Soviet ambassador Aleksandr Aksenov participated in the meeting. [Text] [Warsaw ZYCIE WARSZAWY in Polish 21 Nov 84 p 6] 9970/12948

NEW GANTRY FOR PORT--The teams of Mozostal Poznan and Elektromontaz Szczecin have completed installation of a large gantry on the modern crane on Hutnikow Embanknment at Swinoport. Also involved in the operation was the largest floating crane in Poland, which belongs to the Polish Ship Salvage Enterprise of Gdynia. The new crane will be used to unload ore from the largest ships visiting the port of Swinoujscie. Together with the enormous gantry it is 72 meters high, the highest such piece of equipment at any port on the Szczecin coast. It will be able to unload 70,000 tons ships, some of which are already in service in the Polish Steamship Company [PZM], and whose number will continue to increase in coming years. The crane's daily output is more than 24,000 tons. This will considerably shorten the time spent on unloading large ships. [Text] [Warsaw ZYCIE WARSZAWY in Polish 23-24 Nov 85 p 6] 9970/12948

POLISH-ITALIAN AUTO INDUSTRY TALKS--A delegation of the Polish auto industry, led by Janusz Maciejewicz, minister of machine industry metallurgy. The delegation held talks with the management of FIAT, devoted to cooperation between Poland and that company, especially as regards prospects for cooperation in production of low and medium power passenger cars. [Text] [Warsaw RZECZPOSPOLITA in Polish 21 Nov 84 p 1] 9970/12948

POLISH-PAKISTANI MINING, ENERGY DEAL--A delegation of the Ministry of Water and Energy of the Islamic Republic of Pakistan has concluded a visit to Poland. On 22 November the head of the delegation, Minister Mir Zafarullah Khan Jamali, was received by Vicepremier Wladyslaw Gwiazda. On 22 November the Pakistani guest and Viceminister for Mining and Energy Ryszard Buchowiecki signed a protocal which provides for a significant increase in Polish-Pakistani cooperation, including technical cooperation, in mining and energy. [Text] [Warsaw TRYBUNA LUDU in Polish 23-24 Nov 85 p 2] 9970/12948

FOREIGN TRADE MINISTRY--Warsaw, Jan. 25--On the motion of the foreign trade minister, the prime minister appointed Helmut Stefan Floeth, an economist, to the post of under-secretary of state at the ministry. Helmut Stefan Floeth, 50, was born in Dortmund. He earned his degree in economy at the Warsaw Main School of Planning and Statistics. For over 28 years now, he has been working at the Foreign Trade Ministry, holding managerial posts in Poland and abroad. Recently, he was deputy head of a department at the Foreign Trade Ministry. TONNAGE CARRIED BY STEAMSHIP COMPANY--Half a billion metric tons of goods have already been transported by the fleet of the Polish Steamship Company [in its history]. The loading of the symbolic half-billionth metric ton took place today in Swinoujscie on the ship "MS Walka Mlodych." [Text] [Warsaw Television Service in Polish 2025 GMT 30 Jan 86 LD] /6091

LIGNITE MINE EXTRACTION--At the Konin lignite mine, the 250 millionth metric ton of coal has been extracted. [Excerpt] [Warsaw Television Service in Polish 2025 GMT 30 Jan 86 LD] /6091

REGIONAL INSPECTORATE FINDINGS--Activity for the protection of the interests of consumers and [protection of] public property, undertaken by the regional inspectorate of the State Trade Inspectorate (PIH) in Poznan, was the subject of today's conference attended by PIH Chief Inspector Piotr Ostaszewski; Deputy Voivoda Tadeusz Zajac; and the director of the NIK [Supreme Chamber of Control] delegation in Poznan, Jozef Adamczyk. The head of the regional inspectorate, Waclaw Wierzbicki, reported that 2,000 check-ups aimed at combating speculation in the trade network were conducted last year as well as 5,000 quality control checks. One thousand cases were submitted to the courts and the penal-adjudicating courts [kolegium karno-orzeka-jace]. A lowering of the prices of goods not corresponding to the stated quality--by 9 million zlotys--was ordered. Inspections were carried out at 150 shops last month, of catering establishments and service premises. Again, several dozen irregularities were revealed. Such activity will be continued in the present year with stepped up intensity, in conjunction with other organs of control, inter alia the worker-peasant inspectorate. [Text] [Wroclaw Domestic Service in Polish 1607 GMT 31 Jan 86 LD] /6091

'DRY PORT' TRANSSHIPMENTS FROM USSR--(PAP) During the first 10 months of this year the crew of the country's largest land port Zurawica-Przemysl-Medyka has already received 9.5 million tons of raw materials and goods delivered to us by the USSR. This is more than 800,000 tons more than foreseen in the plan. Recently the deliveries have been greatly increased and the rate of deliveries has yet to slacken. During the past 24 hours the port has received more than 35,000 tons of various shipments. Soviet trains regularly arrive in Medyka and Zurawica bearing refined concentrates of ore and open-hearth pig iron for Polish steelworks as well as other goods. ALBANIA

ACADEMY PRESIDENT REPORTS ON VISIT TO GREECE

Tirana ZERI I POPULLIT in Albanian 26 Dec 85 pp 3-4

[Article by Prof Aleks Buda, president of the Academy of Sciences of the People's Socialist Republic of Albania: "Visit to a Friendly Country"]

[Text] The invitation which the Academy of Athens, the National Academy of Greece, directed to us some time ago to make a visit and to deliver a scientific address there, was a friendly gesture of the neighbor country's high level center of culture toward our Academy of Sciences. It gave us the opportunity during our stay to visit a number of institutions of the academy and to become acquainted with their activity, also to conduct fruitful negotiations related to the possibility of cooperation between our two institutions in a number of fields.

It is understandable that this trip and its purpose aroused special interest on our part. We were going to the hearth of an ancient and enlightened culture, to the homeland of great figures who represent centuries of world culture. We were going to a land which has fought for freedom down through many centuries, from legendary Thermopylae to the battles of the people's struggle for independence of 1821 and of the great war against the Italian and German fascist slavemasters; and we could not forget that in many of these historic events and encounters the people of our two countries had stood alongside one another in battle against our common enemies. As Comrade Enver Hoxha said, with the keen analysis of a historian and the lively experience of a contemporary and participant in the most dramatic events of the time, these were the circumstances which created the objective factors which stand at the foundation of the friendly feelings of the two peoples. Historical experience has made it plain that the true interests of nations are represented by those social factors which attempt to realize the basic tasks of the time: socio-political liberation, material and cultural progress, the free and independent development of the country, peaceful cooperation among peoples. Regardless of obstacles, historical experience shows us that there have always existed circumstances and reasons which make this cooperation possible. History is a witness that from these relations have come a chain of fruitful impulses which have had a positive influence on the mental and cultural life of our countries, as always happens when people have the possibility of adopting new progressive ideas by common cultural work.

Devoted to this road of receiving and giving in its different aspects was the address "Albanian-Greek Meetings Under the Sign of Illuminism in the 19th Century," which was delivered before the plenum of the Academy of Athens with the attendance of Greek and foreign scientists, also other personalities, friend and well-wishers of our land. It outlined the road of Greco-Albanian cultural and political relations from the Middle Ages and paused especially in the middle of the 19th century, when the Albanian cultural and socio-political movemnt entered as a self-determining factor in a new higher stage in the ranks of Balkan liberation and democratic movements. On the road of warfare for liberation from political slavery and intellectual and spiritual shackles of the common enemies, the regime of the sultan and his ally the patriarch of Constantinople, the Renaissance figures of the Balkans and all this region including Greeks and Albanians, sought and found weapons in the militant ideology of western Illuminism. It was not by chance that the first Albanian ideologists such as Naum Veqilharxhi, Thimi Mitko, Jani Vreto, Kristoforidhi and after them Ismail Qemali, Naim and Sami Frasheri, in the struggle for the national rights of their own people, as likewise the Greek Renaissance figures used those same arguments against the universal medieval concepts, that it was not religion and state's rights which determined the destiny of a people.

From these common progressive positions the Renaissance figures developed their efforts; consistently they pursued these principles even when they were obliged to direct criticism and finally even warfare against those who had formerly been their own teachers. With this the Albanian Renaissance affirmed its own maturity and ideological and political emancipation, beginning, as was natural and understandable with the concrete socio-historical conditions of their own homeland. History has never been a smooth flow of events; the dialectic of class societies brought it about that the history of our two neighboring peoples in the 19th century knew both ideological contradictions and conflicts, often incited by external factors expressed negatively to the harm of the two peoples. Impressing you today, even as it did not fail to do among those who heard their addresses, was the mental consistency with which J. Vreto, Thimi Mitko, P. Vasa, Thimi Brandi presented the historico-scientific and political arguments which sought and made possible cooperation of Albanians with their Greek neighbors and vice versa. Not a single bit of harm could come to the Greek people from a liberated and independent Albania. Of this opinion were also a number of figures of Greek political thought of the time, among whom the traditional feeling of friendship toward the Albanian people found expression; such were Z. Sotiriu, L. Vulgaris, A. Gudhas, the first Greek specialists, the Albano-Greek Panajot Kupitori, A. Kullurioti and others. These feelings and thoughts found an especially inspiring expression in the poem of our great poet Naim Frasheri, "The True Desire of Albanians." They were quotations from this poem which closed the address amid the applause of the auditors.

It was a great pleasure for us to hear viewpoints similar in tone expressed in the speech by which the President of the Academy of Athens Prof Dr Lukas Musulas presented and greeted our delegation before the audience. His words were nourished by the traditional freeling of the Greek people for our people. It wasnot only these, but also the objective circumstances of the times which according to his words, sought to bring a closer fellowship among the scientists of the two countries. In the conversations which developed among the representatives of the two academies, we emphasized that regardless of the fact that there may exist certain differing viewpoints on a number of matters, especially in the historical sciences, we think that a better acquaintance with the results of research carried out by the scientists of the two countries in different fields, the exchange of experience gained and constructive debate about them, constitutes a very valuable road. The widening and deepening of scientific relations between our two countries will be able to serve this purpose. In the field of history such an attitude of cooperation, for example, would be able to help build relations between the two peoples in the objective manner which the interests of the people themselves demand.

Corresponding to these viewpoints were the opinions expressed by the president of the host academy, who stressed the interest of the Academy of Athens in each cultural and scientific activity on an international scale, a matter expressed in the signing of agreements of cooperation with a number of academies, among which the Academy of Athens wished to have an agreement also with the Academy of the People's Socialist Republic of Albania (RPSSH).

These benevolent attitudes of both parties, and of the governments of the two respective countries, made it possible on November 28, 1985 to sign at the seat of the Academy of Athens an agreement of cooperation between the Academy of Science of the RPSSH and the Academy of Athens. The signing was accompanied by a solemn act in which a representative of the Ministry of Foreign Affairs of the Republic of Greece and of the RPSSH also participated. Signing the agreement, both parties expressed the wish "for a prosperous and fruitful cooperation" between the two institutions, a thing which would also serve to strengthen cooperation between the two neighbor countries and the two friendly peoples.

The conference held at the seat of the academy, the ceremonial act of signing the agreement and the many cordial meetings which our delegation had on different occasions with distinguished personalities of scientific and cultural life, as well as political circles and Greek journalists, gave us the opportunity to ascertain the broad sympathy which our country and its friendly policy toward the neighbor country enjoys in the broadest circles of Greek public opinion. Especially warm were the meetings with a number of Greek scientists of different disciplines and institutes who have visited our country over the years, invited by our Academy of Sciences on the occasion of national or international conferences. All of them cherished very warm memories of the reception which they found in our country and highly valued the achievements of our science in different fields, such as, recently, the Assembly for Illyrian Studies.

Especially worth emphasizing was the meeting with the minister of foreign affairs of the Republic of Greece, Mr Carolos Papulias, who, in the two meetings which he had with our delegation expressed himself in a very warm and cordial manner in regard to the agreements between the two peoples and out lands. Responding to our thanks for the honor shown by his attending the address held at the academy, regardless of its length, the minister emphasized that this was truly a visit to scientific character, but it should not be forgotten that it also had a political significance for both parties, because it helped to further deepen the friendly agreements not only of scientists, but also of the two peoples and our two lands. In this direction the scientists and men of culture and the arts generally in the two countries have a special role. He emphasized that he wished such visits and conferences were more frequent, and voiced the desire to help in any way in this direction. On our part it was emphasized that even with the difficult conditions of the past we have certainly given importance to these agreements, as evidence by the number of invitations extended to Greek scientists.

The delegation made a number of visits to certain study centers near the Academy of Athens, also to different museums of archaeology and medieval art. These visits showed the high standard attained by Greek science, and on the other hand, the great interest which Greek scientists of different fields display for closer agreements of cooperation with scientific insticutions of Albania. Many requests were made for exchanges of scientific literature and for visits to our country, not only in the field of history and culture, but also in the biological, natural and other sciences. The two countries have many similar or common conditions. In this direction the signing of the agreement of cooperation between the two academies met with general approval which we even came across in the university circles of Athens, Ioannina, etc.

A visit to Athens and to Greece generally would not be complete without devoting attention also to the many monuments of art and culture, to the beauties of nature for which this land is so rich and famous. And even if it were not the first time, a visit to the Acropolis cannot fail to leave deep, unforgettable impressions. Standing in the center of the city, the majestic rock endowed with immortal monuments is everywhere present; it is seen from every part of the city; on it fall the first rays of the sun and from it fade the last. Although the great masterpiece of Phidias is missing today, the statue of the goddess who gave the name to the city, Pallas Athena, lives and will live forever, the goddess of wisdom, knowledge and science. With adoration we climb the steps which take us to the masterpieces of world art, but we go with adoration also toward that place where the freedom-fighters with courage raised the national flag in the dark night of fascism as a sign of the triumphant future. Great work is being done at the Acropolis for the protection of endangered monuments.

The visit to Cape Sunion awakens unforgettable emotions: to stand on the heights washed by the light at the base of the Temple of Poseidon, to see the endless breadth of the azure sea, makes you immortalize the deep emotions. With friends and Greek colleagues we recite the majestic verses of Homer and their heavy epic tolling makes us see in the azure blue of the sea at our feet the vessel of the shipwrecked Odysseus who, beaten by the waves, seeks the way to the homeland. And the eye thirsting for poetry discovers on a hidden edge of a classical column the name of the great Byron, poet and friend of freedom-fighters, Greek and Albanian and wherever they were. He left here his own modest signatures: "Byron 1815."

You cannot set you foot anywhere in Greece without encountering history. In the old city of Ioannina we pass with special excitement, with a feeling of emotion, through the streets and alleys, seeking the old Zosime school. We are moved with emtion when we remember that this pavement was trodden in the past by the feet of Jani Vreto, Kostandin Kristoforidhi, Ismail Oemali, Abdyl, Naim and Sami Frasheri. Majestic, epic in its kind is the fortress of Ioannina: stone, harsh rock, washed with blood, that fortress about which we long ago as children in distant Elbasan sang the song learned from our mothers: "O fortress with battlements / what a lion you have within, / Ali Pasha with seven hearts."

But it is not only the pulse of history which beats in Ioannina. It is a lively city where new scientific forces are setting on its feet a new active university, full of initiative. There we find deep friendly feelings. The address was given there with a very wide attendance from very different circles: professors, students, ordinary people and friends from our country.

Escorted by the Rector of the University of Ioannina Professor Dhimitrios Metaxas and other colleagues and friends, we leave this city taking the best and warmest memories, as from all of Greece. Crossing the state frontier at Kakavije by night, we remember on this occasion another episode with much significance. In the ceremony of the opening of this border point, which was turned into a popular festival, professors of the university also took part, and one of them sent us a very meaningful gift: one of his books for his Albanian colleagues.

CHNOUPEK DISCUSSES DISARMAMENT WITH FRG'S GENSCHER

LD051636 Hamburg DPA in German 1531 GMT 5 Feb 86

[Excerpts] Karlovy Vary, 5 February (DPA)--Czechoslovak Foreign Minister Bohuslav Chnoupek has today stressed the common responsibility of the Europeans for security and disarmament, which FRG Foreign Minister Hans-Dietrich Genscher has repeatedly emphasized. During the German-Czechoslovak talks at the foreign minister level in Karlovy Vary, the ministers conducted a thorough discussion of opportunities for contributing jointly to success in the Stockholm disarmament conference, the Vienna talks on troop reductions and the CSCE process as a whole. The central organ of the Czechoslovak Communist Party, RUDE PRAVO, praised Genscher's initiatives on the same day.

At this 12th German-Czechoslovak meeting between foreign ministers, Chnoupek stressed the "mutual interests" in an expansion of bilateral relations. Genscher expressed the hope that it would be possible to conclude the environmental agreement, which has been in preparation for a long time, by the summer. At the same time, however, it was made clear that the Prague Government has not yet been able to decide to accept the German demand to include West Berlin.

On the subject of the most important German demand, the worldwide banning of chemical weapons, on which discussions are currently being held in the UN Disarmament Committee in Geneva, Choupek repeated in an after-dinner speech the East's view that regionally limited agreements should be made ahead of any eventual agreement.

For the German foreign minister, who wants to make the meeting in the CSSR the starting point for a new series of contacts in connection with Ostpolitik this year, it is especially important how the Czechoslovak leadership evaluates the East-West situation after the Geneva summit. Chnoupek here called insistently on the West to take the disarmament proposals made by Soviet Party Chief Mikhail Gorbachev seriously. However, this presupposes a renunciation of the U.S. Stratigic Defense Initiative.

In this connection, the CSSR foreign minister pointed to the moral obligations of the "spirit of Geneva" to "rise above the tactical calculations of the general staffs." Genscher replied that the aim was "to prevent the arms race in space and to end it on earth."

PRESS RELEASE ON 4-6 FEB LIBYAN PRODUCERS VISIT

AU070958 Prague PRACE in Czech 6 Feb 86 p 3

[CTK Report: "Press Release on the Sojourn of a Delegation of the General Congress of Producers of the Socialist People's Libyan Arab Jamahiriyah"]

[Text] Prague (CTK)--A three-member delegation of the General Congress of Producers of the Socialist People's Libyan Arab Jamahiriya, led by Secretary Ali Faraj al-Gabsi [spelling as published], on 4-6 February paid a visit to Czechoslovakia at the invitation of the Central Trade Union Council [URO]. For the Czechoslovak side, talks with the Libyan guests were conducted by URO Secretary Viliam Kozik and by Emil Gorchol, head of URO's International Department.

During their talks, the representatives of the two organizations briefed one another about the most important tasks of the trade union movement in their two countries, assessed the cooperation to date, the positively developing relations, and affirmed the interest in strengthening and deepening them further.

When assessing the current international situation, the representatives of the Czechoslovak and Libyan trade unions paid exceptional attention, in particular, to the situation in the Middle East. They expressed strong alarm over the escalation of tension in the area, especially over the gross provocations directed against the independence and sovereignty of Arab countries. In this connection, they sharply condemned the continuing preparations of the United States and Israel for an armed aggression against the Libyan Jamahiriyah--above all the continuing provocations off the Libyan coast--and other forms of pressure on that Arab country, including air piracy and state terrorism, proof of which was also the recent airjacking of a Libyan civilian aircraft by the Israeli Air Force, carried out with direct U.S. support. They resolutely demanded an immediate halt to these provocations which constitute a grave danger to all states in that region and to world peace.

In this connection, the two sides depicted efforts aimed at maintaining peace and averting nuclear catastrophe as the fundamental question of mankind's future. They fully supported the principled policy of the USSR and the other socialist countries aimed at eliminating dangerous hotbeds of international tension, halting the arms buildup, and at peaceful cooperation in outer space. They, in particular underscored and expressed unequivocal support for the exceptionally weighty initiatives of the Soviet Union, contained in the statement of CPSU Central Committee General Secretary Mikhail Gorbachev of 15 January 1986, whose essence is to rid the world of nuclear and chemical weapons by the end of the century, and substantially limit the current volume of conventional weapons and armed forces.

The representatives of URO and the General Congress of Producers affirmed their solidarity with the struggle of all progressive and revolutionary forces in Asia, Africa, and Latin America against imperialism, neocolonialims, Zionism, and apartheid, against the policy of monopolies and all forms of exploitation of man by man. They favored the liquidation of dangerous hotbeds of international tension in the world and a just settlement of conflicts on the basis of an unconditional right of nations to a free path of their development and noninterference in internal affairs.

At the end of the talks, the two sides expressed full satisfaction with the course and the results of the visit. The Libyan delegation expressed thanks for the hospitality and friendly reception accorded to it in Czechoslovakia.

OMISSIONS, FAILURES OF IDEOLOGY FRONT SCORED

AU121224 Bratislava PRAVDA in Slovak 10 Feb 86 p 1

[Editorial: "Socialist Conviction"--Uppercased words published in wide-spaced type]

[Excerpts] The shaping of socialist awareness and conviction, which is the integrating nucleus of the socialist way of life, represents an unusually complicated process that is full of internal contradictions. This fact has been confirmed by the entire practice of building socialism so far. Now, in the period of building a developed socialist society, it is getting into the focus of our interest with new urgency.

In this connection, we would like to look at one problem, the incorrect perception of which brings about stagnation, and sometimes even defeatist attitudes, in an area of such importance as ideological influence, ideo-educational work.

For a relatively long time already, we have felt the essential need to radically raise the overall standards and quality of ideological work, and, consequencly, to raise its efficiency and flexibility. Let us recall what the CPSU Central Committee session of June 1983 had to say about this problem: "Our entire ideological, educational, and propaganda work must be resolutely raised to the level of the grand and complex tasks which the party tackles in perfecting developed socialism.... We see clearly what grave damage is caused by shortcomings in this work.... On the other, we feel exactly even now how advancement accelerates when ideological work becomes more effective, when the masses arrive at a better understanding of the party's policy and identify with it because it corresponds to people's basic interests."

We rightly note that many positive results have been achieved lately due to the activation of the ideological front. The quality and effectiveness of ideological influence have improved. But let us ask: Is this true of the ENTIRE system, of ALL its components?

Let us look, for example, at the quality of results and the level reached in party education. Are ALL the advantages and potentials of the current system of party education being utilized?

We believe that far greater attention must be paid to individual subdivisions and to their genuine links with practical life. Transition must also be made from solving global, general problems to those of specific nature. We must not indulge in "solving" problems that have already been resolved--or, to be more accurate, about which we are clear in principle--at the expense of real and frequently very burning problems. In other words, we must step from heights down to earth, improve the quality of ideo-educational work, and raise its impact on the convictions and deeds of individuals, We must examine to what degree individuals, that is, specific people, are capable of approaching the solution of problems in a dynamic way, in accordance with the requirements of present times. This means nothing else than that we must examine with the necessary headstart the extent of their ability to predict and "overtake" developments.

Or let us look at another important area of ideo-educational work--the professional and political training, education, and upbringing of young people at the institutions of higher learning. Virtually every deliberation of communists at CPSL members' meetings and conferences in the educational sector and at the institutions of higher learning in particular, has drawn attention to the formidable and LONG-LASTING disproportion between the students' educational level and the crystallization of their world outlook. Time and again we come across the discovery that young people are capable of acquiring a certain sum of knowledge, propositions, and tenets but are no longer capable of translating them into active viewpoints and standpoints and of applying them in dealing with everyday problems. They have not become the cornerstones of their conviction and an impetus and criterion for their conduct.

This is not a problem or deficiency that concerns the institutions of higher learning alone. The fact is, however, that this is where the entire process of shaping one's world outlook culminates. That is we must not endlessly merely note the existence of problems, but must SOLVE them radically and expeditiously.

Frequently, one can also hear an incorrect interpretation of the proposition that the shaping of socialist awareness and conviction is a long-term process. The fact that the result of ideo-educational work is not manifested immediately, overnight, that this work requires a maximum degree of patience, that it is arduous work, and so forth, cannot and must not serve as a justification for those who have for a long time been achieving in it no or only scant results.

In shaping socialist conviction, considerable untapped potentials also exist in mass-political work. We still forget the forcefulness and persuasiveness of direct, authentic and nonanonymous agitation.

We also cannot fail to notice the fact that some ranking employees who are party members seem to consider it almost their duty when charged with an economic function to de-politicize the manner of their thinking, acting, and doing things. It is as though they viewed ideology or politics as an obstacle to, rather than as one of the most important means and prerequisites for, the fulfillment of economic tasks. They leave ideological and ideo-educational work to "others" and lose touch with primary party organizations.

CPCZ LEADERS ATTEND REGIONAL PARTY CONFERENCES

LD151216 Prague Domestic Service in Czech and Slovak 0900 GMT 15 Feb 86

[Excerpts] Regional and city party conferences marking the beginning of the closing stage of preparation for the 17th CPCZ Congress began today in 10 regions of the CSSR and in Prague and Bratislava. Stansilav Benda reports on the conferences:

Taking part in this important political event in the life of the party and the whole of society are delegations of the CPCZ Central Committee. The delegation to the city conference in Prague is headed by Gustav Husak, general secretary of the party's Central Committee. Other members of the CPCZ Central Committee Presidium head the following delegations: Lubomir Strougal in the North Moravian region, Vasil Bilak in the West Slovak region, Peter Colotka in the East Slovak region, Karel Hoffmann in the West Bohemian region, Alois Indra in the East Bohemian region, Milos Jakes in the Central Bohemian region, Josef Kempny in the South Bohemian region, Josef Korcak in the South Moravian region, and Jozef Lenart in the Central Slovak region. Candidate members of the party's Central Committee Presidium head delegations as follows: Jan Fojtik in the North Bohemian region and Miloslav Hruskovic in Bratislava.

INDRA MEETS WITH BRAZILIAN CONGRESSIONAL DELEGATION

LD172108 Prague Domestic Service in Czech and Slovak 1300 GMT 17 Feb 86

[Text] Alois Indra, chairman of the Federal Assembly, today received the delegation from the Brazilian Congress headed by Jose Fragelli, its president, which is in the CSSR on an official visit. He briefed the guests on the results achieved in building socialism in the CSSR over the past 40 years and about the development of work initiative before the coming 17th CPCZ Congress and the elections to the representative bodies. Afterward he explained the principal stands the CSSR takes in regard to some international political problems and stressed that our country strives to strengthen peace and to resolve all contentious issued by negotiations. He singled out the principled USSR peace policy and the importance of the comprehensive proposals submitted by Mikhail Gorbachev. Alois Indra described CSSR-Brazilian relations as traditionally constructive and friendly in which economic cooperation has always been predominant and which can be developed intensively further. At the close Alois Indra voiced the conviction that the delegation's visit to our country will contribute to further strengthening contacts between Brazil and the CSSR in all areas.

Dalibor Hanes, chairman of the Chamber of Nations, then explained to the Brazilian parliamentarians the status of the Federal Assembly and the future tasks facing it.

Jose Fragelli, president of the Brazilian Congress, then spoke about the situation in his country where a civilian government has taken power after a long time and about the preparations for elections to a new parliament. He said that Brazil, which now stands on the threshold of profound sociopolitical changes, works actively to strengthen peace, supports the right of nations to self-determination, and the principle of resolving all conflicts by negotiations. He voiced the conviction that there exist good prerequisites for further intensifying mutually beneficial cooperation between both countries, especially in the economic area. Such cooperation contributes to mutual understanding and to reinforcing trust.

CHARTER 77 CALLS FOR CSSR-WEST PRISONER EXCHANGE

AU172047 Paris AFP in English 2042 GMT 18 Feb 86

[Text] Prague, 17 February (AFP)--Charter 77, Czechsolovakia's main dissident movement, has called on six Western governments to hand over convicted East Bloc spies in exchange for six detainees in Czechoslovakia, a communique issued here today said.

The communique was distributed by the Committee for the Defense of Persons Unjustly Persecuted (VONS), and said the proposal had been submitted to the Czechoslovak Government and ambassadors from France, West Germany, the Netherlands, Austria, Britain and the United States.

It was signed by Charter 77 spokesmen Anna Sabatova, Martin Palus, Jan Stern and Ladislav Lis, vice-president of the Paris-based International Federation for the Rights of Man.

The appeal followed last week's spy exchange between East and West, in which Jewish Soviet dissident Anatoliy Shcharanskiy and several convicted spies from both sides, including Czechoslovak Jaroslav Javorskiy, were freed.

Charter 77, a human rights group formed in 1977, said the exchange had given hope that "other Czecholsovak citizens, sentenced to long years in prison, could be freed."

It added that "the idea of such an exchange is all the more urgent because these people resolutely deny their guilt and there is nothing to indicate that they committed espionage."

Four of the six detainees were convicted of spying. VONS named them as Jiri Gans, 57, sentenced in 1977 to 15 years and said to be in a "very critical" state of health, Petr Hauptman, 40, sentenced to 10 years in 1984, Josef RoMer, 31, serving an 11 year term imposed in 1978, and Fratisek Veis, 54, a signatory of the Charter 77 manifesto, given 12 years in 1979.

Two dissidents named were Jiri Wold, 33, and Walter Kania, 46, both Charter 77 signatories, who still have 4 and 2 1/2 years of their sentence to serve respectively.

All six had asked to emigrate, VONS added.

EUROPEAN CULTURAL FORUM SUMMED UP

Prague RUDE PRAVO in Czech 4 Dec 85 p 5

[Article by Ilja Hulinsky, Ambassador and Permanent Deputy Representative of the Czechoslovak delegation to the Cultural Forum of the Helsinki Final Act's signatory countries in Budapest]

[Text] Following a decision by the Madrid Review Conference on European Security and Cooperation, a cultural forum of the Helsinki Final Act's signatory countries was held in Budapest between 15 October and 25 November 1985. The forum began its deliberations at a time of complicated international situation and of the final preparations for the summit meeting between the Soviet and American leaders. The West and especially the United States had tried very hard to inject East-West ideological problems into interstate relations. This was also reflected in the deliberations of the Cultural Forum whose mandate--namely, the discussion of the interrelated problems of creative work, dissemination and cooperation in various cultural fields--was closely linked to issues on which the member-countries of the Commission on European Security and Cooperation, belonging to different social systems, have different opinions of a basic ideological nature.

The final stage of the cultural forum was significantly influenced by the results of the Geneva meeting between Mikhail Gorbachev and Ronald Reagan strengthening the realism of most delegations participating in the forum and their efforts at having good will reflected there, too, paralleling the direction agreed upon in Geneva.

Most of the participating countries dispatched to Budapest large delegations made up of prominent personalities representing all cultural areas and whose problems were on the forum's agenda. But it was primarily the delegations of the socialist countries made up of the leading representatives of the artistic and cultural world who were known universally through their work. As a result of the high intellectual level of their speeches and their pragmatic and constructive approach, they achieved approval and recognition among their counterparts in all four working organs of the forum on issues of creative art, dramatic art, literature, and mutual cultural relations.

During the 6-week deliberations of the cultural forum, its participants could analyze the profile of European culture which reflects in its broad variety the life and fate of the contemporary world. The profile is not always upbeat or care-free but offers hope.

It was a lucky coincidence that the cultural forum concluded its deliberations immediately after the revival of the Soviet-American dialogue at the summit concerning the survival or annihilation of human civilization. Following the Geneva summit, the world has become a safer place. Mikhail Gorbachev's words at his press conference of 21 November 1985 were also addressed to the participants of the Cultural Forum. To a question of whether this is also the time to re-examine prejudices in mutual relations between countries with different social systems, Mr Gorbachev answered: "Don't blame political leaders for everything. We have agreed to expand cultural contacts. Thus, you should meet and negotiate among yourselves." It is necessary to follow up this advice in the spirit of Geneva, and the spirit of Geneva means learning to live together.

In the last few weeks, the participants in the cultural forum also witnessed periods which demonstrated how difficult is the road to understanding. The variety of views evidenced the differing socialist realities of the participating countries, their different ideological approaches being also evidenced in their cultural policies. The Czechoslovak delegation went to the deliberations at the cultural forum in full awareness of its responsibility regarding Czechoslovakia's pledges made in the Helsinki Final Act whereby its signatories expressed their readiness to convert detente into a continuous, vital, multifacted, and as far as its scope is concerned, universal process. This also corresponds to the historical traditions and the humanistic, peaceful, and progressive cultural role of contemporary Czechoslovakia. Such sense of responsibility obliged the Czechoslovak delegation, made up of the most prominent personalities in our cultural life, to consider constructively the mutually interlinked questions of creative work and the dissemination and exchange of cultural resources. As stated at the concluding meeting on the cultural forum, the Czechoslovak Socialist Republic, too, will continue to do everything to help the development of a peaceful European community of national cultures. This will be our contribution to a joint effort by the forces of realism to create on our continent a sophisticated and effective system of collective security and cooperation.

Collective security in Europe can be created by a system of agreements on interstate relations while observing all the principles of peaceful coexistence listed in the Helsinki Final Act. It covers cooperation in every sector of the Helsinki process but rejects mutual interference in domestic affairs.

The uniqueness of the Budapest Cultural Forum, often referred to in the speeches made there, does not lie in the fact, or only in the fact, that the forum was attented by prominent cultural personalities. International meetings have a great impact on world public opinion. Rather, the uniqueness of the Budapest Cultural Forum resided primarily in the fact that this meeting was to help revitalize efforts for the relaxation of tensions as a preliminary step away from a world saturated with weapons in the direction of a reliable system of agreements on international security. This was the first meeting of its kind in the history of Europe as far as the Forum's scope and content are concerned. One must recall that the governments of all the 35 signatory states of the Helsinki Final Act were represented by delegations consisting of people prominent in the cultural world.

Apart from the fact that because of the fault of several Western delegations no final document was approved, one can consider as a great achievement of the cultural forum that its participants, functioning in an atmosphere of intensive dialogue, were able to seek and identify issues of common interest which are important for the development of European culture and to propose, too, a series of very concrete and often new forms of improved cooperation in the cultural field among the countries involved in the Helsinki process.

The outcome of the cultural forum is therefore a plea addressed to the governments of the signatory countries of the Helsinki Final Act not to allow the dynamic goal to turn into a dead letter but contrariwise to revive the jointly discovered rhetoric through concrete deeds. The significance of the cultural forum has, however, one additional dimension which was obvious during all its deliberations: The awareness that the artists and cultural workers are also the bearers of historic responsibility for the fate of peace and progress, for preserving the cultural heritage of mankind. The real outcome of the cultural forum thus moves in the direction of a brighter future opened by the historic summit in Geneva.

In this sense the Budapest Forum will, in the last analysis, become one in a series of steps contributing to the fact that culture can enrich the life of each and every individual. Culture can, in its national diversity and despite ideological differences, become a force igniting the flame of understanding which will protect peace, progress, and improve mutual respect among nations.

Knowing that it was striving for a worthy cause, the Czechoslovak delegation as a group and each and every one of its members fulfilled with flying colors the tasks assigned to them when they arrived in Budapest and were among the most active and innovative participants.

BRIEFS

CSSR-ALGERIAN COOPERATION TALKS--Prague, 14 February (CTK)--New forms of cooperation, especially in industry, will develop between Czechoslovakia and Algeria, the Czechoslovak-Algerian Committee for Economic and Scientific-Technological Cooperation agreed at its eighth session which ended here today. A protocol was signed by Czechoslovak Foreign Trade Minister Bohumil Urban and Algerian Minister of Heavy Industry Salim Saadi at the close of the session. The committee discussed extension of goods exchange. An emphasis was put on an increase in Czechoslovak exports, mainly in engineering, and commodities which can be imported for the Czechoslovak national economy were selected. The talks confirmed the possibilities of Czechoslovakia's participation in the construction of complete plants in Algeria, such as mills, a ceramic works, foundries and forges. Talks will also continue on other forms of Czechoslovakia's share in the process of industrialization in Algeria. The sphere of scientific-technological cooperation was highly praised. The present number of 380 Czechoslovak experts working in Algeria should further increase in the coming period. [Text] [Prague CTK in English 1641 GMT 14 Feb 86 LD] /12232

REGIONAL LEADERS RETAIN POSITIONS--Prague, 18 February (AFP)--The Czechoslovak Communist Party's regional conferences have ended with all top officials, most of them appointed after the "Prague spring" of 1968, still in place. The conferences were held as curtain raisers to the 17th Party Congress, due to open here 24 March, and indicated that the existing party leaders would remain firmly in command. However, there could be changes among lower level officials, who have been the object of an intense campaign calling for the "normalization" of communists. Several have been expelled from the party for fraud in recent months, the most prominent being Frantisek Neuhauser, director of the uranium mines in central Bohemia, and his assistant Frantisek Riger, who built second homes at the mine's expense. FERFECKY'S FUNERAL--The funeral took place today in the great hall of the Strasnice Crematorium in Prague of Hero of Socialist Labor Otakar Ferfecky, the federal government's commissioner for the construction of the Prague Metro, bearer of the Order of Victorious February, and the Order of Labor. Present at the funeral ceremony, together with the deceased's family, were Ludomir Strougal, the federal premier, and Josef Korcak, Czech prime minister, members of the Presidium of the CPCZ Central Committee; and other representatives of our political, economic and public life. Zdenek Smely, first deputy chairman of the Czech Research and Development and Investment Planning Commission, in a speech, paid tribute to the lifelong work of Otakar Ferfecky, who devoted all his work and organizational talents to our people and our socialist society. He stressed that his name will forever remain linked with important socialist construction projects as the Prague Metro, the renovation of the National Theater, and important industrial enterprises, hospitals, and many other others. CC INTERVENES IN IDEOLOGICAL CONTROVERSY OVER SCHOOL TEXT

Background of Controversy

Budapest UJ TUKOR in Hungarian 17 Nov 85 pp 18-19

[Article by Erno Balogh: "The Lessons of a Debate"; last paragraph is UJ TUKOR comment]

[Text] In recent months there has been a very lively debate, occasionally even heated and acrimonious, over the publication this year of the second volume of the history of literature textbook for fourth-year gimnazium students. The volume is intended as an introduction to the more important trends in the post-1945 Hungarian and foreign literature, to the biographies of the poets and writers, and to the outstanding works that have been written in recent decades and hold promise of lasting value. To indicate that some types of problems which have flared up now are not of recent origin, the widening controversy touched also on the earlier volumes in the new series of textbooks which, according to the critical comments, likewise require revision. The debate was conducted mostly in the columns of UJ TUKOR. A comprehensive critical review of the debate appeared in the June issue of KRITIKA. And some of the contributors to the nearly six-month-long exchange of views (beginning with Istvan Kiraly) in MAGYAR IFJUSAG, on the present contradictions and problems of teaching literature, also joined in the debate, although only indirectly. A roundtable that appeared in the No 7, 1985 issue of PARTELET ("What Does Art Policy Support?") referred emphatically to the textbook's shortcomings.

It should be noted, and not merely as a matter of curiosity, that LUDAS MATYI also responded to the debate in its own way: its humorous cartoon "commentary" attests to the fact that the topic soon outgrew the confines of cultural life --and within it, of education as the profession most directly involved--and attracted wide general attention. And justifiably so, because no responsible thinking person can remain indifferent to what perspective an official textbook reflects, to what scale of values it sets, and to what influence--by no means negligible--it exerts on the students' behavior, world outlook and tastes.

The critiques appearing in the press have raised professional questions in a narrower sense, and questions of ideology and educational policy as well. The nature of these problems, and the self-understood public interest in this sphere of education and training, necessitated the earliest possible clarification of the problems, and the formulation of the tasks stemming from them.

Therefore the Educational Policy Working Group attached to the MSZMP Central Committee sponsored a conference to which it invited--in addition to those of its members who are interested in the topic, or are most likely to encounter it in their own professions--the following: the textbook's author, several of the publisher's readers, the contributors to the debate in the press, and the head of every state institution concerned. Because the debate had extended in part also to some of the earlier volumes, several of their authors were present as well. The conference's primary objective was to provide assistance for the textbooks' suitable, professionaly and ideologically authoritative, revision, and thereby to contribute toward the solution of the present problems in conjunction with literature instruction in secondary schools. As one of the essential conditions for the elimination of the substantive problems that have arisen, another objective of the conference--specifically in the interest of the mentioned primary objective's more effective realization--was to reach a possible and necessary consensus on the principles of educational policy regarding several of the more significant questions.

In the following I will attempt to briefly highlight some of the debate's more general lessons, which will not be without interest even to the wider party membership. To avoid any misunderstandings, I wish to point out in advance that what follows is neither an abstract of the minutes of the meeting that recorded the lengthy exchange of views at the all-day conference, nor some "official" party standpoint. And under no circumstances does it claim for itself the right to have the last say. This writing cannot undertake at all to present the entire range of arguments and ideas that were advanced, and of the questions decided or left open in the debate. Within the contributions to the debate, it wishes to call attention primarily to those elements which--in my opinion--could serve as the basis for realistic further progress and are most likely to contribute toward formulating a policy platform that is indispensable to joint action. In addition to providing information and presenting the points of view that are more general (and in part may therefore offer lessons for other areas as well), then, this endeavor is the other, more specific, objective of this writing.

It was strongly emphasized in the debate that literature textbooks must perform several functions. They must contain, for example, the theoretical knowledge essential to an understanding of literature; present the biographies of significant authors; introduce the literary works of lasting value; help to develop the habit of reading and love for the arts in general; participate in moral and aesthetic training, in improving the perception of reality and self-comprehension, etc. In addition, literature textbooks must be in harmony with the principles of our social system, its scale of values, and its comprehensive public objectives. Moreover, they must present our ideals convincingly, with effective arguments. The characterization of literary works and trends must be based on the Marxist world outlook, and on the set of aesthetic values derived from it. This criterion--in the case of textbooks written for use in public education, and prepared, approved and published by state institutions--is hardly debatable. Of course, Marxist scientists and experts also differ in their views on a good many questions, and therefore it is not always easy to determine which of the views is the authentic one. But if we look at the fate of these textbooks, this much is certain: When the differences of opinion are as wide as they sometimes have been in the course of this debate, the exchanges of views that clarify the differences (and involve hard work, of course) should not have been spared. If we consider the consequences, a shortage of time is not an acceptable excuse worthy of consideration.

A further basic requirement is that the various areas of educational policy unconditionally be synchronized on essential issues, if the Ministry of Culture and Education wants to be consistent and retain its credibility. Specifically, a textbook's views regarding aesthetic value on the one hand, and art policy's subsidization strategy, which is implemented in different ways through a variety of means, and its set of principles on the other hand, must not differ from each other, and especially must not be in conflict. If the difference between them becomes significant, sooner or later it will be the source of serious disturbances. Or to be even more specific: if realism as a modern and comprehensively defined scientific category of aesthetics and philosophy unalterably retains its eminent and authoritative position in art policy's evaluation mechanism and theoretical underpinnings, then we can hardly regard as acceptable a textbook which for the most part recognizes this concept's meaning only in the sense in which it is used in the history of style (and is applicable therefore mainly to 19th century literature), or which conveys--through its negative declarations--only the one-time, conservative, meaning of realism. If educational policy is urging the liveliest possible integration and ever-wider dissemination of Gyorgy Lukacs's monumental lifework and outstanding intellectual legacy (as this is evident, among other things, also from the Educational Policy Working Group's document entitled "Guidelines for the Centennial of Gyorgy Lukacs's Birth"), then we can hardly regard as acceptable that part of the literature textbook which feels compelled to single out from the wide-ranging writings of one of the greatest philosophers of the 20th century primarily the theory of realism which he developed in the 1930's, and which was subsequently modified to a significant extent. As the standpoint of the aforementioned working group points out with due emphasis, Gyorgy Lukacs "has described and explored, with lasting and now once again timely validity, many of the essential features of the philosophical trends of the 19th and 20th centuries, of modern irrationalism: the obscurantism, the unhistorical creation of myths, the religious atheism, the indirect apologetics, the willy-nilly confirmation of despondency and hopelessness, the life philosophy of despair." The bias of the fourth-year gimnazium students' literature textbook--evident in that it ignores the importance of Lukacs's lifework in philosophy and aesthetics, but simultaneously revalues upward and accepts for the most part without criticism the existentialist philosophies of the 20th century, and Heidegger's work in particular--can be reconciled neither with the spirit of the aforementioned standpoint, nor with the principles and aspirations of educational policy. Of course, the statements contained in any party document must not be regarded rigidly as dogma, and one may also challenge them. However, textbooks are not the proper forum for a possible retrial. But let us take the question of bias one step further: It has been for some time the established policy of the Ministry of Culture and Education to support the assertion of a variety of values. As evident from the proportions of allotted space and content, however, the second volume of the literature textbook for fourth-year gimnazium students partially circumvents this practice, by giving preference mostly to a single (the bourgeois humanistic) trend in the Hungarian and foreign literature.

There is considerable emphasis in the textbook on the various crisis phenomena in today's world, on the examples of the threats to human existence, of the defenselessness of nature and society, and the possible scenarios of tragedy. Obviously, the dominance of a perspective attempting to interpret literature's processes in the spirit of an absence of conflicts, of one-sided and naive optimism, could also cause serious harm and produce an effect contrary to our objectives. Therefore the fact in itself is not objectionable, but indeed natural, that the truly serious problems of today, the disturbing alternatives, and the inevitable tragic turns in man's life are reflected also in the textbook, and thus it does not create illusions and foster unrealizable hopes. The communist movement, too, knows from bitter experience that attempts to conceal or ideologically embellish the truth, to present aspirations as actual facts, will always rebound many times over: they lead to discord, produce disenchantment, and might spread nihilism. But the presentation of the forces countering the threat to mankind, the worthy analysis of their representatives in the leftist, socialist literature, and the drawing of outlook-shaping and behavior-forming consequences from them are conspicuously absent from the textbook. In its overall impact, therefore, the volume might produce a disarming and paralyzing sense of hopelessness and inevitability, as a miscalculation of a conceptual nature. Whereas a literature textbook--remaining completely in harmony with the peculiarities and internal laws of its subject--ought to be both morally and emotionally able to present the existing humane prospects, respectively to argue in favor of their active acceptance. This appealing and meaningful opportunity must not be lost; without its realization, the textbook could not possibly fulfill its intended purpose.

Several contributors to the debate have raised the question as to whether it is possible, or at all expedient, to present in traditional textbook form--with its typical organization, selection of material, stricter evaluation obligations, etc.--the literature of today in its constantly changing trends, and the creative careers not yet over and therefore necessarily liable to change. For here the danger of haphazardness, disproportions, and subjective preferences is objectively much greater; because the historical perspective is lacking that excludes practically from the outset the possibility of grave errors in the case of earlier periods. Today nobody would seriously question that Shakespeare, for example, is a figure of decisive importance in the literature of his period and in the entire world literature since then. But assessment of some of the authors of our time is necessarily frought with uncertainty; the critics are more divided in their views; and also the risk of yielding to the temptations of fashionable trends is greater. Therefore some of the contributors to the debate supported the standpoint, and not unfoundedly also in my opinion, that a textbook in the conventional sense is unnecessary to teach contemporary literature. Instead, a volume of selections ought to be compiled that contains the texts of (or excerpts from) works which professional public opinion, Marxist literary criticism, has judged as significant; together with the authors' more important biographic data and the most essential factual information.

The important topics on which views were exchanged included the range of questions concerning the relationship today between traditions and modernness, and the substantive determinacy of this relationship. The view was expressed that Hungarian literature has undergone radical changes in recent years, and that

--due to the transformation of the scale of values--the artistic endeavors which are more receptive to social problems, and which regard creative work as service to the people and the nation, a commitment to public affairs, have actually become outdated. I personally support the opposite view, the one which holds that, in spite of the undeniable changes, this trend of our literature with its outstanding traditions is not anachronistic even today; that it is still producing works of significant value which are best-sellers or box-office successes; and that its continuity will not cease even in the future, because several gifted representatives of the younger generation are joining this trend. Consequently, I too believe that the role the textbook assigns to this extremely typical branch of our literature is smaller than what it merits. Because, in comparison with the literatures of other nations, this branch of our literature provides its phylogenetic specialty, its characteristic plus and special appeal.

When listing the functions that a textbook must perform, I have already referred to the requirement of helping to develop the love of books and the habit of reading, and of contributing thereby to the all-round development of the individual. But this function ought to be stressed also separately. Because I am convinced that this educational role and vocation should have received greater emphasis in the volumes in question. As emphatically expressed in the debate, this educational role assumes special significance today when the social prestige of literature, of the arts and of the humanities in general, is declining, contrary to our intentions and in spite of our efforts; when there are so few truly regular readers; and when there is growing interest in light reading, including pulp of low quality. Textbooks must help to effectively assert this educational role by every means: through their tone, selection criteria, analyses, and thesaurus of concepts. This is our most fundamental common interest and the responsibility of every one of us, independently of the debate. For it is indisputable that the arts, including literature with its greatest traditions in our country, play a unique role in the realization of our social objectives, and in making our lives more humane and meaningful, as this has been pointed out in an entire series of documents on educational policy.

In the final outcome, every participant in the debate covering numerous fundamental questions of our educational policy agreed that the textbooks for fourth-year gimnazium students require substantive revisions, and there were actual differences of opinion among them primarily on the extent of the necessary revisions and the proportions of the shortcomings. None of the conferees questioned the fact that the volumes, in comparison with the previous textbooks, have indisputable merits and are serious intellectual efforts of high quality within their own field. Several speakers pointed out that the textbooks are attempting to cling to aesthetical values more consistently than the previous textbooks did. And the disproportions, the problems of approach, the one-sided applications of the principle of quality are by no means shortcomings for which solely the author can and should be blamed.

However, there can likewise be no doubt that an entire chain of mistakes, omissions and superficialities led to where the teaching of literature found itself in a difficult situation, and it finally became necessary to hold such a debate about a published textbook in actual use, which unavoidably offended also various personal sensibilities. Had every one of the institutions concerned exercised the degree of circumspection required--and on the basis of the early indications, their circumspection should have been commensurately greater--we could have avoided much inconvenience and many conflicts.

This is one of the most important lessons to be drawn from the debate. Yet another lesson is that the debate has demonstrated that we do have the intellectual potential with whose help we are able to present our reality, our contemporary literature, accurately and in the Marxist manner. In future we must rely on these forces more effectively and in a better coordinated manner. Because that way we will be able uphold our ideals more convincingly, in a better substantiated and more nuanced manner, also in the exceptionally important area of educating our youth.

We have reprinted the above article from the November issue of PARTELET. Not to rekindle the debate, of course. To the contrary. Our purpose is to inform our readers, who have been able to follow--over a period of more than 2.5 months this summer--our articles on literature textbooks for gimanazium students, that the meaningful revision of the textbooks has begun. Editors.

Abstract of Balogh Article

Budapest NEPSZABADSAG in Hungarian 25 Nov 85 p 7

[Abstract, in the "Perusal" rubric, of article by Erno Balogh: "The Lessons of a Debate"]

[Text] Published this year, the second volume of the literature textbook for fourth-year gimnazium students--it covers the post-1945 Hungarian and foreign literature--rekindled the debate on literature textbooks that has been going on for several years. The articles contributing to the debate, published in various newspapers and journals, have raised a series of professional and ideological questions. To help clarify the problems and outline the tasks, the Educational Policy Working Group attached to the MSZMP Central Committee held a conference to which every person and institution concerned had been invited, in addition to the working group's members. The objective of the conference was to provide assistance for the suitable, professional and ideological revision of textbooks.

The author of the article reporting on this conference points out that the many diverse functions of literature textbooks must be in harmony with the ideals of our social system. The assessment of authors, their works and literary trends must be based on the Marxist world outlook and performed with the help of Marxist aesthetics. "This criterion--in the case of textbooks written for use in public education, and prepared, approved and published by state institutions--is hardly debatable." Naturally, the standpoints of Marxist experts are not unanimous on every question. But when the differences of opinion are as wide as in this case, it would have been not only more fortunate but also more responsible to clarify the problems before the textbook's publication. Only in this way could we have avoided a conflict between the textbook's views regarding aesthetic values on the one hand, and education policy's set of principles on the other. A cultural policy which assigns an eminent role to realism as a modern and comprehensively defined scientific category of aesthetics and philosophy is hardly able to accept a textbook that recognizes, almost ostentatiously, only the 19th-century, conservative, history-of-style meaning of realism. And it is likewise not entirely compatible with the principles of our cultural policy that the textbook ignores, among others, Gyorgy Lukacs's very important and influential writings concentrating on developing the theory of realism and on opposing irrationalism, but revalues upward the bourgeois philosophies of the 20th century, and Heidegger's work in particular. The textbook's antidogmatism, instead of its attempt to present the diversity of aesthetic values, does not particularly help the realization of our cultural policy objectives, either.

In itself the fact that the textbook places great emphasis on today's crisis phenomena, worries, problems, and possible scenarios of tragedy is not objectionable. What the textbook's critics are demanding of it is not naive optimism, but the proportional presentation of the forces countering the threat to mankind. Actually it is also a literature textbook's pedagogical duty to present the existing humane prospects, in contrast with the hopelessness. But the question arises as to whether it is at all expedient to present contemporary literature in traditional textbook form, because the possibility of subjective bias and the danger of disproportions in the assessment of contemporary literature are much greater to begin with. In the opinion of some of the contributors to the debate, ". . . a textbook in the conventional sense is unnecessary to teach contemporary literature. Instead, a volume of selections ought to be compiled that contains the texts of (or excerpts from) works professional public opinion, Marxist literary criticism, has judged to be significant; together with the authors' more important biographic data and the most essential factual information."

The author of the article establishes that the debate covered many fundamental questions of our educational policy. The conferees agreed that the literature textbooks require revisions. There were actual differences of opinion among them only on the extent of the necessary revisions and the proportions of the shortcomings. Nobody at the conference doubted that these textbooks are better than the ones they have replaced. And it is likewise certain that the mentioned disproportions and problems of approach are not solely the author's fault. ". . .an entire chain of mistakes, omissions and superficialities led to where the teaching of literature found itself in a difficult situation, and it finally became necessary to hold such a debate about a published textbook in actual use, which unavoidably offended also various personal sensibilities. Had every one of the institutions concerned exercised the degree of circumspection required--and on the basis of the early indications, their circumspection should have been commensurately greater--we could have avoided much inconvenience and many conflicts." (From PARTELET, November 1985)

POLISH OFFICIAL ON COMBATING ALCOHOLISM

PM121131 Gdansk DZIENNIK BALTYCKI in Polish 7 Jan 86 p 3

/Interview with Jozef Bury, vice minister of labor, wages, and social affairs, presidium member in the Commission for Countering Alcoholism, by KAR correspondent Irena Scholl; date and place not given; passages in slantlines published in boldface/

/Text/ Scholl: An investigation conducted by the Supreme Chamber of Control, the Ministry of Labor, Wages, and Social Affairs, as well as employment departments of voivodship offices and Citizen's Militia shows that the act on temperance education and prevention of alcoholism is not being observed. The most alarming thing is that, instead of dying out, the custom of drinking in the workplace is becoming entrenched.

Bury: True. The number of employees who attempt to enter their workplaces while under the influence of alcohol is by no means declining. Attempts to bring alochol to work are made with increasing regularity and, unfortunately, they are often successful. People drink in changing rooms and in storerooms. Whereas during the first half of 1983 more than 9,000 people were caught at those practices, in the first quarter of 1985 there were already 14,000 known cases. The number of persons guilty of disturbing the peace in workplaces has more than doubled....

Scholl: What causes this?

Bury: Experts point to six main causes here. /Tradition/--No occasion of any consequence, no social or family gathering, no reunion or other celebration among colleagues can take place without drinking alcohol. /Frustration/--caused by chronically poor living conditions, lack of prospects for quick stabilization, such as being able to get a home of one's own, buy a car, take an attractive vacation abroad, and so on. /Stress/--brought about by disturbances affecting regular pace of production, work stoppages, shortage of materials, lack of tools in good working order, and insufficient motivation for improving productivity. /Family problems/ caused by a variety of reasons, feelings of loneliness and social alienation. /Disintegration of social life/, because there is no time for it, because housing conditions and market supply are inadequate, and because going out is very expensive. What we have left is a poor substitute: secret drinking with colleagues in some hidden corner of the workplace, "chasing" the alcohol with a coffee, gherkin, or a mouthful of black pudding. Finally, there is the /availability/ of alcohol in contrast to the shortage of other goods that might otherwise effectively compete with it.

Scholl: What is the greatest obstacle to removing alcohol from the life of the workplace?

Bury: Poor sense of work discipline. Other symptoms of this are high absenteeism, poor work organization, little appreciation of the value of work, and, consequently, low output quality. Obviously, these ills do not affect all our enterprises and all our workforce, but they still leave a deep imprint on our life.

Scholl: Who has enough decisive influence to change this state of affairs?

Bury: Everybody. Enterprise managers, sociopolitical organizations, and the trade unions--which have not, as yet, declared any resolute struggle against alcoholism in the workplace. And we cannot eliminate this phenomenon without first increasing people's awareness, without raising our workforce's standards regarding each individual's attitude toward the work ethic and discipline.

Scholl: How can we fight it more effective? Let us begin with the practice of bringing vodka to the workplace. Are the existing methods of stopping this really effective?

Bury: We could apply other, more effective methods, such as those used at football grounds. Each bottle seized by security men at the workplace should be immediately poured down the drain, not kept in safe custody to be returned to the owner as he leaves the premises after work. Each employee caught attempting to smuggle a number of bottles of alcohol onto the premises should be handed over to the Citizens Militia, because experience has shown that such offenders usually have...dozens more bottles stashed away at home. They are simply speculators.

Scholl: And what should enterprise managers do?

Bury: First of all they should introduce a rigorous system of monitoring the observance of the sobriety-in-the-workplace rule. They should set up procedures for recording all instances which this rule is violated. They should also set up an extensive program of information and education, for the present practice is usually limited to the mere formality of instructing new employees that they are under an obligation to remain sober on workplace premises. The guidelines issued by our ministry also mention the legal measures, penalties, and other sanctions that should be applied against all those who break the stay-sober rule.

Scholl: You spoke of a system of monitoring the observance of this rule. Would it be an exclusively administrative system?

Bury: Thirty-seven percent of enterprises included in our survey have public monitoring cells working side by side with administrative controlling bodies, and made up of representatives of the trade unions, party and youth organizations, the Polish Red Cross, the Volunteer Reserve of Citizens Militia, and other bodies. The involvement of the "public element" ought to be much greater, since any pressure or sign of condemnation from one's colleagues is far more effective than administrative measures.

Scholl: What about the influence of the industrial health service?

Bury: According to our information, only 78 percent of industrial health service centers cooperate with enterprise managers im promoting health education among employees and include instruction about the awesome consequences of alcohol abuse in their educational programs. The rest of them do not tackle this issue at all, nor do they declare any intention of doing so. In any case, even the so-called "active" industrial health centers do not go beyond...displaying antialcohol posters. Talks, lectures, and programs broadcast on enterprise inhouse radio systems are very rare, as are individual face-to-face talks.

Scholl: Which professional groups and milieus are particularly vulnerable to "drunken mores"?

Bury: All those which suffer from the manpower shortage. They often recruit people who have been dismissed from other places on disciplinary grounds, chronically work-shy individuals, or persons discharged from penal institutions. Many of these continue to drink and are soon dismissed again on disciplinary grounds, whereupon the enterprise--which is often a municipal works or a construction firm--will shortly seek to replace them by others, who frequently have the same sort of background. Other enterprises likely to be affected are as a rule those where people sit about with arms folded waiting for something to do and "whiling the time away," that is, drinking.

Alcoholism is boosted by doing "field work" away from one's workplace, where constant supervision is not feasible, and control difficult.

Scholl: And, of course, by undue leniency on the part of management.

Bury: Quite. Materials collected by the Supreme Chamber of Control indicate, for example, that the management of the Stilon Manmade Fiber Plant in Gorzow failed to apply administrative sanctions against 16 employees who had violated the sobriety-in-the-workplace rule. There was a similar case at the Mostostal Steel Structures Manufacturing Plant in Radomsko. Also in Radomsko, at the Komuna Paryska Industrial Plant 20 employees, including 4 on the enterprise security staff, were not disciplined for breaking that rule. Moreover, two of the offenders were not only not penalized for being drunk, but were subsequently twice promoted from their previous grades. Investigation carried out at the Hutman Nonferrous Metals Foundary and Manufacturing Plant in Wroclaw and the Sacz Ore Processing Plant revealed that employees who had been disciplined for drinking alcohol at work were nevertheless given monetary awards and increased pay bonuses.

Scholl: Are parent agencies not too lenient themselves twoard those lenient managers? Have you ever heard of a manager who was publicly fired because he was excessively lenient?

Bury: I must admit I have not. But the premier in the past has recalled voivodas from their posts. I believe that the amended labor code should include a provision that would require managers to summarily dismiss employees for drunkenness at work. And every parent agency should have the following condition added to the principles of its bonus-awarding policy: A manager will be entitled to a bonus only if he has been successful in discouraging the practice of drinking at work in his enterprise. Let us not add a fourth "S"--that of self-will--to the three "S" principle of the reform /self-reliance, self-management, self-financing/. Especially when it might lead to an aggravation of our social ills--ills that are becoming a plague.

Scholl: Thank you for the interview.

GOVERNMENT PRESIDIUM ON YOUTH, LAND, GOODS

AU262026 Warsaw TRYBUNA LUDU in Polish 21 Jan 86 p 2

/Excerpts/ PAP--At its 20 January session the Government Presidium studied a report for on the implementation to date of the 1982 government program for improving the conditions for young people's lives and careers. Chairmen of the socialist youth unions such as the SZMP, the ZMW, the ZHP /The Polish Scout Union/, and the SZP /the Polish Student Union/ were present.

The government youth program contains almost 200 tasks for various government offices, state institutions, and organizations. During the first stage of this program's implementation many ad hoc tasks were accomplished in order to counter negative phenomena as they were produced by the socioeconomic crisis. The youth program also contains long-term tasks up to 1990. These programmatic and institutional tasks will create legal and organizational mechanisms to promote the development of young people and to ensure their participation in solving our country's important problems.

The session agreed that the main lines of the youth program are still valid, but that sociopolitical and economic conditions have greatly changed since 1982. That is why the presidium recommended that the program be modified and that the socioeconomic development in 1986-90 should be taken into consideration. The minister for youth affairs was instructed to draw up a report on the conditions for young people's lives and careers.

The Government Presidium studied the implementation of the land reclamation program and the tasks for 1986-90.

Despite considerable progress in organizational, legal, and economic undertakings, the land reclamation operations planned for 400,000 hectares of farmlands in 1983-85 have not been fully accomplished. The regulation of rivers and the construction of antiflood embankments are some of the urgent tasks. The reclamation of 700,000 hectares of farmlands in 1986-90 will require guaranteed investment funds and better equipment for land reclamation enterprises.

The Government Presidium evaluated the flow of goods to the markets in December 1985 and this month. In line with the plan, the per capita flow of foodstuffs last December was higher than in December 1984. The flow of foodstuffs and industrial goods in the last quarter of 1985 markedly increased.

This month the flow of foodstuffs will have increased in comparison with January 1985. There will be more meat, butter, margarine, and pork fats. The flow of dairy and cereal products continues to meet needs.

The flow of industrial goods was not flawless and showed greater ups and downs, despite the correct implementation of the market supplies stipulated by the 1985 annual plan. There were shortages of building materials and difficulties were encountered in supplying coal users, especially rural users, although decisions were made to increase the supply of coal, particularly coal in large lumps.

AIR FORCE CAMPAIGN FOR 10TH PARTY CONGRESS

AU241424 Warsaw ZOLNIERZ WOLNOSCI in Polish 21 Jan 86 pp 1, 6

/Report signed "(WIER.)": "Before the 10th PZPR Congress--Initiatives For Progress"/

/Excerpts/ Preparations for the campaign preceding the 10th Party Congress are taking place in the air force as well as in other armed services and military districts.

The attention of all party cells and organizations in the air force continues to be focused on training the aktivs who will accomplish the main tasks in the first and second stages of the campaign.

The Poznan plenary session of the PZPR Committee in the air force was a new important phase in precongress preparations. The session, which was attended by members of the air force party control commission, discussed the ideopolitical and organizational aspects of the precongress campaign and the tasks for party cells and organizations on the basis of the 23d Central Committee plenum.

The participants in the discussion stressed that winning an increasingly more universal and more specific public support for the PZPR is a general party task and aspiration and that one welcome result of this should be the development of party ranks.

Discussing other questions stemming from the precongress campaign, the participants in the discussion stressed the great importance of individual talk in all primary party organizations to help to crucially enrich the all-party and nationwide discussions, which constitute a great ideological training that adds to the knowledge of the goals and principles of our system and the 10th congres theses. These meetings will choose delegates to higher party conferences through the air force precongress conference.

MESSNER AT ACADEMY PARTY MEETING

AU271331 Warsaw ZOLNIERZ WOLNOSCI in Polish 23 Jan 86 pp 1, 2

/Text/ PAP--The PZPR Committee of the Katowice Economic Academy inaugurated the 10th Party Congress campaign at its 22 January open meeting devoted to the determining factors of the country's socioeconomic development. The committee numbers 189 party members and candidates.

The academy's scientific workers who are party members are active in the advisory bodies of the voivodship party and administrative organizations. The meeting was attended by about 400 scientific workers, academic instructors, and students as well as by Premier Zbigniew Messner, who is a member of the academy's party organization.

Discussing the main determining factors of the country's socioeconomic development in 1986-90, Z. Messner stressed that the government's plan for these years will be discussed during the precongress campaign.

The 10th Party Congress, which is the supreme forum of the party, will adopt the draft plan and will submit it to the Sejm. Z. Messner discussed the state of our economy and said that, compared with its condition in January 1982, it is good.

For the past 40 years, he continued, Poland has always been open to other countries and our people have been able to compare the living standards in them.

People always find it easier to note the positive aspects of other countries' conditions, ignoring their negative aspects, and that is why people generally think that others have it better and that is why their aspirations outstrip the potential to fulfill them under conditions of crisis and restrictions.

Z. Messner included our debts and the psychology and awareness of our people among the basic determining factors in our development. The authorities must fully realize these and other barriers before they can launch the activities aimed at overcoming and reducing the results of these barriers and before they can optimally devise tasks for the coming 5-year period.

Z. Messner also answered questions from the floor and explained various issues such as wage policy, systems of incentives, and efforts to reduce the material intensiveness of our economy. The meeting stressed the need for efforts to more accurately accumulate and use the people's energy and creative talents with a view to implementing the main economic goals.

VOIVODSHIP LAW AND ORDER PLENUM; BARYLA SPEAKS

AU311512 Warsaw TRYBUNA LUDU in Polish 29 Jan 86 p 2

/Text/ PAP--Key questions connected with strengthening observance of the law and socialist ethics were the subject of a voivodship PZPR committee plenum held in Chelm on 28 January. The meeting was attended by Jozef Baryla, PZPR Central Committee secretary.

Manifestations of social pathology, and other negative phenomena as well as ways of combatting them were discussed during the meeting. Much attention was devoted to the need to focus social activity on strengthening the ethical well-being of society. It was stressed that certain negative ethical phenomena call for the application of decisive countermeasures. Incorrect actions with respect to work and interpersonal relations were highlighted. A lack of respect for older people, unkindness toward others, and low standards in manners and hygiene were mentioned.

The causes of social pathology were pointed out at the plenum. It was established that the influence exercised on production discipline had been insufficient. A rift between laws and labor responsibilities had emerged as a result--wages are rising more quickly than output, there is often a lack of respect vis-a-vis work. The number of unworked hours is too high, as is the number of cases of false claims for social benefits. The continuing danger posed by crimes in which alcohol abuse is an underlying factor was discussed at the plenum alongside economic crimes; a lack of respect for social property; and offenses committed in the conduct of administrative work. Frequent instances of idleness, cliquishness, arrogance, reaping benefits at the expense of other are phenomena that undermine social justice and must be condemned and eliminated in a consistent fashion.

J. Baryla said, inter alia, that it was the job of the party to initiate and coordinate the struggle for society's moral wellbeing and to strengthen socialist ethics. This means countering all that harms society, hurts it, and is damaging to the common good at all times. There is strong public justification for making action in this area a priority, as evidenced by many of the views expressed during the campaign which preceded the Sejm elections. The interests of the party and the state are fully in accord with public expectations in this area. Law observance, stressed J. Baryla, is more than good laws, it is also a social reality created by the actions of actual people, it is the observance of regulations by all citizens, as well by offices and institutions.

The plenum passed a resolution defining tasks for the voivodship party organization in the field which had been the subject of the discussion.

ARMY CONFERENCE EXAMINES POLITICAL INSTRUCTION

AU031335 Warsaw ZOLNIERZ WOLNOSCI in Polish 30 Jan 86 pp 1, 5

/"Own correspondent" report on regional armed forces' conference held at the 1st Praga Mechanized Regiment on 29 January/

/Excerpt/ A regional conference of organizers and heads of political instruction groups devoted to finding improved and more uptodate ways of conducting ideological and political education in soldiers' collectives was held at the headquarters of the 1st Praga Mechanized Regiment on 29 January. The conference was attended by Division General Tadeusz Szacilo, chief of the main Political Administration of the Polish Armed Forces. Taking party in the conference were officers representing units of the Warsaw Military District, the air force, and the National Air Defense Forces. The conference was chaired by General of Brigades Leslaw Wojtasik, deputy chief of the Main Political Administration of the Polish Armed Forces and chief of the Propaganda and Agitation Department.

The meeting provided an opportunity for those directly involved in conducting political instruction programs at the unit and subunit levels to exchange experiences of the methods currently employed in this area of army education. It also provided an opportunity to voice views on problems currently encountered in instilling in soldiers a socialist awareness. The meeting also afforded an opportunity to work out short-term and long-term activiites in this field.

Introducing the discussion, the chief of the Main Political Administration Propaganda and Agitation Department noted the special and important place occupied by political instruction--which harmoniously unites Marxist-Leninist theory with practice deriving from the current sociopolitical situation in the country--in efforts to continually improve the combat readiness of our armed forces.

Life in the army and the nature of instruction in everyday practice have clearly shown that the execution of ideological and political tasks in units of the Polish Army has been conducted well and consistently. The execution of these tasks has produced undeniable results in the form of a systematic increase in soldiers' political awareness and in their active involvement in discharing their military and civic responsibilities.

However, organizers and heads of political instruction groups in individual military communities also realize that it is not enough to keep on using the same methods of operation in an area of such importance for the socialist education of the younger generation. Life continues to make it imperative to search for continually better ways of conducting ideological work; to eliminate flaws and shortcomings; and to update instruction methods.

Precisely these realities gave the discussion an imaginative and constructive character. It is obvious that in our difficult economic situation it is impossible to close all the gaps that exist. Economic solutions must, therefore, be sought but these solutions should not entail abandoning modern methods and modern technology.

While welcoming the intdouction of new teaching aids, certain speakers, among them Maj Tadeusz Jarosz and Capt Jerzy Pytasz, noted that even the most uptodate technology is no substitute for people in the area of ideological training, people who are committed, well trained, and who identify themselves with the views which they express. They suggested, therefore, that heads of instruction groups continue to be assisted. Most heads of these groups are young cadres who are eager to work but in need of assistance and goodwill. Training programs that are well prepared and carried out well, courses in instruction and the methodology of teaching, enhanced by the inclusion of practical demonstrations and corrections to the program, should definitely make matters significantly better.

Capts Kazimierz Seliga, Stanislaw Furman, and Jacek Juszczuk raised a particularly pertinent issue in the view of those attending the meeting. They draw attention to the low level of participation, at least during the first stages of instruction programs, on the part of those attending classes. The basic cause of this is the great range of backgrounds from which participants come. To influence their awareness effectively one must get to know them, their interests, and their level of knowledge. It is the responsibility of the head of the political instruction group to do so.

Addressing participants in the conference, Division General Tadeusz Szacilo, chief of the Main Political Administration of the Polish Armed Forces, expressed his respect for the complete dedication and the ability to unite military duties with didactic and instruction duties displayed by the organizers and heads of political instruction groups in the armed forces.

Your motto, said the general, is to teach and to educate, to create the intellectual foundation of soldiers' attitudes. This does not mean conveying knowledge in the narrow sense but creating the underlying ideological and ethical basis which shapes the manner in which soldiers understand and view their military and civic responsibilities.

The chief of the Main Political Administration also pointed out the role of subunit commanders and heads of political instruction groups in strengthening discipline and eliminating the many negative phenomena which exist in army life. This role is of no small importance for the further improvement of combat readiness, and for shaping the socialist awareness of soldiers who, in the year of the 10th PZPR Congress, will realize ambitious military and civic tasks. The general also described the main ideological and political tasks in the precongress campaign.

PUBLISHER ON PRINTING WOES, CENSORSHIP, OPPOSITION AUTHORS

Poznan WPROST in Polish 3 Nov 85 pp 4-6

[Interview with Stanislaw Bebek, president of the publishing cooperative "Czytelnik", president of the Polish Association of Book Publishers, by Janusz Michalak: "Intellects Must Also Be Furnished"]

[Text] It is well known that the situation of the Polish book and the publishing movement is not good at present. It strikes at publishers, authors, and at readers in general while they are trying to find good, valuable books in various fields but leave the book counters with empty hands. Is there a chance for emerging from this difficult situation? What do the publishers think about it? This conversation with Stanislaw Bebek, president of the Polish Association of Book Publishers, begins a cycle of articles on this subject.

[Question] Mr. President, I have come to you for a prescription on what must be done to cure the present situation in the Polish publishing movement?

[Answer] You are an idealist if you believe in a miraculous prescription. However, what must be done is known to all of us in this establishment, from the common printer to the ministers and members of the planning commission. Before your arrival I had a telephone conversation with one of the economic vice-presidents who was asking me for a certain book which he can't find anywhere. Do you think he isn't aware of the situation?

[Question] If everyone knows what the situation is and what must be done, then why..?

[Answer] Today, in Poland, it is not possible to cure one area, "one piece of life", and bring it to perfection if all that is connected with it is not functioning properly. We publishers are in just such a situation.

But there is no crisis in the publishing movement, the crisis is in printing. The publishers could blanket the country with valuable texts which the people would buy, but they have no place and no equipment on which to print.

In the 1970's when we spent billions in various fields, we spent hardly anything on the printing industry. In that situation a real "lucky event" was the fire at the "Dom Slowa Polskiego" printing establishment several years ago. Thanks to it it was possible to expand the printing base somewhat, but, more importantly, to improve the work safety conditions for the workers.

The major part of equipment in printing houses is falling apart; 60 percent of the printing presses are over 55 years old. In spite of sporadic remedies to some shortcomings the production capacity has not expanded because it has reached its limits. The publishing movement in Poland is stuck as well.

[Question] Three years ago, though, there was a large jump in publishing?

[Answer] But why? Because we utilized the time when periodicals were not being produced during martial law. We used those presses and paper, and now we are trying to prevent ourselves from being kicked off. But our perspectives are bad. As you can see for yourself, the kiosks are presently full of periodicals.

[Question] How many titles does your publishing office put out in a year?

[Answer] We planned in good faith, hoping for development, as was predicted, and we wanted to publish, for example - this year, about 300 titles. Then we corrected the plan to 210 titles, but really only 170 will appear if things go well. But we have contracts going all the way into 1990. I do not know if I am emphatic enough, but this fact presents a real drama for authors and publishers.

[Question] If the situation is so difficult then how do you explain the fact that bookstore racks are full of books? But most often "that one" cannot be found?

[Answer] I protest against putting the situation in this way. There are no unnecessary books. The general opinion, that bookstores are filled with trash is false. After all, each book has an author and a publisher. One should talk in concrete terms, not annonymously. In Polish journalism this manner has spread, only Jan Marx of KULTURA, abstracting from his reviews of specific books, has come up with an honest method and "socks" it to actual authors and publishers.

[Question] If we assumed that there were no unnecessary books, then you will no doubt agree that in the present situation of enormous shortages there are books whish are more or less necessary than others. Even the director of PIW [Polish Publishing Institute], Andrzej Wasilewski, has given examples in the media, of large press runs of books which, should we say, are less than necessary?

[Answer] So what are you proposing? Mr. Wasilewski proposed 200 titles which should be printed in large numbers and which would give Poles a cultural grounding. To me this means cultural suicide. How can you tell someone to read those 200 books and no others? What do you mean by a large press run? This would mean taking other books off the presses.

Of course there is a shortage of the classics, so we print them. I have printed a million copies of "Pan Tadeusz," but not many people are aware that I had to stop the printing of 30 books by modern Polish authors to do it.

[Question] But the daily press reported that this was done through the utilization of "surplus" paper and press time.

[Answer] Some surplus! It was the same paper and the same presses.

[Question] But even PIW publishes books in large press runs.

[Answer] Yes, when they are low on funds they print Sienkiewicz. But should our thoughts run only to the classics? After all, today people are writing books and want them published. The first timers must try, must even have the right to make mistakes; if the first book does not turn out then perhaps the third one will. There is no other way of raising writers but by publishing them.

[Question] I agree, we must publish both the first-timers and the classics. We must publish Polish literature and some of the more interesting foreign works. The problem, no doubt, lies in the proportions.

[Answer] Presently, the publisher cannot set the proportions. From this year's plan I know that we will not publish about 50 of the proposed titles. But I have no way of knowing which titles will come out and which will not. It is fate that intervenes in deciding the "proportions."

[Question] How do you establish the publishing policy?

[Answer] We manage to cope. All I can say is that all books published by "Czytelnik" are sold and get decent reviews. Our inventory is zero, while we produce one billion zlotys worth of books. Our supply is worth 60 million zlotys which is exactly the amount which, for example, is sent from the printing house in Olsztyn to the warehouse from which they are distributed to bookstores.

The problem lies in the controls and analysis of factors which are continually "governing" the proper functioning of the publishing houses and which create dense memoranda on the subject. We are continually being asked what titles and which authors we are going to publish in a given year. What is the importance of such information? After all the subject of the book is known only to us, and as for the author it can only be said whether he is politically "proven" or not.

One would like to say, "Leave the publishers in peace." Since the publishers are already in their positions then they should have the right to make decisions, and they will manage for themselves. One should trust the publishers.

[Question] Especially since, according to the reform, publishers are now independent?

[Answer] The only one who can be independent is the one who has the funds, and, in our case, the technical means to publish books. But really, at present we are independent from intervention by officials who at one time were able to direct us.

[Question] You are independent, but according to the reform, you are also set up for obtaining maximum financial gain.

[Answer] If at "Czytelnik" we make, for example, 100 million zlotys in profit, then 69 million zlotys are taken up in taxes. We are not set up for profit, but I must admit that we need money. Even if it is used to pay the printing houses on time, a factor which determines when a book will be put on the presses.

One cannot ignore the fact that the introduction of economic rules into the publishing movement has created, in my opinion, a harmful effect, which is the printing of books used to stupefy society. I am refering to books about divining, bio-electricity, the laying on of hands, and the like. This is a phenomenon about which not much is said but it is very harmful to society.

[Question] Mr. President, economic rules govern publishing and the book market now is very absorbent. In this situation it must be easy for publishing establishments to make money. The publishers then must be in a comfortable situation which causes many to follow the path of least resistance.

[Answer] I do not understand.

[Question] There is an opinion that many publishers do not wish to take risks by publishing young "untried" writers or the so-called controversial ones. An insured posture seems to be most profitable.

[Answer] In a certain sense it may be said that it was always like this. I'd like to add that it is less so now than before because "mistakes" now carry no special penalty.

Carrying excessive insurance is unnecessary today, but it still happens. But this concerns specific individuals in the community and we know them. We know those who do not want insurance as "a principle" and publish difficult books; for example Andrzej Kurz from the Literary Publishers in Krakow. For years he has maintained that he will publish good books - not specific authors. This is because literature is not hagiography for certain persons.

This view is held by the highest officials. There is a principle in effect that even if someone considers himself a member of the opposition but writes books that are deemed beneficial from our point of view, then we will publish them. Our office, for example, in accordance with this principle, has published Andrzejewski for years, and still publishes him in spite of certain "suggestions." For example, we publish Tadeusz Konwicki and other young writers who have certain and not other views on political subjects, things they know nothing about, but who write promising books... Now, in the case of publishers who only look for insusrance I have a proposition for you journalists and critics; gentlemen, take them to task and work them over in the press so that they would know that in their profession there should never be an insured position. If such a publisher rejects a good book without a good reason then he should reap the consequences.

This, however, is a specific problem that concerns specific people in specific publishing houses. It has nothing to do with the government. From that direction, I assure you, we have never had so much creative freedom. Not one of our current books has been held back by the censors.

[Question] Did this happen often in the past?

[Answer] With the last team four were held back. But I did not break up the set. I made chalk proofs, and when I was finally allowed, then in the period of two weeks I published them. We at "Czytelnik", also, for example, published "Salve for Rats" by Madej, a book that was previously published by the Literary Institute in Paris.

[Question] Some say that it is easier for writer who is connected with the opposition, or to say more delicately, one who feels some unease toward the government, to publish a book than for a member of the new Literary Union or for a so-called loyal author.

[Answer] The criteria of loyalty or opposition should have no significance. The actual book must be the deciding factor. If it is valuable and contributes to the treasury of human thought then it deserves to be published. If it is merely a declaration of loyalty, then it does not.

[Question] Let us move on to a different problem. For the Polish reader it is not only important that Polish books are published, but that they not lose contact with interesting developments in world literature. What are the prospects since we all know the difficulties with hard currency...

[Answer] There are no special difficulties with hard currency. Our publishing house, for example, for 3 years has not spent a single dollar on these books. Why? Because we have developed relations with authors and publishers in the West. We maintain contact and tell them that presently we can only pay them in zlotys. When we have dollars then we will pay in that exchange, but as long as we don't have them then...

[Question] And they accept these arguments?

[Answer] Perhaps unwillingly, but for the most part they accept them. This is why, even during the most difficult period during martial law, a time of tight restrictions, we did not drop these contacts. Of course there are those publishers who would rather write a request for hard currency rather than go to a little trouble, but I believe that in the present situation that would be harmfull to the economy, a phenomenon that should be treated like all the other examples of waste.

[Question] Strongly said! What can those publishers who have no contacts do? Perhaps an answer could be found in printing certain books for foreign distribution. In such a case could not the publishing houses establish their own pool of hard currency?

[Answer] Even those who publish for foreign distribution do not have such a pool since the regulations do not permit it.

[Question] I have heard that having Polish books printed outside the country, encyclopedias for example, costs three times as much as buying new modern equipment outside the country for producing these books in Poland.

[Answer] This is true, but first one must have the funds for such a purchase. For example, we paid for the printing of encyclopedias in Finland through exta deliveries of cement. We send waste paper and rags to Yugoslavia, etc. These activities are very effective and indicate that everyone here has not lost his head in a difficult situation.

[Question] You then believe that in spite of the shortages of hard currency we are not in danger of loosing our contact with modern world literature?

[Answer] Of course we won't. Any publisher who makes the effort to obtain foreign contacts makes them and can publish the books. The danger is from another direction.

Shortages of various resources are forcing us to cut back our publishing plans; the proportion between domestic and foreign literature is in danger. Of course this is always at the cost of foreign literature, for when it comes to choosing the publisher must always give preference to Polish literature.

[Question] But are there presently many truly valuable examples in modern Polish literature?

[Answer] Unfortunately, there are no great works. In my opinion, modern Polish literature is going through a deep crisis. After great historical events we only have third class literature on the subject. Perhaps it is too early and my expectations are too high; but it is a fact that there are no truly meaningful books on these subjects in the official or the so-called second circulation. I must admit that this is our chief worry.

[Question] Mr. President, "Czytelnik" and other large publishing houses operate in Warsaw. There is a colony of publishers here, as you have mentioned in previous interviews, which is but a few steps from all centers including the government. Is this situation a help or a hindrance?

[Answer] It varies. From one point we are constantly susceptible to constant "suggestions" and telephone calls which distract us from our work. On the other hand, here is a concentration of writers, translators, and critics which enables us to make decisions quickly and come out with initiatives.

[Question] Do you support the postulate spread by our press that in our present situation a certain redistribution of resources is unavoidable; that after assuring the necessary allocations to keep small establishments going and developing, most of the resources should be concentrated in the leading publishing offices which make the greatest contribution toward supplying the book market and assure the best conditions for satisfying the reader's needs?

[Answer] I do not support this postulate. I cannot stand centralization. It is a fact of life in Warsaw but I won't change it since I am not willing to move the Dom Slowa Polskiego. But the small publishers must not be destroyed because we need them all. Conversly, we must build up the smaller publishing centers and decentralize the publishing movement.

For the present situation there can be only one postulate - we must fight bureaucratic thinking at the highest levels and modernize the printing houses. This is because if one day the economy begins to move, then that will be the end of the Polish publishing movement. Then, for the ordinary advertisement of products we will need all kinds of beer labels, operating instructions and pamphlets with which books cannot compete.

[Question] The printing houses prefer this type of work over labor intensive books?

[Answer] This is not a question of "preference," the situation is forced upon them.

If we assume that after 5 years there are to be 1.5 million more citizens in Poland, then let us consider the fact that we will need more schoolbooks; then indeed the future looks black. If the economy moves, and I sincerely hope that it will, then the increased need for instruction books will crush literature. This will be a real tragedy.

[Question] As far as I know, you have conferred on this matter with the highest officials.

[Answer] And not much has come out of these meetings. Everyone is kind; they say that they understand the situation, but still no decision has been made on this matter. In this way we may be petted to death. But some decisions have been made earlier. New printing plants were to be built in Poznan and Torun, but nothing practical has come from that decision.

[Question] Perhaps we have been lulled by the success achieved after the prime minister's appeal, when production of books increased rapidly from 3.7 copies per person in 1981 to 6 copies per person.

[Answer] I explained earlier that this was only possible in a situation when printing presses were standing idle. But no one seems to pay attention to the fact that the number of titles has decreased. In practice this means that entire fields of endeavor have been removed from publication. Just look at what has happened to scientific publishing. Publications from scientific congresses appear years after the event. The scientific book, in many cases, has become historic literature. Out scientists cannot exchange works with their colleagues in other nations. Time is especially deadly to those books.

[Question] Some journalists believe that the lack of decision on the matter of developing the printing industry is the result of the fact that publishers are not a strong enough lobby and do not exert sufficient pressure on the specific government units.

[Answer] We do not need a lobby but a little imagination about what will happen when the economy starts to move. There must be a balance struck between the present poverty and thought for the future. Presently we have reached the limits of printing capacity and it can only get worse. Most necessary in this situation is even a gradual modernization of the printing houses, and the building of new ones in Poznan and Touun.

We must keep reminding the public that it is a duty of a people who represent the socialistic system to care not just for the furnishing of apartments but also for "furnishing the intellect." Meanwhile, the burgeois life style which has become established during the 1970's seems to hold sway. We care more about satisfying our passing whims than about the intellectual culture of our nation and in this the book is most important.

[Interviewer] Thank you for the interview.

DAILIES FOCUS ON CPSU PROGRAM CHANGES

Correspondent Praises Party Primary

Warsaw TRYBUNA LUDU in Polish 14 Nov 85 p 6

[Article by Jerzy Kraszewski, Moscow correspondent: "The Class Vanguard"]

[Text] The nature of the proposed changes and additions to the CPSU statute corresponds to the nature of the new wording of the party's program. Both documents have the same genesis: they stem from the important and vast theoretical work performed recently by the CPSU. They arose out of the past experience in building socialism and a penetrating, realistic, Marxist-Leninist analysis of the Soviet society's state of development. A theoretical thesis was drawn from this analysis as to the growth of the leadership role of the party--which is the nucleus of the socialist political system--and a new approach to all aspects of party work was proposed. While remaining the party of the working class--its vanguard--the CPSU also became the party of all of the people.

Discipline and Democracy

The basic meaning of the proposed changes in the statute depends on the preservation of dialectic unity between greater intraparty democracy, activeness and initiative, and a growth in responsibility, with all that this entails. On one hand, the standards of intraparty activity require that democratic principles be observed, and on the other hand, that party discipline be observed, that the minority yield to the decisions of the majority. Both parts of this formula--democracy and discipline--which pertain to party members equally as much as they pertain to party organizations and echelons as communist groups, must be examined and applied jointly. Only then will their political and organizational effectiveness be ensured.

In this context also we must examine the plan for an expanded concept of the party members' problems, duties and rights. In the new version of the statute, communists' duties are outlined more fully and in greater detail than in the document now in effect. They include adherence to the party's general line, constant improvement of Marxist-Leninist knowledge, exemplary behavior on the job and in one's personal life, observance of standards of communist morality, and critical evaluation of one's own work and attitude.

In fact, the entire chapter "Party Members, Their Duties and Rights," reads entirely differently in the new draft. It reads like a catalogue of traits which describe the communist stance and determine the party member's ideological, moral and political profile. But in no way is this simply a catalogue of postulates. The statute also draws up a system of actions which shape the desired attitudes and exact them.

Unquestionably, the list is headed by a set of provisions relating to membership. Criteria for acceptance are more stringent, recommendations are regulated, rules of work with candidates are defined, and the practice, already in effect, that members will be accepted into the CPSU only at open party meetings, is sanctioned.

It is emphasized that party membership does not bestow any privileges or conveniences, but only imposes heavier burdens on the communist, more duties and greater responsibilities for everything that is done. Demands on party members clearly increase.

I believe that these more stringent ideological, moral and political criteria, the pressure to maintain high communist standing, the sense of communist pride, deserve separate and more thorough consideration.

Leadership, Control

A similar, separate consideration is doubtless due the statutory increase in the Primary Party Organization's role in the party's activities, its responsibilities, expanded political, ideological and leadership functions, and its larger role in party meetings.

"The Primary Party Organization (PPO)," we read in the draft of the changed version of the statute, "is the political nucleus of the workers' collective. It conducts its work directly among the people, unites them around the party, organizes them to execute tasks in the building of communism, and takes an active part in conducting the party's cadre policy."

In practice, this means, for example, that the economic and state leaders and activists are under constant party control, that they are responsible for their work directly to their own party organizations. This means also that the PPO's are the inspirers and activators of initiatives which serve to intensify production, accelerate scientific and technical progress, modernization, growth of labor productivity, etc. At the same time, they conduct ideological and educational work among the workforces.

In the CPSU attention is often called to the fact that if the program concepts were to be restricted strictly to considering and mirroring the attitudes and moods already existing at a given time, and did not try to deliberately change them, we would be dealing, using Lenin's words, with an abandonment of spontaneity. However, it is the party's duty to change reality.

The party's control function in factories, ministries and other state and administrative institutions, is growing. The CPSU PPO's have had the right to control administrations for a long time already; the new version of the statute elevates this right to one of the most important tasks. It is regarded as one way by which the party can fulfill its leadership role.

In passing, let us take note of something else: In increasing the PPO's role in the conduct of cadre policy, the party is also requiring more from its management employees in the state and economic apparatus. The primary organizations and echelons have a duty to enforce their responsibility for the implementation of the party's resolutions and instructions.

Leninist Standards

That which is most important in the draft of the new wording of the CPSU statute: Raising the level of the party's political and organizational work, making evaluation criteria more stringent, ensuring the purity of party membership, and improving the performance of the leadership role, so that the party in all of its elements--from the Central Committee to the primary organization and group--is truly a deciding factor in the government.

That which is innovative in the proposed new version of the statute: Skillful coordination of the party's increasing leadership functions, a distinct growth in its guiding role, while creating conditions for the development of independence, initiative and activeness in state and social institutions and organizations. First, such an approach makes these institutions responsible to the party, and second, it cautions against their being duplicated or replaced by party echelons.

The detailed rules for exercising the leadership role in this area are outlined in a new chapter, "The Party and State and Social Organizations."

It may be said, therefore, that the requisite for a program which effectively perfects socialism, the requisite for improving the quality of social, political and economic relations, is comprehensive activation of the party. Activation which is understood to be full compliance of practice with the Leninist theoretical concept of a new-type party. A concept based on the principles of democratic centralism.

"The CPSU organizes its work on the basis of the inviolable observance of Leninist standards of party life, the principles of democratic centralism, collegiality of leadership, comprehensive development of intraparty democracy, creative activeness of communists, criticism and self-criticism, and openness,"--the new version of the CPSU states.

Socialist Life Model Provided

Warsaw TRYBUNA LUDU in Polish 19 Nov 85 p 7

[Comments by Jegor Ligaczow, CPSU Central Committee Politburo member and Central Committee secretary, on the draft of a new wording of the CPSU program]

[Text] (PAP) A partywide and nationwide discussion is going on in the Soviet Union on important documents dealing with theory and policy, including the draft of a new version of the CPSU program.

In raising these issues, Jegor Ligaczow, CPSU Central Committee Politburo member and secretary of the Central Committee, said in KOMMUNISTA that the draft approved at the October 1985 plenum of the CPSU Central Committee retains the basic provisions of the party's third program, now in effect, and therefore it is entirely correct to regard is as a new edition of the CPSU's current program. Despite the fact that for many reasons we have not been able to solve some social problems within the time set, our successes convincingly contradict the fictions of imperialist propaganda that the third program failed and that we were forced to abandon it, Ligaczow writes.

The author calls attention to the fact that implementation of the third program was begun at a time when the international situation was very complicated. At that time there was no military-strategic balance between the Warsaw Pact and NATO. During the past quarter century the arrangement of forces in the international arena has changed in favor of socialism. An approximate military-strategic balance between the USSR and the United States has been established. This is a historical achievement of real socialism, Ligaczow says, which makes it possible, as the new version of the CPSU program demonstrates, to defend and strengthen peace, to restrain the forces of aggression and militarism on behalf of the lives of present and future generations. Ligaczow then emphasizes that the Soviet party, better than ever before, now understands the inadmissibility of "leaping across historically indispensable levels of social progress, applying communist principles and formulas without considering the material and spiritual maturity of the people."

In comparison with the program now in effect, the new version contains many new and important provisions: On a planned and comprehensive improvement of socialism; on methods of moving to an intensification of the economy, improving the management system and ratios of division; on obliterating social-class differences, solving the nationality questions, and establishing a new historical community--a Soviet nation; and on socialist self-administration and the prospects that it will gradually transform itself into a communist self-administration.

The author next calls attention to the fact that in the formulation of the party's strategies dealing with the economy and the development of technical-materials facilities, in the draft of the new version a problems-approach predominates, and not a sector-approach, as heretofore. The goal is to achieve the highest labor productivity in the world and double the country's production potential by the end of the century.

The party's social policy is looked upon in the draft as a powerful means of accelerating the country's economic development, increasing the activeness of the people as an important factor in the political stability of society, shaping a new individual, and strengthening the socialist model of life--Ligaczow emphasizes.

Technological Development Discussed

Warsaw RZECZPOSPOLITA in Polish 23-24 Nov 85 p 7

[Text] PAP correspondent Slawomir Popowski writes: What can be done to hasten technical progress and improve its effectiveness in the economic area? How can we ensure rapid application of new engineering and construction solutions which guarantee a growth in labor productivity and thus better results? Those are the problems which are most often raised during the nationwide discussion now going on in the Soviet Union on the draft of the new version of the CPSU program and the main courses of development in the USSR to the year 2000.

In the many items published every day by the Soviet press there is talk not only about the goals but primarily about how they can be achieved, about what past experience might be helpful in the future and the obstacles which still exist.

Program Changes Viewed

Warsaw TRYBUNA LUDU in Polish 30 Nov-1 Dec 85 pp 1, 7

[Report on scientific conference organized by the PZPR Social Sciences Academy and the Executive Committee of the Polish-Soviet Friendship Society]

[Text] The draft of the new wording of the third CPSU program was the main topic at the scientific conference organized by the PZPR Academy of Social Sciences and the Executive Committee of the Polish-Soviet Friendship Society (PSFS), in which Polish and Soviet scientists and a large group of PSFS activists took part. The conference was conducted by Prof Wieslaw Iskra, deputy rector of the Academy of Social Sciences. The following papers were delivered: By Prof Anatolij Amwrosow, "Perfecting Socialism by a Historical Stage on the Road to Communism"; by Prof Prokofij Andrejew, "Strengthening the Leadership Role of the CPSU in the Life of Soviet Society,"; by Prof Valentin Kuzniecow, "Prerequisites for the Soviet Economy to Move into Intensive Development,"; and by Prof Tadeusz Jaroszewski, "The International Importance of Experience in Socialist Building in the USSR."

Professor Amwrosow said that the draft of the new CPSU program is a document which continues and expands CPSU strategy, draws general conclusions from a wealth of experience and takes into account proposals stemming from the changed internal and international situation, based on Marxist-Leninist theory. The scientific bases and the realism of the party's political line and its organizing role are the basic premises for the mobilization of party members and all of society for the accomplishment of primary tasks.

The points contained in the draft of the new version of the CPSU program have been treated in detail in that portion of the draft dealing with the main courses of the country's social and economic development. In it the party's assumptions are translated into the specific language of planned tasks and figures for the next 5 years and for the period to 2000. Prof Valentin Ruzniecow spoke very interestingly about this, saying that over the next 15 years an economic potential will be built which will be equal to that built over the past 68 years. This goal can be reached by rapidly applying scientific and technical advancements, quickly expanding the machines industry, changing the mechanism for establishing prices, giving priority to production of modern products meeting world standards, and improving production relations.

The draft of the new edition of the CPSU program, which generalizes the rich, practical and theoretical achievements of the CPSU, the entire contemporary experience in building socialism and communism, has important international significance. Prof Tadeusz Jaroszewski spoke of this at length. Stanislaw Wronski, chairman of the Executive Board of the PSFS, also referred to these problems in his speech, saying that a stronger USSR economic and defense potential is closely linked with the security of Poland and its economic development. Often the past governs the present, and thought should be given to what should be done for it to govern the future. The new version of the CPSU program and the discussion which developed after it was published, shows how this can be done.

The following persons attended: Henryk Bednarski, PZPR Central Committee secretary; Wlodzimierz Natorf, head of the PZPR Central Committee foreign department; and Aleksandr Aksjonow, USSR ambassador to the Polish People's Republic. Others who participated include representatives of the PZPR Central Committee Ideology Department and of the Main Political Administration of the Polish Armed Forces, and representatives of the Soviet Army in the Warsaw Pact and the Northern Group of Soviet Armies.

YOUTH, EDUCATION ISSUES HIGHLIGHTED

Enrollment Figures, Majors Described

Warsaw RZECZPOSPOLITA in Polish 15 Nov 85 p 5

[Article by Tadeusz Belerski]

[Text] An analysis of this year's higher school enrollment has been completed. We note that 50,990 people were accepted for the first year of day courses at all types of schools. Most people began instruction in the universities, higher technical schools and agricultural academies.

Czeslaw Krolikowski, vice minister of higher education and schooling, told a PAP journalist that a modified system of candidate selection was in effect for enrollment in daily courses for the 1985/86 academic year. Preferential points due to social origin were retained in only 11 majors. There remains in effect the rule whereby further qualifying procedures after passing the entrance examination were not applied to candidates who received the highest average grades on the entrance examination, candidates who have completed basic military service and those who completed a two-year period of employment in worker positions as well as orphans and those brought up in orphanages.

As in previous years, winners of student olympics and subject competitions and those who passed the entrance examination a year early and received credit for the student work corps were accepted without an entrance examination.

All told, over 110,000 candidates competed for admission to the first year of studies. The majority of the applications were noted in the universities, higher technical schools, medical academies and higher schools of education. There were 3.4 candidates for each place at Warsaw University and three candidates for each place in Poznan. Almost three candidates for each place applied to the Higher School of Education in Slupsk.

Major differences were noted in particular courses of study. Spanish was most crowded, with 8.6 people for each place, 6.9 for art history, 5.7 in psychology. In economics schools, economics and the system of foreign trade were popular. In the technical schools it was data processing and in the agricultural academies it was horticulture. Traditionally the fewest candidates applied to register for physics and chemistry.

According to our estimate, the number of worker and rural youth interested in beginning studies at higher schools of education, economics and agricultural academies and higher naval schools rose slightly. More young people from worker families were interested in beginning medical studies.

The candidates' level of preparation was analogous to previous years--varied but overall similar. A still disturbing phenomenon observed on the examinations was the applicants' lack of skill in logical and precise thinking and poor competence in the proper expression of their ideas.

The Ministry of Higher Education and Schooling, together with the department of education and upbringing, continued the system of preparatory courses conducted free of charge for candidates from worker and rural families, from families with extremely difficult environmental circumstances, orphans, half-orphans and those reared in orphanages. The candidates were evaluated by the high schools with the approval of the superintendents of education and upbringing. This generally proceeded properly, but there were recommendations that were mistaken or submitted too late. More than 16,800 people were recommended for participation in the June preparatory courses. Unfortunately, only 13,000 reported to participate in the courses. Among the participants, more than 60 percent were young people of worker origin. A major portion of the young people attended classes irregularly. Perhaps the reason for this is the fact that the courses and the young people have free room and board.

As in past years, classes were conducted in all examination subjects in the form of lectures, seminars and exercises. The participants' daily load amounted to from six to seven hours. Some 57.5 percent of the candidates participating in the courses received favorable results on the entrance examination. Of the young people of worker and rural origin, 56 percent passed the entrance examination.

Our department wishes to continue this form of preparation for the examination.

National Young Marxists Forum

Warsaw TRYBUNA LUDU in Polish 16-17 Nov 85 p 2

[Text] The large hall of the Academy of Social Sciences [ANS] was so full that there was a shortage of chairs. On the wall was the caption, National Forum of Young Marxists--"Marxism and the Present." They came to Warsaw on 15 November from throughout Poland, from all schools, at the invitation of ANS's young scientific employees.

Dr Marek Kuczynski (also young), the academy's education secretary, and Dr Mariusz Edgaro, chairman of the young scientific employees, performed the honors of the house. Professor and deputy rector Wieslaw Iskra welcomed those attending in the school's name, recalling his own youthful road to Marxism, wishing the program complete success and declaring support for it on the academy's part. Two discussions were anticipated, on the speech by Dr Miroslaw Karwat, "What it Means to be a Marxist in the 1980s" and by Prof Jaroslaw Ladosz, "What and How to Study as a Marxist."

The thematic scope of the discussions exceeded its intended limits. Discussed were conditions in the social sciences, the future of young scientific personnel, methodological issues, the place of Marxism in the modern world, scientific and para-scientific theories, the state of youth awareness and relationships between theory and practice--a great deal for a meeting of a few hours.

For the first time in several years, however, the voice of the young and youngest generations of Marxists was heard in a forum broader than one school or institution. Among the participants in the discussions there were also practitioners, active members of youth organizations. The organizers of the meeting associated a number of different goals with their initiative, among which certainly not the least important are integrating a group which is not very large, becoming better acquainted and exchanging experiences, ideas and concerns. These aspiration are major and necessary, not only for young people.

Conference Promotes Adult Education

Warsaw ZYCIE WARSZAWY in Polish 22 Nov 85 p 2

[Text] Proceedings of the Ninth National Congress of the Society for the Popularization of Culture [TWP], the largest organization in Poland that deals with adult education, began 21 November in Warsaw. The TWP, established in 1950, grew out of the progressive traditions of the Society of Workers' Universities and the Society of People's Universities. It presently brings together over 40,000 members--popularizers of various areas of knowledge and organizers of educational activity. During the almost completed four-year term of lectures and meetings, of which there were nearly half a million, over 17 million students participated.

Delegations from TWP groups from throughout Poland came to the Ninth Congress. Guests of honor at the congress were Zenon Komender, vice-chairman of the State Council, Prof Zbigniew Gertych, vice-president of the Council of Ministers, Prof Tadeusz Porebski, PZPR Politburo member, Prof Henryk Bednarski, PZPR Central Committee secretary, representatives of the ZSL and SD, the PRON National Council and several ministers.

Prof Janusz Gorski, TWP president, presented the program's report to those attending. Prof Gorski began with the statement that the passing term has been one of difficult choices. They resulted not only from the socio-economic crisis of the early 1980s but also from unfavorable changes in the consciousness of part of society. In choosing the programmed line, TWP was guided by the notion of national understanding, the support of rational attitudes and attempts to overcome passivity.

At the beginning of the 1980s the society experienced a period of decline marked by a drop in the number of members and a limitation of activity. The number of lectures during the 1981/82 academic year fell by half in relation to 1980, while the number of permanent centers decreased by two-thirds. Likewise the number of clubs declined. However, just two years later the society achieved a scale of activity similar to TWP's best year in 1979. In the most recent school year the society's activity was more intensive than in any previous period of its existence. TWP ran 4500 permanent education centers, almost 3800 courses and 1800 clubs, while instructors gave 158,000 lectures. Almost 7 million people participated in all forms of TWP's work. A tripling of the society's income over the past four years also permitted effective resolution of the problems of TWP's paid employees and lecturers and permitted rectification of instructors' rates, which had not been adjusted for some time. The proportion of subsidies in the society's funds also decreased.

In recent years the forms of work have also been changing. The concept of establishing an open university in Poland as a higher school to supplement the present educational system, the first among the socialist countries, has been worked out. Some of the public universities have been subject to modification. They have been altered in the educational and cultural centers that play a major role in the society. Experiments such as the Community Public University (in Uscinow near Lublin) or the Multidepartmental Public University (in the "Telkom" plant in Poznan) have been undertaken.

Politburo member Prof Henryk Porebski, in his speech to TWP Ninth Congress delegates, expressed appreciation to the society, which operates in support of shaping positivistic attitudes, rational activities and organized work, which has not been easy, especially in recent years. A fundamental problem for the immediate future is drawing those social groups who remain passive into TWP activity.

Many of the delegates to the congress spoke about a model for disseminating knowledge in worker and rural centers. Delegates from similar societies for the spread of knowledge and education in socialist countries presented their own experience from that activity.

Tomorrow the second day of proceedings.

SEJM ADMINISTRATION, GOVERNMENT ACTIVITIES

Malinowski on Efficient Government

Warsaw RZECZPOSPOLITA in Polish 18 Nov 85 pp 1,2

["Directions of Action of the Ninth Session of the Sejm" -- PAP report, subtitled "Roman Malinowski at Center for Postgraduate Training of Government Employees"; passages within slantlines printed in boldface]

[Text] /(C) On 16 [November 1985] Speaker of the Sejm Roman Malinowski met with the faculty and students of the Center for the Postgraduate Training of Government Employees. During the meeting the speaker touched upon problems relating to the operation of our supreme deliberative body as well as upon activities of the government./

He offered the reminder that the main directions of action of the Ninth Session of the Sejm are conditioned by economic problems. In this field the parliament faces the vital task of accepting a 1986-1990 national socioeconomic plan in which the requirements of the economic reform would mesh with the socioeconomic aims of the country. The choice of the ways and means facing the Sejm in this connection will not be easy.

/The anticipated changes in the work of the Sejm relate not only to shifting the point of gravity from the legislative to the control function of this supreme deliberative body./ This also concerns, the Speaker stressed, the further strengthening of the bonds between the deputies and the voters as well as refinements in the performance of the Sejm's bodies.

Much attention was devoted to problems of the functioning of the government. These days, R. Malinowski pointed out, /changes have taken place in the functioning of certain central bodies of the government. This is the second time the changes are happening on such a scale in the last few years, but additional changes are also to be expected in measure with the application of the [economic] reform, which after all requires modifying the administrative structures. A general principle for perfecting the democratic processes is the departure from the system of centralized administration and the delegation of powers to self-government bodies./ The changes taking place in the central administration are of a similar nature. The operating mechanisms of local government are being strengthened, although practice still leaves much to be desired in this respect. Hence, local administration should pay more attention to cooperating with self-government and socio-occupational bodies in their areas. This concerns chiefly co-participation in decisionmaking. The state of public administration is affected by the consequences of the socioeconomic situation. In such conditions, the efficiency of administration is considerable.

Public Administration Improvement Goals

Warsaw RZECZPOSPOLITA in Polish 21 Nov 85 pp 1,5

[Report signed (FOR): "To Administer Means to Serve the State and the Citizens; Conference of Academicians and Practitioners Attended by Prime Minister Zbigniew Messner"; passages within slantlines printed in boldface]

[Text] /(Own information) (C). On 20 November of this year a 2-day conference on the role of the code of administrative proceedings in streamlining the activities of government offices came to an end at the URM [Office of the Council of Ministers]./ The plenary session, chaired by Professor Zygmunt Rybicki, undersecretary of state at the URM, was attended by Prime Minister Professor Zbigniew Messner. The participants included representatives of the Supreme Administrative Court, law experts from academe and government employees of varying rank.

Prime Minister Zbigniew Messner stressed that the conference is not just an occasion for assessing the code of administrative proceedings on the 25th anniversary of its promulgation but also a symbol of the administration's desire to streamline the performance of government offices.

Prime Minister Messner continued: "In my Sejm address I emphasized the great importance attached by the government to knowledge of the law, selection of government employees and governmental controls, as well as the importance of a positive attitude of officials toward clients. /We want to have government employees who not only are knowledgeable but display an unassuming and affable attitude toward citizens/ in any situation, even when a matter has to be settled unfavorably to the client. For it is not enough for a government official to declare: 'It's not permitted' or 'Not available.' A positive attitude toward clients is also reflected in the manner in which they are informed of decisions. Let us bear in mind that the government employee is the actual /executor of the state's policy in his community. The attitude of citizens toward the authorities also depends on the public's evaluation of his attitude. Our administration must be coherent in implementing the policies of the authorities and serve the citizens./

Next, the prime minister continued: "Thus, if we demand so much of government employees, we have to bear in mind all the factors encouraging them to upgrade their qualifications and participate in a positive selection of civil service personnel. The achievements of this conference and the intellectual stir it germinated should be creatively utilized to promote these ends."

The plenary session began with reports on recommendations made at yesterday's sessions of the sections, at which the participans stressed the topicality of the code of administrative proceedings, which is considered to be "a politically rational and legislatively sophisticated" code.

Although the code of administrative proceedings is a durable work, it requires continual verification. In this connection, marked differences of opinion arose among experts. Some propose that it be amended with provisions corresponding to the new nonclassical functions of the administration, such as, e.g., rationing benefits. Other discussants cautioned against hasty revisions and an excessive expansion of the list of cases subject to judicial consideration as well as against exceeding the permissible threshold of "proceduralization." A lively discussion lasting several hours dealt with the application of the code of administrative proceedings to economic matters, e.g., as regards disputes between enterprises and their parent agencies and compensation for the economic losses incurred by implementing verdicts that are appealed upon and subsequently voided.

/The role of the NSA [Supreme Administrative Court] as the guardian and interpreter of the code was repeatedly stressed./ In this connection, it was pointed out that certain government employees attempt a kind of evasion from to the judiciature. Hence, to protect the interests of the citizens, the need to extend NSA verdicts to decisions issued in a different form owing solely to fear of having them appealed was pointed out.

The discussion also included many topics of an organizational nature. With reference to the prime minister's address, proposals were made to restructure the system for training administrative employees and establish specific qualifying standards for the exercise of administrative posts. An improved popularization of the code of administrative proceedings not only among government employees but also among the entire society was also postulated.

Constitutional, State Tribunals Begin

Warsaw ZYCIE WARSZAWY in Polish 21 Nov 85 pp 1, 2

["Constitutional Tribunal Begins Operation, State Tribunal Opens" -- PAP report]

[Text] (P) Concurrently with the inauguration of the Ninth Session of the Sejm a new institution in our legal-parliamentary system, the Constitutional Tribunal, is commencing its activities. The weeks remaining till the new year, when it will begin to operate formally, will be filled with preparatory and organizational work.

On 20 [November 85] the speaker of the Sejm Roman Malinowski handed letters of appointment to members of the Constitutional Tribunal. He stated that they constitute the membership of the first ever tribunal in Polish history to be established for the purpose of evaluating the consonance between the law and the Constitution. He also stated that the need to assure this consonance has always prevailed in the legal doctrine of the PRL, but this view has not always been fully reflected in the daily operations of the government. The creation of an institutional safeguard that genuinely assures real consonance with the constitution and the provisions of all normative acts, particularly those issued by the public administration, will help promote socialist democracy and a more effective implementation of portentous tasks such as, e.g., the economic reform.

The formation of the Tribunal will strengthen the confidence of citizens in the legal norms established by the state bodies. According to the Speaker, the Decree on the Constitutional Tribunal is one of the most valuable of the numerous legislative accomplishments of the Ninth Session of the Sejm. Referring to the difficult tasks of the Tribunal, whose proper accomplishment is awaited not only by the Sejm but by the entire society, the speaker voiced the conviction that the attitude of the judges of the Tribunal will be marked by a principled approach, service to the Constitution and uncompromising concern for the full implementation of the Constitutionally established legal principles of our system of society.

The Sejm expects of the Tribunal that it will not only monitor the Constitutionality of the laws in force but also provide general comments on the state of the law as well as information on needed implementing regulations relating to fundamental Constitutional norms.

The members of the Constitutional Tribunal were sworn in.

Also on Wednesday, the members of the State Tribunal were sworn in, after R. Malinkowski handed them their letters of appointment. The Speaker emphasized the importance of the State Tribunal as an institution that is to consolidate the role of law and order and whose special purpose is to focus on the principle of personal responsibility of the individuals holding highest state offices for an exercise of power that is consonant with the Constitution and the laws. Working people in Poland desire to have the certainty that the common national wealth generated by their effort shall not be dissipated through carelessness or incompetence.

The Speaker declared that much has already been done to meet these social expectations, democratize the system of society and consolidate the rule of law -- although undoubtedly the initiated lawmaking processes have yet to be continued and expanded. The Ninth Session of the Sejm shall consistently progress in that direction, according to the speaker, who added that, by its very existence, the State Tribunal shall constitute a factor perpetuating the Constitutional rule and law and order, moral and legal, that apply and should apply at all levels of the exercise of power in People's Poland, and particularly at the supreme levels.

At both meetings with members of the tribunals, deputy speakers of the Sejm were present.

Sejm Deputies Clubs Meetings on Budget

Warsaw RZECZPOSPOLITA in Polish 27 Nov 85 p 5

["Meetings of Deputies' Clubs" -- PAP report; passages within slantlines printed in boldface]

[Text] /(C) On 26 [Nov 85] the Sejm deputies' clubs held meetings./

/At the meeting of the PZPR Deputies' Club the continuing work on the main directions of the club's activities during the Ninth Session of the Sejm was considered./ In addition, proposals of the PZPR Deputies' Club submitted to the Presidium of the Sejm with the object of enriching Sejm deliberations were considered. Bylaws of the club were agreed upon. The amount of contributions to the party fund from the deputies' pay was determined.

/At Tuesday's meeting certain economic and financial problems were discussed. The 1986 Central Annual Plan was considered. Characterizing it, Deputy Manfred Gorywoda, the chief of the Planning Commission, pointed out that this plan represents the beginning of the future 5-year plan./ He stressed the effect of the results of this year on next year's tasks and economic situation. In that context, he pointed to the major importance of three issues: the incomplete implementation of the policy of restoring the commodity-money equilibrium, the lower-than-anticipated exports to the capitalist countries and the higher-than-anticipated investment outlays. He emphasized that qualitative growth factors are acquiring an increasing importance and stress should be placed on them next year. /As regards social problems, the 1986 Central Annual Plan assumes, among other things, an increase (by 2.5 percent) in consumption, increases in pensions and annuities, and higher nursery and school enrollment./

Aspects of the projected budget for the next year as well as of other financial plans, including draft decrees that will be submitted to the Sejm on Wednesday, also were discussed. Among other things, the need for more effective price policies was stressed. Attention was drawn to the need for solutions enhancing the interest of enterprises in the application of technological progress and expansion of exports.

The deliberations were chaired by Tadeusz Porebski.

/At the meeting of the ZSL [United Peasant Party] Deputies' Club, whose deliberations were attended by the Chairman of the ZSL Supreme Committee Roman Malinowski, the discussion focused on the assumptions of the draft state budget./ Among other things, the need for a precisely defined concept for halting inflation and regularizing the state's fiscal operations was pointed out. For example, a greater curtailment of budgetary subsidies was supported. /It was emphasized that halting inflation is of fundamental importance to a more effective solution of social problems./

As regards agriculture and food management, the assurance of adequate funds for the development and, above all, modernization of the agricultural and food industries, land reclamation, and rural water supply was postulated. Other topics of the dicussion pertained to the need for further refinements of the agricultural insurance system as well as to the question of assuring a parity of farm and nonfarm incomes. Of the current topics the most important one was thought to be the solution of the problem of rural coal supplies. The deliberations were chaired by Tadeusz Szelachowski.

/During the deliberations of the SD [Democratic Party] Deputies' Club the deputies familiarized themselves with the basic assumptions of the 1986 Central Annual Plan and the basic problems of the state budget for the next year./ Representatives of the Planning Commission under the Council of Ministers and of the Ministry of Finance, who were present at the meeting, answered many specific questions from deputies who, e.g., were curious about the intent of fiscal policy toward the crafts industry, which is of great significance to its development. Anxiety was voiced about the monopolization of certain fields of the economy, and other questions raised concerned ways of financing cultural activities from local budgets, effective methods of combatting inflation, shortages of investment and capital-reproduction funds in trade and petty industry, and imbalances between the plans for the production of building materials and the construction plans. The deputies also were interested in, among other things, the application of principles of the economic reform to enterprises nearing bankruptcy as well as restrictions on producers who unjustifiably jack up prices.

/Aspects of the plenary session of the Sejm scheduled for this coming Wednesday were discussed, as were the plans of work of the Chamber and the SD Deputies' Club for the immediate future. The deliberations were chaired by Marek Wieczorek./

National Defense Commission Meeting

Warsaw TRYBUNA LUDU in Polish 27 Nov 85 p 2

["Activities of the Sejm Commission for National Defense" -- PAP report]

[Text] /On 26 [Nov 85] was held a session of the Sejm Commission for National Defense/. Representatives of the heads of the Ministry of National Defense briefed the commission about selected aspects of the military threat to our country, the structure and tasks of the PRL Armed Forces and the nation's defense system and its operation. During the discussion the deputies received additional explanations. Emphasis was placed on coordinating defense policies with the country's overall development as well as on the army's participation in work promoting the national economy, and a system of rational management of the armed forces was discussed along with its effects. Deputy Henryk Jablonski chaired the meeting.

PROVINCIAL DEFENSE COMMITTEE MEETINGS

Katowice Defense Committee

Katowice TRYBUNA ROBOTNICZA in Polish 24 Oct 85 pp 1, 2

[Article by Jerzy Miemiec: "The Constant Struggle With Thievery on the Railroads"]

[Text] There is no leniency in cases of thievery on the Polish State Railroads nor will there be, regardless of who commits it. The Provincial Defense Committee (PDC) in Katowice at its 14 August meeting took an extremely strong stand on the status and effectiveness of plans being implemented by the Silesian District Directorate of State Railroads (DDSR) to safeguard the property being hauled by the railroads. It is requiring that a verified, concrete program be developed which, when it is instituted, will visibly improve the situation.

Yesterday, the 23rd, the PDC at a meeting conducted by its vice-chairman, Gen Bde Jan Lazarczyk, chief of the Provincial Military Staff, again discussed this very important, from an economic and social point of view, problem.

The extensive program, presented by the Silesian DDSR and the district task force for the safeguarding of property and the counteraction of thievery on the State Railroads, which had been coordinated earlier with the Provincial Internal Affairs Office and the Provincial Prosecutor General's Office, was approved this time along with its supplements.

The list of specific measures, some of which, according to Kazimierz Drozd, assistant managing director, chairman of the Silesian DDSR Anti-Theft Task Force, have already been put into effect, is truly long. A number of meetings have been held in the most vulnerable State Railroads stations and junctions with representatives of the prosecutor's office, the militia, the PZPR Factory Committees, and the trade unions, in attendance. To set an example and as a deterrent, railroad employees who steal cargo and State Railroads property, will be tried on station grounds by collegial courts, with railroad crews attending the trials. "Blockade"-type campaigns will continue to be conducted regularly by the Citizens Militia, the Volunteer Reserve of the Citizens Militia, and Polish Army soldiers. Before referring persons for jobs on the railroads, the employment offices will consider the individual's past record.

Prizes will be awarded to those employees who do outstanding work in safeguarding property and revealing crimes, and part of the salaries paid to those who manage and supervise the stations will, according to the program, depend on "elimination of transport irregularities which facilitate the occurrence of thievery." The names of State Railroads employees who committed thefts and the punishment administered, will be made known to the railroad workforces.

Cars and trains carrying valuable cargo will be given greater protection and the work of investigation teams will be intensified.

The list of measures already partially implemented is long. But the fact is, and those who took part in the discussion, including Gen Bde Ryszard Szuster, head of the Provincial Internal Affairs Office, Jan Zielinski, PZPR Provincial Committee secretary, and Stanislaw Ganszczyk, deputy provincial prosecutor general, called attention to it, that despite some improvement the number of crimes and their detection is still very disturbing. Thus elimination of the causes of this state of affairs is a priority task.

The PDC has assigned the Silesian DDSR the task of regularly examining the security of property against theft and destruction during transport.

The PDC also discussed defense problems, heard a report on the sociopolitical situation, the state of law and order in the province, and how the needs of the armed forces and civil defense are being met.

Krakow Defense Committee

Krakow ECHO KRAKOWA in Polish 30 Oct 85 p 2

[Text] The Provincial Defense Committee in Krakow met yesterday. The meeting was chaired by Mayor Tadeusz Salwa.

Problems of housing construction and the present status and prospects for expansion of telecommunications in Krakow and in the province were discussed.

The committee acquainted itself with the current state of law, order and public safety..

Skierniewice Defense Committee

Skierniewice WIADOMOSCI SKIERNIEWICKIE in Polish 14 Nov 85 p 2

[Text] Last week in Skierniewice the Provincial Defense Committee (PDC) held a meeting which was attended by the PZPR Provincial Committee secretary, J. Marchew and conducted by Governor K. Borczyk, PDC chairman. The state of the fighting readiness of fire departments in the province was assessed.

The materials submitted by PDC members and the additional information supplied by the chief of the Krakow Province Fire Department, A. Piatkowski, showed that there has been distinct progress in equipping fire departments with firefighting equipment and vehicles. Training and preventive work has also improved. Regional Volunteer Fire Brigade facilities are also expanding. Six new lookout stations have been put into service and 26 more are being built. Preliminary work has been begun on construction of a provincial lookout station which is to be completed in 3 years. The efficiency of fire departments will improve and response time to fires will be further shortened by a new system of radio-activated sirens. The efficiency of firefighters is also being improved through a system of drills and contests.

The PDC also assessed the results of the recruitment of youth to professional military schools. It was found that the quota assigned to the Provincial Military Staff was filled and even exceeded. Meetings of young people with Polish Army officers, organized trips to officers schools, and "open barracks" days, turned out to be very useful in acquainting the young people with the nature, conditions and work of the Army.

The participation of the teaching cadre of the junior high schools was given a high rating, emphasizing that information on the military profession should be expanded through collaboration with the Polish Scout Union. Friendly contacts between Higher Officers School students and their young high-school colleagues would also be valuable.

The PDC members next heard reports on the safety and public order in the province. They learned that during the first three quarters of this year the crime rate dropped, and particularly crimes against life and property. The crime-detection index rose, especially crimes relating to bootlegging and speculation. But the high crime rate among juveniles is disturbing, as is economic crime, with large numbers of persons failing to make alimony payments. Traffic accidents continue to be a menace, caused mainly by drunken drivers and careless pedestrians.

BRIEFS

PRON GRUNWALD COMMITTEE--On 28 January 1986 Kazimierz Barcikowski, deputy chairman of the Council of State and chairman of the National Grunwald Committee, met with a delegation of government officials from Olsztyn Province and the first secretary of the PZPR Olsztyn Province Committee, Jan Laskowski. The chairman of the Citizens' Grunwald Committee in Olsztyn, Edumund Wojnowski, reported on the work the committee has accomplished to date. The ensuing discussion centered around the tasks facing the National Grunwald Committee, which was created in response to a resolution passed by the PRON National Council. SZALAJDA SEES BROVIKOV--On 30 January 1986 Vice Premier Zbigniew Szalajda met with the USSR Ambassador Vladimir Brovikov. [Text] [Warsaw TRYBUNA LUDU in Polish 31 Jan 86 p 2] /8918

SOVIET ENVOY AT FRIENDSHIP SOCIETY--On 30 January 1986 a meeting was held between the executive staff of the Polish-Soviet Friendship Society National Board and the USSR Ambassador Vladimir Brovikov. The chairman of the Polish-Soviet Friendship Society National Board, Stanislaw Wronski, reported on the society's activities and current tasks. The status of cooperation between the Polish-Soviet and Soviet-Polish friendship societies was discussed. [Text] [Warsaw TRYBUNA LUDU in Polish 31 Jan 86 p 2] /8918

PRON APPEAL ON PRISONER RELEASE--On 30 January 1986 the collegium of the PRL Prosecutor's Office reviewed, inter alia, a report on the response of the PRL Prosecutor's Office to the PRON humanitarian initiative concerning the release of persons imprisoned for so-called non-criminal offenses. It was concluded that action by the prosecutor's office in response to this initiative has been proceeding in a proper manner. In accordance with the wishes of the PRON National Council Executive Committee, the Posecutor General's Office forwarded to the committee a detailed listing of persons released from custody so as to enable PRON authorities to exercise a rehabilitative influence over these persons in order to forestall their becoming repeat offenders. [Text] [Warsaw TRYBUNA LUDU in Polish 31 Jan 86 p 2] /8918

PZPR 10TH CONGRESS PREPARATIONS--On 3 February 1986 the PZPR Central Committee headquarters was the site of a conference party provincial committee secretaries devoted to a discussion of ideological and public relations problems associated with preparations for the PZPR 10th Congress. The participants discussed key tasks related to the general pre-congress news and public relations campaign and in particular to the debate on the draft version of the party platform, the congress issues agenda, the plans of the mass communications media, and key problems in the field of the arts. The conference, which was chaired by PZPR CC Secretary Henryk Bednarski, as attended by Jan Glowczyk, candidate member of the Politburo and CC Secretary. [Text] [Warsaw TRYBUNA LUDU 4 Feb 86 p 2] /8918

MEDIA BRIEFING ON 24TH PLENUM--Critical issues discussed at the 24th Plenum of the PZPR Central Committee were the topic of a meeting held on 3 February 1986 with press, radio and television correspondents from the socialist countries and the press attaches of the embassies of these countries in Warsaw. Briefings on the proceedings of this plenum were presented by Boguslaw Kedzia, director of the PZPR CC Department for Science, Education, and Scientific and Technological Progress, and Leszek Miller, director of the PZPR CC Department for Youth Affairs, Physical Education, and Tourism. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Feb 86 p 2] /8918

SOVIET-POLISH TRADE UNION COOPERATION--On 3 February 1986 OPZZ Chairman Alfred Miodowicz met with the director of the Foreign Department of the Soviet trade union national organization, Vladimir Sergeyev. Information was exchanged on the activities and cooperative ventures of the union movements of the two countries. The importance of lending support to the disarmament program as spelled out in the Mikhail Gorbachev Plan was emphasized. V. Sergeyev also met with the Stanislaw Gabrielski, director of the PZPR CC Department for Social and Trade Union Affairs. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Feb 86] /8918

VISITING SOVIET TRADE UNIONISTS--A delegation of the Auditing Commission of the All-Union National Council of Trade Unions headed by the commission chairman, Lidia Kubiak, arrived in Poland on 3 February 1986 for a visit. The purpose of the visit is to share information and experience on the work being done by the statutory bodies of both national trade union movements, the OPZZ and the All-Union National Council, with special emphasis on the working techniques of audit, inspection and financial bodies. [Text] [Warsaw TRYBUNA LUDU in Polish 4 Feb 86 p 2] /8918

RADIOACTIVE MATERIALS THEFT--At the Wroclaw thermal electric power plant persons unknown have stolen two smoke detectors that were installed in a special tunnel. These "DIO-30" detectors are complex devices whose design and performance involves the use of radioactive materials. The investigation of this case is being conducted by the local provincial office of internal affairs. Experts warn that the levels of radioactivity in these detectors may be a hazard to health or even life threatening, especially so in the event that the detectors are disassembled. [Text] [Warsaw ZYCIE WARSZAWY in Polish 4 Feb 86 p 2] /8918

SMUGGLED PRINTING EQUIPMENT INTERCEPTED--During a customs inspection at the Olszyn (Zielona Gora Province) border crossing of a truckload shipment from the FRG to the Roman Catholic St Jan Bosco parish in Poznan customs inspectors discovered in the truck a duplicating machine, paper, carbons, and duplicating fluid that were not registered on the bill of lading. This illegally transported printing equipment was part of a shipment of gifts that included items such as used beds, matresses, cabinets, footwear, apparel, and medicines. The shipper was identified as the Catholic parish of Kressbronn, FRG. This case is being investigated by the Zielona Gora Province Prosecutors Office. [Text] [Warsaw ZOLNIERZ WOLNOSCI in Polish 5 Feb 86 p 5] /8918

NICARAGUAN NATIONAL ASSEMBLY GROUP VISIT--Warsaw, 19 Feb--A delegation of the Nicaraguan National Assembly arrived here today for a few-day visit. Members of the delegation, deputies of the Sandinista National Liberation Front, Julio Marenco and Jaime Onil Perez are guests of the Sejm, with which the Nicaraguan parliament has been developing more and more fruitful cooperation. The Nicaraguan guests have paid a call on depty Sejm speaker Mieczyslaw F. Rakoswki and presented him with information on the political and economic situation in their country. They stressed that last years' elections to the National Assembly, won by the Sandinista National Liberation Front, were an important event in strengthening the Nicaraguan revolution. The working out of a new constitution, to replace the current provisional one, is one of the most important tasks of the new parliament, said the guests. The Nicaraguan guests also spoke on the constant need of strengthening the achievements of the revolution in their country. They stressed that it depends not only on the attitudes and aspirations of the Nicaraguan people, but also on the understanding and support for the Nicaraguan cause of mainly the socialist countries and also other countries. /Text/ /Warsaw PAP in English 1710 GMT 19 Feb 86 LD/ 12228

BORDER GUARD KILLED ON DUTY--The funeral of a soldier of the Border Guard, Private Krzysztof Gesiarz, who was killed 4 days ago while carrying out his duties, took place in Biala, Czestochowa Voivodship. The border guard was pushed into the port canal at Kolobrzeg by a Danish sailor who wanted to come onto his ship without producing documents. After mass in the parish church, the coffin containing the body of Krzysztof Gesiarz, escorted by a guard of honor, was carried to the cemetery. The deceased was accompanied by members of his immediate family, comrades and superiors from the army, representatives of the Czestochowa Voivodship authorities, and by inhabitants of his home village. /Text/ /Warsaw Domestic Service in Polish 2200 GMT 15 Feb 86 LD/ 12228

USSR CULTURAL AGREEMENT--At the Ministry of Culture and Art an agreement has been signed on cooperation in cinematography between the USSR and Poland this year. On the Polish side the agreement was signed by Deputy Minister Jerzy Bajdor (SMCLN) while the Soviet side was represented by deputy chairman of the State Committee of the Soviet Union for Cinematography, Mikhail Aleksandrov. /Excerpt/ /Warsaw TV Service in Polish 21100 GMT 5 Feb 86 LD/ 12228

FUNGAL INSECTICIDE--Polish scientists have found an efficient, yet safe way to fight the Colorado beetle and protect people and animals. A species of Funus named baveria Bassiana has become man's ally in the struggle against the Colorado beetle. As laboratory tests have shown, its spores completely destroy the beetle's eggs, larvae and adult specimens. The problem consists in selecting a prepared substance suitable for universal use with an effectiveness equal to that of the fungus itself. Several years of efforts by scientists at the Institute of Ecology of the Polish Academy of Sciences in Dziekanow Lesny near Warsaw have ended in success. At the Polfa Pharmaceutical works in Pabianice, the technology of production of the substance on an industrial scale has already been developed. It is now undergoing the final tests. /Excerpts/ /Warsaw TV Service in Polish 2110 GMT 5 Feb 86 LD/ 12228

ACCORD WITH CSSR WRITERS--An agreement defining principles of cooperation in 1986-87 between the Union of Polish Writers (ZLP) and the Czechoslovak Union of Writers has been signed. The agreement envisages an increase in exchanges between the two unions. /Text/ /Warsaw Domestic Service in Polish 2300 GMT 3 Feb 86 LD/ 12228

WARSAW WRITERS MEETING--A general meeting of the Warsaw branch of the Union of Polish Writers (ZLP) has taken place in Warsaw. Krzysztof Gasiorowski was elected chairman. He had been elected chairman of the Warsaw branch in February 1984. This function was entrusted today to him again. /Excerpts/ /Warsaw Television Service in Polish 2025 GMT 30 Jan 86 LD/ 12228

CIVIC MILITIA MEETING--The activity of the Social Committee of the Voluntary Reserve of the Civic Militia (ORMO) has been revived in Janowiec Wielkopolski. The first secretary of the PZPR municipal-parish committee in Janowiec Wielkopolski, Zbigniew Zajaczek, was elected chairman. The composition of the Janowiec ORMO committee also includes some of the directors and heads of the local works enterprises. Preparations for celebrating the 40th anniversary of the movement were discussed. /Text/ /Bydgoszcz Domestic Service in Polish 0600 GMT 31 Jan 86 LD/ 12226

PROVINCIAL PZPR CONFERENCE--On 13 February 1986 Politburo member and PZPR CC Secretary Marian Wozniak chaired a meeting of provincial party secretaries devoted to a discussion of critical problems affecting social policy and collaboration between the PZPR and the trade unions and workers self-management council in the implementation of these policies. It was emphasized that the trade unions and workers councils have an important role to play in the process of implementing economic reform, enhancing economic performance efficiency, encouraging civic involvement in activities dedicated to industrial rationalization and innovation, resources conservation, and boosting the quality of industrial production. It was concluded that the work to be done by the trade unions and workers councils should serve to help increase worker understanding of economic affairs, encourage their more active involvement in civic and plant affairs, and reinforce the role played by the working class as a conscious protagonist in the process of economic planning and management. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /8309

SOVIET ENVOY WITH RAKOWSKI--On 13 February 1986 USSR Ambassador Vladimir Brovikov paid a visit to the Vice Marshal of the Sejm, Mieczyslaw F. Rakowski in connection with the onset of his diplomatic mission in Poland. On the same day Ambassador Brovikov also paid a visit to Sejm Vice Marshal Marek Wieczorek. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /8309

PZPR ROLE IN EDUCATION--A three-day seminar on education system problems for secretaries of teaching profession party committees and officials of PZPR provincial committees held at the Party Training Center of the PZPR Central Committee has come to an end. The participants discussed key problems affecting party work in the educational system. The main focus of attention was on efforts geared toward providing for the effective implementation of the resolution passed by the 24th Plenum of the PZPR CC. [Text] [Warsaw TRYBUNA LUDU in Polish 14 Feb 86 p 2] /8309

COOPERATION WITH SOVIET JOURNALISTS--The scope of cooperation between Polish and Soviet journalists is increasing with each passing year. To an ever increasing extent press, radio, and TV journalists from Poland and the USSR are participating in and reporting on major events taking place in both countries. In Poland there is growing interest in the Soviet press and publishing industry. This is attested to by the agreements signed every year between Workers Publishing Cooperative "Prasa-Ksiazka-Ruch" and its Soviet counterparts.

The importance of cooperation between Polish and Soviet journalists, especially so in view of the upcoming 27th Congress of the CPSU and the 10th Congress of the PZPR, was highlighted by candidate Politburo member and PZPR CC secretary Jan Glowczyk at the annual meeting with Soviet correspondents that was held on 14 February in Warsaw. Jan Glowczyk thanked the Soviet journalists for the work they have done in this country and wished them much success in their careers. The meeting, which was hosted by the chairman of the Workers Publishing Cooperative, Wieslaw Rydygier, was attended by the entire press corps. Representatives of the USSR Embassy were also in attendance. [Text] [Warsaw TRYBUNA LUDU in Polish 15-16 Feb 86 p 2] /8309

SIWICKI BRIEFED ON GDANSK SITUATION--Army General Florian Siwicki, candidate member of the Politburo and minister of national defense, has met in Gdansk with senior officials of the provincial government. Stanislaw Bejger, candidate member of the Politburo and first secretary of the PZPR Provincial Committee in Gdansk, gave a briefing on the local social and political situation, and Gen. Bde. Mieczyslaw Cygan, Gdansk Province governor, reported on the local economic situation. The meeting was attended by the chief of the Main Political Administration of the Polish Armed Forces, Gen. Div. Tadeusz Szacilo. [Text] [Warsaw TRYBUNA LUDU in Polish 15-16 Feb 86 p 2] /8309

GOMULKA COLLECTED WORKS--The editorial committee in charge of the publication of Wladyslaw Gomulka's "Collected Works" has held another meeting at PZPR CC headquarters. The committee met to discuss editorial policy for this edition and review a draft of the first volume. As a result of the discussions that they held decisions were made on the guidelines and scope of the work to be done by the team of authors hired to work on the initial volumes in the series, and recommendations were made on action to be taken with a view to improving and, at the same time, speeding up work on this edition. The committee decided to issue an appeal for everyone's help in gathering materials covered by the editorial program plan and decided that the first volume in the series would encompass the period from January 1943 to December 1945 and would be published next year. The meeting was chaired by CC Secretary Henryk Bednarski. [Text] [Warsaw TRYBUNA LUDU in Polish 15-16 Feb 86 p 2] /8309

SOVIET AMBASSADOR MEETING--On 14 February 1986 T.W. Mlynczak, chairman of the Democratic Party Central Committee and deputy chairman of the Council of State, met with the USSR ambassador, Vladimir Brovikov. [Text] [Warsaw TRYBUNA LUDU in Polish 15-16 Feb 86 p 2] /8309

CONGRESS BRIEFING FOR ZSL PRESS--Tasks facing the ZSL press in advance of the PZPR 10th Congress formed the topic of a meeting of senior editors and journalists that was held on 14 February 1986. Presidium member and Executive Committee member Kazimierz Kozub discussed editorial policy guidelines for the ZSL press during the pre-congress campaign. Deputy director of the PZPR CC Propaganda Department, Stanislaw Glen, gave a presentation on the progress of the pre-congress debate to date, the main premises of the PZPR draft Program, and the role of the media in publicizing this program. REGULATIONS FOR HANDLING OF PROP WEAPONS BY ARTISTIC UNITS

Bucharest BULETINUL OFICIAL in Romanian Part I No 6, 31 Jan 86 p 4

[Council of Ministers Decision Amending and Supplementing Council of Ministers Decision No 1369/1971 on Measures in Connection With the Handling of Weapons and Ammunition and for the Determination and Punishment of Violations in This Area]

[Text] The Council of Ministers of the Socialist Republic of Romania decides: Sole article—Council of Ministers Decision No 1369/1971 on measures in connection with the handling of weapons and ammunition and for the determination and punishment of violations in this area, republished in BULETINUL OFICIAL, Part I No 21 of 8 March 1976, is amended and supplemented as follows:

1. Paragraphs 3 and 4 of Article 10 will have the following content:

"Cultural-artistic associations which possess panoply weapons, as well as culture and art institutions which possess such weapons or prop weapons, will list in the registration application the number of weapons in their possession, the characteristics of each individual weapon, as well as whether or not they have been rendered harmless. Documentation will be attached to the authorization request in regard to those weapons which have not been rendered harmless since they are rare weapons or are of special historic, documentary, scientific, or artistic value.

The possessors of panoply or prop weapons specified in paragraph 3 are obliged to keep a record of these weapons in accordance with the instructions given by the militia organs."

2. A new paragraph, with the following content, is inserted in Article 31:

"Prop weapons are rendered harmless by stopping up the bore with two steel pegs riveted and welded to the outside of the barrel. These pegs will be placed so that only blank ammunition can be put in the cartridge chamber."

GRLICKOV STRESSES SAWPY ROLE IN NEW SYSTEMIC DEVELOPMENT

Belgrade BORBA in Serbo-Croatian 1-2 Feb 86 pp 1, 3

[Interview with Aleksandar Grlickov, president of the Federal Conference of SAWPY]

[Excerpts] [BORBA] Recently one can hear even more often the thesis that the revolution in our country is threatened. Do you believe this thesis is correct...?

[Grlickov] The economic and social crisis here has probably produced such a concern. Various anti-socialist phenomena and forces which have arisen and have partly succeeded in expanding the political area of their action have also probably had an effect on this.... However, this is not close to my view of our socioeconomic circumstances and their future. If one holds the thesis that the revolution is threatened, the question is immediately raised: "Which revolution? And how is it threatened?" ...and this thesis corresponds with another already official thesis, that the basic conflict in our country is between the forces of statism and those of socialist self-management; hence, not between revolution (which, I repeat, is not identified) and counterrevolution.

Why do I insist on asking which revolution is threatened? Does one have in mind here that every socialist revolution is authentic, self-aware, and an unrepeatable process, so accordingly biased and in a certain sense also one-sided? In this accepted and undisputed historical truth one should always keep in mind that there also exists the possibility of a dogmatization of its theoretical and political thought. Its [the revolution's] deformation begins, in fact, in this process. In answer to your question, I want to ask the following question: Is it a question of a threat to our revolution or is it a question of a deformation of the revolution as a result of its internal dogmatization?

The second thesis with which I want to defend my disagreement with the view that our revolution is being threatened is that it is known from history that every revolution has always expressed its own concrete historical limitations, from its inception throughout the stages of its development. This is a natural process of its development. In addition, the possibility for stagnation, the sharpening of social contradictions, and the differentiation of goals from practical action can also occur.

[BORBA] In public statements you have recently made you have insisted several times on the need to project a new stage in our development. What do you mean by this?

[Grlickov] The present model of industrialization and its priorities have exhausted their potential and require change. These changes must give more consideration to the requirements of the new technological revolution (oriented toward the medium- and small-scale economy in new branches and toward solving structural disproportions), as well as giving more consideration to new comparative advantages which we have created in the past period, that is a skilled labor force and accumulated knowledge as a whole among the large number of unemployed in the country as well as those who are abroad. I think the changes will require a new method of industrialization in a broad sense which will keep in mind the shortage of social [capital] accumulation and the hidden and unused potential of accumulation existing in private property. We have comparative advantages in cheap labor..., unused potential in agriculture, and the undeveloped tertiary sectors.

We have established that the existing institutional mechanism...is less and less able to solve the socioeconomic contradictions. Solutions are often therefore sought outside the system of ...self-management.

The new projected stage must remove the polyp of polycentralist or centralist etatism and disintegrative tendencies and divisions. It must create a new turn in development inspired by integration and homogenization. The basis for this is the action of the workers class, other working classes, and social groups in order to turn from stagnation to a unified market and mutual agreements..., but also to mutual competition.

Discussions about the...national economies, I agree, are becoming more frequent and bitter, but they are not yet over and will not be easily concluded as long as politics dominates economics so powerfully. These discussions will continue as long as direct producers do not have the material and institutional base to dispose of all surplus labor, as long as political decisions override the producers' decisions, and...as long as the entity responsible for the working class and national interests is not the working class itself but, rather, someone else acting in its name, such as a political bureaucracy.

The practice of national economies has opened up disintegrating processes with a strong potential toward autarchy, reaching into the OURs. These... are facts which cannot be overcome by political or ideological reform but by changes in the mechanism of the economic system and in the mechanism of the political system.

To develop the new content of political life it is important that all subjective forces of socialism, the LCY, SAWPY, the Trade Union Federation, Youth Organization, etc., form a real identity. Presently, none of them have their own strategic orientation. The LCY is integrated too much with the state and does not act to a sufficient degree as an ideological-political force through the regular mechanism of the political system on the public stage of political life. In regard to SAWPY and other members of the popular front, their role as a transmission line [of the LCY] and their own autonomous identity have been at variance.

Identity, and this means...independence and the free expression of the interests and ideas of its members, is an essential factor for developing a new quality in political life.

[BORBA] Can some changes be expected from the present elections?

[Grlickov] I have spoken quite a bit about the elections in the last few months, so I will only say that elections should radically change the class-social structure of the delegates in the delegate assemblies and sociopolitical organizations, expanding the possibilities for all socialist and self-management-oriented people, regardless of whether they are LCY members or not, Marxists or non-Marxists, theists or atheists. If the cadre composition of the political pyramid is not formed in this way, it is difficult to expect that intermediary interests will be suppressed and that [elections]...will also be the framework for a new quality of political life.

There is no new quality of political life without the real role of the Socialist Alliance, as the front of all organized socialist forces. Now we do not yet have such a Socialist Alliance. There are still vacillations and resistance in political practice. The criticism that SAWPY is still carrying out a transmission-line role...is correct.

[BORBA] And the League of Communists?

[Grlickov] In reality, of course, channels and potentials have been released so that forces are appearing in the LCY which are drawing the party into a traditional political party, i.e., into the traditional one-party system in regard to the methods of its action. On the other hand, there are signs that the outcome of the...contradiction is being sought in a traditional multiparty organization; as if our problems will be easier to solve with two parties, the LCY and a Socialist Party, for instance, if this is, in general, realistic in our multinational and multiconfessional society. Our answer is along a positive historical line, namely, that under our conditions neither the classic one-party nor the multiparty system is appropriate. At the same time, as is known, our answer is not reality [stvarnost], it does not communicate intimately with reality.

Therefore, when we speak about the place and role of the Socialist Alliance as a front for all organized socialist self-management forces we are, in fact, speaking about the existential question of our self-management socialism and multinational society. I am not sure that everyone understands this very important truth--which is partly the result of our historical essence and partly the conviction that in our basic orientations there is a stalemate in forming self-management socialism under our conditions.

I must say, finally, that knowledge and both political and moral courage are necessary to create this new projected stage. We...need knowledge and moral and political courage to decisively meet the challenges of the present without the complexes of the past, to meet the goal of changing the present and controlling and forming the very uncertain future.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

SUMMARIES OF MAJOR EINHEIT ARTICLES, JANUARY 1986

East Berlin EINHEIT in German Vol 41 No 1, Jan 86 (signed to press 10 Dec 85) pp 2, 96

[Summary of article by Prof Dr Helmut Koziolek, member of the SED Central Committee, director of the SED Central Committee's Central Institute for Socialist Economic Management, chairman of the economic sciences research council, member of the Academy of Sciences, GDR, and member of the EINHEIT editorial board; pp 12-20. A full translation of this article is published in this report]

[Text] Linking Science With Production

Implementing the new phase of the economic strategy compellingly necessitates a closer economic link between science and production. What objective measures must then be met? From which experiences, gained in the combines, must general rules be drawn so that, relying on basic research data, scientific-technical top achievements are to be attained and are swiftly converted into new products and technologies in being as well utilized economically as possible? What expresses the growing weight of the subjective factor in dealing with the tasks to be solved?

[Summary of article by Prof Dr Wolfgang Biermann, member of the SED Central Committee, general director of the VEB Carl Zeiss JENA Combine; pp 21-27. A full translation of this article is published in this report]

[Text] The Combine's Scientific Potential

Closely linking the combines' science and research potentials with their economic cycles has turned out to be a highly beneficial and efficient form for achieving scientific-technical top performances high in economic yield. Which experiences can the VEB Carl Zeiss JENA Combine furnish in this regard? How, by using the advantages of socialism, are the potentials of the science institutes, the universities, and of socialist economic integration being exploited and the opportunities inherent in mission-related research being utilized?

[Summary of article by Prof Dr Norbert Langhoff, director of the Center for Scientific Equipment Construction, Academy of Sciences, GDR; Prof Dr Harry Maier, deputy director of the Institute for Science Theory, History and Organization, Academy of Sciences, GDR; and Dr Klaus Meier, associate at the same institute; pp 28-34]

[Text] Research Techniques Striving for Top Positions

While seeking top positions in basic research and the mastery over and swift economic conversion of key technologies, efficient research techniques are becoming increasingly important. Buying them on the world market would mean getting pre-programmed for lagging behind. All the greater are the efforts that are needed to produce modern science equipment ourselves. How can research institutes and combines expand, coordinate, and still more efficiently use their opportunities for it?

[Summary of article by Harry Groschupf, GDR deputy minister for University and Technical School Affairs; pp 35-39. A full translation of this article is published in this report]

[Text] Technical Schools--Centers of Cooperation Between Science and Production

What are the Technika? How do they function as centers for the economic linking of science with production? Examples demonstrate how in the Technika, especially in basic research, the potentials of the universities and of the combines work together, how they contribute to hastening the conversion processes, and how the unity of teaching, research, and practice is brought to realization there.

[Summary of article by Prof Dr Heinz Vosske, head of the central party archives at the SED Central Committee's Marxism-Leninism Institute; pp 40-46]

[Text] Wilhelm Pieck--A Life Devoted to the Working Class and All the People

The name and struggle of this outstanding leader of the German and international workers movement embody the best traditions of the revolutionary German workers movement and the rise of the workers class from a suppressed and exploited class to the one that exercises the power in our country. As a trustee and leader of his class, Wilhelm Pieck's way through six decades of resolute struggle against imperialism and war, and for peace and socialism, led to his becoming the top representative of the GDR, in which that became real for which generations of the best parts of our people had been struggling.

ECONOMY GERMAN DEMOCRATIC REPUBLIC

LINK BETWEEN RESEARCH, INDUSTRIAL PRODUCTION VIEWED

East Berlin EINHEIT in German Vol 41 No 1, Jan 86 (signed to press 10 Dec 85) pp 12-20

[Article by Prof Dr Helmut Koziolek, member of the SED Central Committee, director of the SED Central Committee's Central Institute for Socialist Economic Management: "Linking Science With Production"]

[Text] Organically linking the scientific-technical revolution with the advantages of socialism, made to stand out in our party program as a characteristic of the developed socialist society, is the principal task of the economic strategy for the 1980's which was issued by the 10th party congress. As in the new phase of implementing this strategy it comes down to making intensification comprehensive and creating stable long-term foundations for it, that precisely makes the linking of the advantages of socialism with the accomplishments of the scientific-technical revolution all the more compelling. The whole mental and material potential has to be mobilized for it and has to be aimed, in particular, at reaching higher efficiency through new technologies and new products. To go on and trim production consumption further in the future through technological progress and the upgrading of production is a decisive prerequisite for increasing net production and net profit as a profit for socialism in a way that is indispensable for carrying on the principal task policy in our country. All phases of the reproduction process and its links--starting from science and technology--are altogether crucial for reaching this necessarily higher end result. It underscores the need to accelerate the whole economic cycle and fashion it along the principle of refining.

Implementing this strategic objective under current and future conditions--as the Central Committee pointed out at its 10th session--calls for a close mutual penetration between science and production[1] and requires and makes possible their economic intertwining to an unprecedented degree.

The need for such close linkage comes from the rapid development of the productive forces, further accelerating at the international scale, with which one has to keep in step to reach the necessary level of labor productivity. That need grows further due to the internationally indicated trend toward a scientific penetration of production. In conformity with these objective requirements, the 10th Central Committee session referred to important key technologies marking the direction and rate of scientific-technical progress and, over long-term, the tendencies of productive forces development. Coping with them determines the scientific-technical and economic level of the economy and broadly affects the entire economic and social development going on in the process of the continued shaping of the developed socialist society.

Combines--The Most Effective Form of Linking Science With Production

The results of our socialist planned economy, given much attention also beyond our national borders, indicate that with the combines in industry, construction, transportation and communications we have all it takes for economically linking science with production. "As our turning to intensification worked so well, the 'secret' of our success was, precisely, due to the fact that in the combines themselves significant science and research potentials exist that are directly linked with the economic cycles in those economic units."[2] While previously science and production in part still ran side-by-side, that was overcome by the formation and further consolidation of the combines.

A high economic responsibility has today been assigned to the combines, which have become the spine of the planned economy in our country, functioning in conformity with the principles of democratic centralism. They can meet that responsibility because their position in the economy allows them to cope through their capacities with complex economic projects. "The key question here is the linking of science and technology with production and, above and beyond that, with sales and the economic revenue achieved."[3]

Comprehensively intensifying the reproduction cycle, from research to sales--that is the task the combines have to cope with to produce most efficiently the most high-grade products that are needed in conformity with the state economic demand satisfaction plan, for supplying the population with consumer goods and for export. For that they have grand mental and material potentials. They make it possible for them to shape their reproduction in a complex and farsighted manner in conformity with the high economic performance and efficiency requirements, and this through close cooperation with their cooperation partners in the economy and their partners in the CEMA countries, particularly in the USSR. Longtime experience has shown that the combines are asserting themselves as the most effective form for linking science with production. That implies for basic research in the academies and university affairs largely to be focused, through the research cooperation, at the requirements for the economic and technical-technological development of the combines. Based on basic research results--brought about precisely by way of the commissioned research financed by the combines--the combines can set the conditions for having scientific-technical top achievements rapidly transformed into production and sales-effective products, procedures, and technologies and for making a good economic use of them.

The basic task in resolutely converting the party's economic strategy as a creative application of the Marxist-Leninist reproduction theory, on the solution of which we should concentrate even more in getting set for the 11th party congress, lies in making the combines' reproduction process so efficient and flexible that a high type of production upgrading is ensured by important economic effects. The decisive chain link, it turns out, has been the linking of science and technology with all the factors of the intensively expanded reproduction in the cycle of the combines. Focusing on this chain link attests to the creative application of the Marxist idea that with the development of large-scale industry the production of real wealth increasingly depends "on the general state of science and the progress in technology, or on the application of this science to production."[4]

Marx, as one knows, through his cyclical theory set the elemental scientific basis for intensification. Doing so, he offered general statements on the effectiveness of the social labor used in the various reproduction phases and their connection, which are exceedingly valuable for socialist economic management activity in our time.

What he said about shortening production and circulation periods therefore warrants our full attention today as, after all, under the aspect of the hurried development of the productive forces, the time reduction in the science-production-sales cycle is gaining ever increasing importance. "The main way to trim production periods lies in increasing the labor productivity,"[5] Marx writes and then, extending his idea, at once arrives at the crucial question, the economic efficacy of science and technology by being linked with the production processes. "The newly discovered procedural methods are reducing at relatively low costs most lengthy processes of the past to a minimum."[6]

Engels likewise repeatedly points to the close link between science and production. While in his introduction to Marx' "Wage Labor and Capital," he called the inventions and discoveries, ever more rapidly substituting for one another, the cause for the "increasing productivity of human labor,"[7] he underscores in a different context that the "intellectual element of an invention belongs among the production elements."[8]

New Measures for Linking Science With Production

If the 10th Central Committee session, looking ahead to the 11th party congress and the years ahead, set the task to the effect that "important innovations are needed that can only be produced by basic research ranging into the far distant future,"[9] that then establishes new criteria for linking science with production.

New dimensions are involved of the economic entwining of the combines' important science and research potentials with those of the Academy institutes, the universities, and the colleges and technical schools, as nearly every other scientist and researcher of the Academy of Sciences and of the colleges--as Comrade Guenter Mittag affirmed at the 12th session of the GDR's People's Chamber--works together with combines through economic contracts.[10] A high economic effect of science and technology and their organic linkage with production compels the unity between the development of new products and procedures, or of technology development, to an unprecedented extent. That implies turning their in-house rationalization means construction into the most up-to-date technological centers. New qualitative requirements arise thereby also for the production organization, from most suitably shaping the product and production profiles via ensuring high flexibility all the way to production continuity.

The linking of science with production does not yet close the cycle, however. The combines' responsibility ranges to the selling of the products, to getting paid for the exports transacted. That can only be coped with if targeted measures are taken already in the production preparation process about entering the markets. Hence, the requirements placed on management organization are also going up: Reducing the cycle demands more object- or product-related management; demands from the outset that the personnel in science and technology, production, sales, and customer service are brought together; that affects the use of lead enterprises and the organization of product team work. New demands are also being placed on modern management machineries, from the traditional ADP systems to closed CAD/CAM solutions and information and communications systems altogether.[11]

Growing Performance Requirements Go Hand in Hand With an Improvement in Working and Living Conditions

For all that, not only the objective reproduction factors are the ones that determine the economic effect of science and technology throughout the total reproduction cycle; rather, human activity, the people's training and skills, their experiences, and their targeted initiatives in socialist competition have as much an impact on the outcome as has the level of management activity.

A crucial preprequisite for a closer linkage between science and production, it turns out, is a high degree of flexibility on the part of the working people, i.e. their willingness and capability for a planned change of labor tasks, of jobs, work collectives, the place of work, and the working hour arrangements. Experiences thus far have shown that the product turnover combined with the introduction of new procedures, modern technologies, and progressive scientific labor solutions makes new demands on the working people's political attitude, technical skill and occupational know-how. All the greater is the sense of responsibility with which in good time all must be done to get set for training that becomes necessary, for combining occupational training with adult education and, if necessary, for introducing scientific labor organization measures. It is party policy to connect resolutely every step in the further implementation of the economic strategy toward comprehensive intensification always closely with improving the working people's working and living conditions. The position taken by the SED Central Committee secretariat on the Spremberg SED Kreis Management report confirms: "Decisive for solving all economic tasks is and remains man with his abilities, interests and needs."[12]

This link between science and production, always oriented to the well-being of man, according to plan, and no by any means on behalf of just one enterprise, one combine, finds its stable basis in our socialist planned economy. That expresses the concrete advantages of socialism compared with capitalist society, where noteworthy results in productive forces development go hand in hand with massive unemployment and hopelessness, especially among youth, a hostility to technology among broad public circles, nourished by anxiety about the future, and other ordinary realities of the working people, branded by profit greed. The more successfully we advance on the basis of the functioning system of our socialist planned economy with our stable and dynamic economic development, the more clearly and powerfully will these advantages take shape.

Which Combine Experiences Are Worth Generalizing?

A basic condition for good results lies in managing and planning the science-production-sales cycle, from target-directed basic research via applied research and development all the way down to its transfer into production by way of a uniform economic objective. That makes possible focusing on the economy as the point of departure and the terminal in scientific-technological work and rapidly translating the economic potentials inherent in the key technologies into economic productivity and efficiency growth. The combines achieve top performances when they open up and make effective basic research results through close research cooperation with science institutions of the Academy and of university affairs. The important scientific-technological results of recent years in lignite refining, in microelectronics and its use, in the construction and assignment of industrial robots, in the development of new procedures in vortex layer technology, surface refining, and the manufacture of new pharmaceuticals would have been unthinkable without the close linkage between science and production.

Such remarkable achievements presuppose that the combines with their significant intellectual and material potentials are in the position to take up themselves and economically utilize the accomplishments of the scientific-technical revolution and bring an active influence to bear on speeding up the scientific-technical processes.

It turns out to be necessary, first of all, that the general directors always meet their high personal responsibility to using the accomplishments of the scientific-technical revolution. It means that they will fully adapt their personal management style and the whole management system to it and manage the economic cycle as a whole, with production preparation, implementation, and realization meshing smoothly.

The general director of the Schwarze Pumpe Gas Combine e.g. made the development of the gas pressure gasification technology his own business and made sure through his dedication that this technology was developed rapidly--gauged against international standards. To him that meant mastering the requirement in substance, finding the most efficient economic solution, organizing research cooperation with institutes in the Academy of Sciences and with GDR universities and a Soviet research institute, opening contacts with the principal cooperation partners, and coordinating in good time the achievements expected of him.

If in the chemical plant construction combine top achievements with a high economic impact were brought off at short shrift and quite as the customers had specified, it was because the general director always had found in that a focal point of his work. Even his refinement conception ensures the economic link between science and production. Proceeding from the economic requirements for performance and efficiency development, it contains tasks for the development and use of key technologies, including the complex application of microelectronics, robot technology, and CAD/CAM technology. This involves tasks in basic and applied research, in the development of new technological procedures and products, and in improving the production level.

For effectively linking science with production it is important for the combines to have far-reaching conceptions for developing their porduction profiles, derived from the state of development of techniques and technology in the field concerned and from the market requirements.[13]

Secondly it is necessary that the capability of one's own scientific-technical potential is constantly heightened, with one's research cooperation included, to keep the economic linkage between science and production in line with the high international rate of production upgrading. The use of CAD/CAM technology, modern automated research techniques, greatly helps accelerate development and design and cut down the expenditure of live labor. In the VEB lathe plant, Leipzig, that way the time needed for design dropped from days to hours; the original goal to save 10,000 hours in designing last year was already reached in July.[14]

Great importance in this connection attaches to the construction and expansion of branch-specific basic research--especially in research-intensive combines. As the experiences have taught in such combines as microelectronics, Schwarze Pumpe, chemical plant construction, the pharmaceutical combine Germed, or the Hermsdorf ceramics plants, they have to make their own contribution to basic research to reach a degree of upgrading for the production of their branch that rates as high even in terms of international standards.

The combines' building up their own capacities turns out to be a condition for effective research coordination, oriented to economic points of view, with Academy and university institutions. In the chemical plant construction combine, in the pharmaceutical combine, and in the EAW Combine Berlin, e.g., especially good results of such research cooperation were achieved by means of the following steps:

--The combine's general director, with the R&D director attending, confers regularly with the responsible managers of the principal cooperation partners--e.g. the department chiefs of the Academy and the rectors and deans for natural science research at the universities and colleges--on the basic research tasks assigned;
--the targets and requirements for the basic research results needed are worked out in close concert;
--the economically justified measures of the refinement conception are--via the tasking workbooks and the annual science and technology plan--turned into annual commissioned research;
--clear deals are made on how the tasks assigned are to be coped with, by way of a division of labor, by the contract partners and the combine's own potential;
--personnel is exchanged between the combine and facilities of the contract partners;
--the combine allocates material and financial means to strengthen the contract partner's research base and set up joint laboratories and technical seminars at the university or college concerned; and
--the combine finances the basic research.

Thirdly, one must develop the products and the procedures and technologies needed for their manufacture in unity. Thereby an optimum utilization of scientific-technical data is obtainable by way of production upgrading.

So one ensures a design of new products that is consistently friendly to technology, rationalization, and automation and is shored up by a procedural and technological development borne by modern key technologies, which can then be implemented by largely using an extant equipment base which, mainly through modernization, becomes ever more efficient.

In the VEB dkk Scharfenstein, e.g., the enterprise director from the outset ensured the cooperation between research, design, and technology. The tasks transcending those sectors are coped with by a development collective made up of specialists of the enterprise together with important partners from outside the enterprise, all this on the basis of a tasking workbook. In the Textima Combine also such a method has proven itself and has seen to it--not last through the research cooperation with institutes in the Karl-Marx-Stadt and the Ilmenau technical colleges--that the unity of product and technology development was ensured.

The decisive chain link in bringing out scientific-technical results is the in-house rationalization means construction. It has become the foremost source, in many combines the decisive source, by which to meet equipment requirements. The expectations placed on it will always be fulfilled when, in its scope as well as in its internal structure, it is aimed at the application of modern technologies. In the air conditioning and refrigeration combine, e.g., it did meet that expectation. More than half of the rationalization means constructed there are equipped with microelectronic freely programmable or computer-based controls. This way the premises were set for an effective production of consumer goods on the most modern technological basis, and considerable economic results were achieved in the reconstruction and modernization of enterprise departments.

Fourth, the point is to combine the scientific-technical work closely with the combines' sales activities and with market research to get a rapid economic use out of the science data. The objectives for research on developing new products in such combines as VEB Carl Zeiss JENA, ship building, and TAKRAF are derived from the long-range market requirements, future customers' needs, and the basic tendencies in scientific-technical development.

When development projects begin in research, the sales sector starts preparing the market. That made a close cooperation between those two sectors necessary. That created conditions where products meet the future customer demands and the market gets prepared for selling products in high numbers through applied research, customer counseling, and sales organization. At the same time, this close cooperation is prerequisite to responding more quickly to specific customer preferences and having the combines exercise an active bid policy.

The Growing Weight of the Subjective Factor

For all intents and purposes, it is the subjective factor that controls the results of the economic linkage between science and production. This, as coping with the demands of the new phase of the party's economic strategy altogether, calls for "the communists' combative positions, a political motivation for a high performance contribution and expert information on the part of the working people and their being drawn into solving the tasks from the outset, coupled with highly skilled management activity."[15]

Reaching the top in crucial areas, ensuring a mighty economic growth through applying high-tech, especially the key technologies, and closely linking science with production call for developing creative restlessness, risk readiness, target-directed thinking and committed action, a fighting spirit and creativeness, so that this also has become a major concern of the political-ideological and the organizational work in the party organizations.

It is of course a complicated process in many ways to thrust into scientific-technical virgin territory, explore what is not yet known, make new data most rapidly economically useful, and reap high rewards. We must resolutely leave behind what is obsolete and strive for pioneering achievements in science and technology. All the more purposefully one must create the kind of working climate in all sectors concerned that is receptive to all innovations and induces every associate to adopt high standards for his own performance and self-critically gauge it, time and time again, against the highest standards. That also is a favorable climate for making the performance principle prevail, which is indispensable for achieving the utmost. Adequate information, comradely competition, and consistent performance rating enhance the working people's motivation and are, moreover, of an importance of principle for confident, creative work and an atmosphere that fosters a dedicated commitment.

Drawing the young generation of scientists through their target-directed assignments in the youth research collectives into research affects this process positively in several respects. They are the ones, after all, who have the most excellent qualifications for meeting the new scientific-technical requirements. They have studied the latest at their universities and colleges, are urging the application of it, are approaching new tasks without prejudice, and wish to meet their practical test in a hurry. In the last 5 years, more than 70,000 graduates from technical and natural science departments have started jobs in the economy. Promoting the abilities and dedication of these young workers and, especially, bringing them to full effect through involvement in youth research collectives is a most responsible task for the general directors and enterprise directors. Those have good results to show for who sign accords with youth research collectives, motivate them to cope with important tasks, appoint prominent scientists as custodians for youth research collectives, assign projects to them that they will handle under their own responsibility, see to it that the composition of the youth research collectives is interdisciplinary, and ensure an effective moral and material incentive for performances fulfilled.

The effectiveness of the intellectual potential largely depends on properly concentrating capacities at the correct proportions, organizing an effective assignment structure for the qualitative labor capacity, and connecting with each other stable and flexible forms of cooperative work between science and production. That ranges from a solid cadre requirement planning to skill-related assignments and rational labor organization all the way to motivating and promoting the creative cadre. Economic culture demands the sort of organization where the knowledge and experience available are used fully and a rapid adaptation to a high rate of production upgrading and to the introduction of key technologies is ensured. High cadre flexibility and their willingness to keep learning are wanted more than ever.

For the educational lead, produced well ahead of time, to become fully effective it is necessary that together with furnishing the knowledge appropriate work attitudes also are shaped and reinforced. High demands are made on the working people's work morale, their discipline, integrity, and initiative, on reliability and a fast reaction capability, and on conscientiousness and a willingness to cooperate. Psychological barriers that may at times exist can more effectively be surmounted by providing target-directed and differentiated training for the technicians, specialists, youths and chiefs, and the assembly and operations collectives.

Positive work attitudes significantly depend on there being given the proper attention to a comprehensive involvement of the working people and the improvement of their working and living conditions according to plan. Experience has shown also as essential for the performance willingness, which greatly depends on political motivation and the insight into economic necessity, however, correlated regulations in taking care of workers' needs, commuting, and medical care in the territory, as it conforms to the needs of the working people. It has been found to be most beneficial if together with new technology progressive changes are brought in as to the character, substance and organization of labor, so that a more high-grade work is required and routine operations, monotony, and one-sided burdens are pushed back.

The close linkage of science and production in the combines implies that precisely this side of the unity of eocnomic and social policies receives constant attention and is effectively applied through comprehensive cooperative efforts among research, project planning, assembly, and users' collectives.

New Demands Made on the Conducting of Competition

The effects of the scientific-technical revolution, which come to prevail through a closer economic linkage between science and procution in the combines, affect fundamental aspects in conducting socialist competition, including the innovator movement. The deeper meshing of the phases of the reproduction process changes the criteria and intensity of cooperation and calls for an increasingly more complex manner of conducting the competition. This also has repercussions on the rate at which standards, performance parameters, and norms, basic as they are to rating competition performance, have to be changed. Precisely the innovator movement is what most vividly expresses the linking of science with production in socialist competition. The increasing penetration of production with scientific-technical progress already indicates today that the innovator movement in socialist competition deserves a new qualitative role. The scientific-technical potential of our economy is put to effect by the circa 200,000 highly skilled cadre working in science and technology directly and the creative work of all the working people, notably the 2 million innovators.

Especially through the innovator movement R&D data are effectively adapted to concrete production conditions. These adaptation processes are increasingly becoming the main field of socialist cooperative efforts as between R&D cadre, specialists, master foremen, and engineers. Innovators furthermore have the tasks to introduce innovator solutions into the existing production technology, make the basic assets more efficient through modernization, and introduce scientific labor organization measures.

The closer linking of science with production thus objectively demands in all fields, on all levels, further to strengthen socialist cooperative efforts, the joint efforts of scientists' collectives in the Academies, the universities and technical schools, the people in R&D, the technologists, the production workers, all the way down to the sales collectives in the combines.

INTEGRATION OF COMBINES, RESEARCH INSTITUTES EXAMINED

East Berlin EINHEIT in German Vol 41 No 1, Jan 86 (signed to press 10 Dec 85) pp 21-27

[Article by Prof Dr Wolfgang Biermann, member of the SED Central Committee, general director of the VEB Carl Zeiss JENA Combine: "The Combine's Scientific Potential"]

[Text] In "Das Kapital," Karl Marx says that the productive force of labor is, among others, determined "by the workers' average degree of skill, the developmental level of science and its technological applicability, the social combination of the production process, the scope and effectiveness of the means of production, and by natural circumstances." (Footnote 1) (Karl Marx: "Das Kapital," Vol I, collected works, Vol 23, Dietz Publishing House, Berlin, 1962, p 54) The effectiveness of a combine's science potential stands and falls with the political and technical abilities of the managers to grasp and bring to full effect all these factors involved in the boosting of labor productivity.

"Departmentally" conceived, that could not be done; it calls for a combine strategy that takes into account the dialectics of all the phases in the reproduction process.

The most important and, possibly, also the most complicated task in the struggle for a higher economic effectiveness of science and technology, for a higher labor productivity, in our experience is the effective linkage of the scientific-technical progress with the advantages of the socialist social order. This task, basic, after all, to our party's entire economic strategy, can be mastered only if we as managers are in the position to turn its profound socioeconomic content into the starting point for all strategic considerations and to understand and apply the unity of economic and social policy as a central concern of our party policy.

Target-Oriented Research Organization

A large economic potential is put together in the VEB Carl Zeiss JENA Combine. The most significant potentials in the GDR's precision mechanics and optics industry are brought together in its 22 combine enterprises--two of them research centers, two engineering enterprises for rationalization, and one foreign trade enterprise. Some 23 percent of the work force comes with college or technical school training. Circa 5,000 working people are engaged in R&D directly. Another 400 at Academy and college institutions are working on the combine's research tasks on a contractual basis.

Research is subdivided into:
--explorative research, which aims at uncovering fundamental connections and finding effects and working principles,
--application-oriented basic research, aimed at making effective for the first time and/or combining for the first time new working and labor principles, and
--project-related lead research, preparing new developments and modernizations of products within the framework of product groups.

Our combine has taken care of the growing importance of leads by that in both research centers a technical lead research management was set up. It coordinates the lead projects of the various product groups while it also engages in a product group transcending lead within the chief developmental lines typical of Zeiss. This is the long-term approach to finding and solving tasks.

An ever closer linkage among all components of the upgrading process--from basic research to product development--is an indispensable requirement for reaching top achievements and staying competitive with them on the world market.

At the 10th Central Committee session, Comrade Erich Honecker underscored the extraordinary importance of including the research potential of the Academy of Sciences, universities, colleges, and technical schools in the tasks of the combines. Taking its clues form previous experience, "the Politburo has issued measures for developing economic relations between the industrial combines and the facilities of the Academy of Sciences and of university affairs. All basic conditions will be set up to tackle the tasks of basic research jointly and resolve them through fruitful science cooperation, which will lead us to top achievements in science and technology." (Footnote 2) (Comrade Werner Jarowinsky, "Aus dem Bericht des Politbueros an die 11. Tagung des ZK der SED," Dietz Publishing House, Berlin, 1985, p 48)

The industrial application and economic utilization of their scientific data form a highly essential motivation for the associates in these institutions. We are seeking an effective cooperation that protects all that is specific in our partners. Merely thinking in terms of giving and receiving orders or expectations that are unfulfillable would be as harmful for it as some mutual underestimating. The more intensive research cooperation becomes, the more important is the reseach potential belonging to the combine as, precisely, our own qualifications make for the capability for jointly solving research tasks and make us gain time when taking over results.

The success of this cooperation is based on a business-like approach to solving tasks assigned and on clear, intelligible forms of organization.

Proceeding from our combine's contour trends and relying on the long-term science potential of Academy and university institutions, stable relations have evolved with eight principal partners. With them we take care of circa 90 percent of our entire research cooperation. The largest share in this goes to the Friedrich Schiller University, at some 40 percent.

The cooperation with our principal partners is based on long-term skeleton agreements which set down always for a 5-year period the chief research cooperation fields and arrange for the modalities in this cooperation. The whole thing is carried out through economic contracts on the specific research tasks.

The research cooperation is prepared and accounted for annually, relative to themes, on the basis of mandatory organizational and deadline leads. They range from the preparation of requirements or annual targets by the ones responsible in the combine--as basis for correlating with the cooperation partners--all the way to thematic or year's closing defenses, where the fulfilment of commitments agreed to in the tasking workbooks or annual working plans is accounted for and assessed and the needed rules are set down for continuing the projects or carrying the data over into the combine. That also includes preparing joint correlation proceedings or annual working plans as a basis for the partners' plan elaboration, the correlation of coordinated tasks with their draft plans, the coordination and confirmation of the annual working plans, and the concluding of economic contracts for research tasks agreed upon.

This form of organization assigns equal value to the topics of research cooperation and one's own R&D topics, including them into the controls exercised by and the accounting given to the next higher management. That also makes sure that the trusteeship and the material accomplishments the combine has to allocate are planned and balanced in the sector that has the responsibility for the topics.

The 12 September 1985 Council of Ministers resolution improved the premises for focusing the research potentials of the Academy of Sciences and of university and technical school affairs onto the requirements for the combines' economic and technical-technological development. The combines have the task to help form the basic research targets in the science institutions referred to in such a way that a greater effect will be exercised by them on the future scientific-technical contours of the combines and a fast and effective utilization of data becomes possible. To that end, performance contracts have to be concluded for all research cooperation tasks, and concrete, clearly accountable agreeements have to be made, based on scientific-technical objectives, on the quality of research data. These agreements relate to technical-technological and economic parameters and coefficients of the data in conformity with the purposes for which they are intended, the growth in scientific knowledge, gauged against the advanced international standards of science and technology, the objectives in inventions and the copyright work, and the form of handing data on and their terms of acceptance.

This places a new qualitative demand on the further intensification of the relations and the enhancing of their effectiveness, which can be attained only through substantive work and through guaranteeing high achievements and top results. For that, in particular, one's own strategic scientific-technical work has to be intensified so that on that basis the targets for the lead research can be concretely set down in the partners' science institutions and a fast and economic utilization of the research data is ensured in the combine.

Challenging and Encouraging the Partners' Performance

A realization derived from experiences is that the level of the research cooperation results depends on the capability and commitment of both sides. The material-technical base is of course an extremely important factor there. Concerted efforts, e.g., relative to research laboratories, technical seminars, and equipment have been and are of great mutual benefit. Through setting up joint laboratories one found out how to get into particular techniques, and the data transfer was accelerated. This data transfer acceleration came through target-directed personnel exchange. The achievements it led to were exemplary. Through such direct contacts the scientists experience emphatically how much their scientific-technical achievements are wanted.

Focusing the cooperation with our cooperation partners at high scientific-technical and economic objectives means not only exhausting our own science potential, it also means drawing that of our research partner's into the combine's reproduction process. This must be planned long-term and implemented purposefully. That way alone it is possible to bring about mutual partnership in a comprehensive sense, i.e. to achieve joint conceptual work, the forming of joint research collectives, and the correlating of the science potentials and material-technical opportunities with the solution of the taks for mutual benefit.

Commission-related research on an economic basis opens effective new possibilities because that achieves consistency all the way from basic research to the product and the production technology, makes the end result provide the science institutions with a higher place value, and accomplishes the breakthrough in achieving an economic utilization.

Contractual commitment with financing from the one who gives the order makes possible an accurate influence on what was agreed on and a control over the steps taken toward it which, in case of nonfulfilment may also lead to a cancellation of the funds. That, however, also requires an informed decision on whether an objective ex post facto appears unrealistic or the cooperation partner's "faulty research" led to the nonfulfilment of the agreement. One must always assess as accurately as possible the risk factor of any scientific project and, when it breaks down, not dodge the thing retroactively. Then also, the integration of the commission-related research with the reproduction process calls for a still more responsible handling of accomplishments produced. Much, after all, depends on economic utilization, such as the cooperation partners' getting back their investments.

Dealing responsibly with our partners' science potentials means using them as cautiously as our own while fully protecting their integrity. That already is demanded by the magnitude of what we spend annually for the over 100 topics in committed research. Though we have already committed contractually copious capacities with our cooperation partners, we want to make still more intensive use of the potentials of the Academy of Sciences, the universities, and the colleges and technical schools. The first step toward it is involving prominent scientists in prognostic work so that a suggested cooperation can be vested also in the plans of the science institutions.

A managerial responsibility is to open up and sensibly invest our country's material and intellectual potential in achieving a maximum result through small outlays. The way we cope with that, the way our advances will be toward comprehensive intensification. Ultimately this way we also will help decide what the rank and place of our state will be in the international arena, how weighty the word it speaks among the peoples.

That calls for strategies for which the general director bears special responsibility and which are based on objective criteria in national and international development. That way alone we can make sure that the basic strategic trend resting on economic requirements prevails instead of getting lost in the everyday struggle for plan fulfilment.

The accomplishments of the VEB Carl Zeiss JENA Combine in the last 10 years are unthinkable without the close cooperation with science collectives in the USSR within the scope of socialist economic integration. That holds true especially for the development and production of specialized technological equipment for the microelectronics industry in our two countries.

We are working closely together with science and production facilities in the Soviet Union to supply the economy in our countries, within the framework of the GDR-USSR government agreement on microelectronics, with the most up-to-date specialized technological equipment for the components industry. Through this cooperation we have managed to produce equipment in series which, in the USSR and GDR semiconductor industry, sets the premises for producing and testing highly integrated circuits.

Men's Knowledge, Skills and Abilities Remain Decisive

Our work and cooperation are dedicated to strengthening our state as our most important contribution to securing peace. The further profiling and concentration of our science potential is committed to that goal.

In all high-tech sectors, which increasingly determine our combine's future, we deem it extremely important to structure the work with youth brigades and youth research collectives responsibly and while looking ahead. Frequently, after all, tasks assigned to youth research collectives today will later lead to products that are wanted. In each and every case, however, the question has to be raised and answered conscientiously whether a youth research collective can handle it or not. In our experience youth proves its mettle when taken seriously and finding out the work it does is needed. Quite a lot youth does better and more unconventionally than many an "indispensable" cadre.

The success of those who are working in youth research collectives on developmental assignments today greatly depends on how they from the very start ally themselves with the production collectives that will eventually translate their inventions into material products and highly effective technologies. It is becoming increasingly clear to all of us that only through an ever closer alliance between the working class and the intelligentsia can we cope with all the problems. In the most important and scientifically most demanding fields of our work, particularly in high-tech, changes have already taken place in the structure of the work collectives that we would have regarded as impossible only 10 years ago. Here highly skilled specialists and scientists are working together on three shifts, and each depends on the abilities and experiences of his comrade. In this process, the skintight wrestling with the scientific-technological progress, we see with our own eyes the rapprochement between the working class and the intelligentsia.

The test for this cooperation between workers and researchers is the quality of the transfer of new products and procedures. Whatever gets onto the drawing board must be able to be made well and rationally, too, else the best invention does us no good. That also is, not last, the reason why technological work and the in-house rationalization means construction are so important. To these new conditions we adapted ourselves by setting up our two engineering enterprises for rationalization and the technological sectors in our combine enterprises.

The combine's dynamic development is largely due to microelectronics. By way of the economic structure policy of the GDR and the USSR, microelectronics has become the centerpiece of the long-term joint efforts in high-tech. Especially however, microelectronics or also, e.g. news transmission through light circuits make new demands on men, on all their educational and skill levels.

Training questions in the broadest sense of political and technical training, those of education and training in all the enterprises of the combine, are therefore of a great importance of principle. Preparing ourselves in this regard for the demands of the future calls for
--developing a sufficiently broad number of staff personnel for management functions,
--training highly skilled specialists and socialist research personalities, and
--creating a highly skilled and flexible staff of technicians and a relevant engineering potential.

Being oriented to the future mainly means preparing young workers in good time for managerial functions. An essential source of such a new generation of cadre are young workers who are socially active and are doing good technical work. Development contracts are concluded with them, and they are delegated to industrial institutes, universities and technical schools, and then they get the chance to acquire political qualifications and prove themselves in solving various tasks in different functions. Right now we have a staff of 685 workers. By 1990 we are going to have 800.

Highly skilled specialists and research personalities--this we have experienced more than once--do not develop in one or two years. Here one needs long-term and differentiated procedures. Talents and gifts must be grasped and individually promoted and challenged--and that takes one to two decades.

A cornerstone for our future top cadres is laid in Jena's special Carl Zeiss school in physics. There is a contractual cooperation between that school and the combine through which scientists in our research center assume custodial tasks and jointly work on science problems and through wroking seminars. A high school equivalency then is earned in the end, and important courses of study are contractually agreed to for the VEB Carl Zeiss JENA Combine.

In the vocational school that leads to a high school diploma we have set up special classes for the gifted. One can be quite sure that this is the right way.

In organizing and effectively coping with this educational process, we are learning new things every day. There are some problems in finding the objective selection criteria for apprentices for these promotional classes, in the selection and structure of instruction and teacher training, and in continuing the promotion of the gifted during these studies. Nothing, above all, must be allowed to be haphazard about it.

We also are turning, deliberately, young college cadre showing above-average achievements in the enterprise into science specialists. That amounts to an integration with a most strongly performing science collective and target-directed further political and technical training. We have had fine experiences with creativity training courses in Dessau, cooperating with the ministry for construction industry. There, by means of indentures, methods are conveyed for creatively solving science problems, which methods are then immediately used to solve actual research problems. That form links advanced training with research and is extremely effective. A training team has six to 10 participants, and a specialist in research methodology (e.g. a Distinguished Inventor), a psychologist, and an enterprise specialist are in charge. Six patents and the design for a device to be put out as of 1986 are scientific and economic results of considerable value and came out of the last creativity training course.

But not only our top cadre, be they managers or science specialists, have to be oriented to future requirements. It applies equally to anyone working in our combine now or in the future. In that I include the formation of a solid new generation of technicians who can be assigned flexibly and meet the requirements beyond the year 2000. With more than 2,200 apprentices completing their vocational training annually, that is a highly responsible task. As the training takes 2 to 3 years, we thus always have more than 4,000 apprentices in our seven enterprise schools and engaged in practical work of their trade. Worth mentioning are also the Carl Zeiss engineering school for scientific equipment construction and the Hermann Pistor optometry school from which many of our engineers and all fully trained optometrists graduate. Both training institutions are closely linked with the combine. They are aided by financial and material appropriations--when a new technical laboratory has to be set up, for instance--and by deputizing expert training personnel from the combine. Within the framework of that industrial partnership, these educational institutions are assigned requirements for engineering projects, closing and covering projects, and MMM [Fair of the Masters of Tomorrow] tasks; combine specialists are in charge. The training programs of these technical schools, geared to the combine's requirements, furnish us engineers and optometrists who do not need much time to be broken in so they become fully edfective. Especially the engineering school has adapted itself more and more to the requirements from microelectronics.

Such a high training effort is needed to ensure a production substitution rate of 30 and more percent annually in our combine. Advanced training, be it organized in the labor process or through training facilities, more and more becomes itself a component of labor. That also requires new ideas from management about integrating permanent advanced training in the overall reproduction process.

However, the various education and training measures provide higher efficiency for the whole outfit only if we improve our ability to educate personalities who are willing and able to assume, and apply in their work collectives, political and technical responsibility. The importance of the subjective, human factor keeps growing. A crucial advantage of our social order lies in our ability to exploit it. To do so more and more is what we regard as the most important precondition for further boosting the efficacy of our science potential. In the combine's top achievements as planned our researchers find ambitious proving grounds, to be coped with at the highest quality together with all cooperation partners.

TECHNICAL INSTITUTES SEEN AS ECONOMIC INTEGRATION KEY

East Berlin EINHEIT in German Vol 41 No 1, Jan 86 (signed to press 10 Dec 85) pp 35-39

[Article by Harry Groschupf, GDR deputy minister for University and Technical School Affairs: "Technical Schools--Centers of Cooperation Between Science and Production"]

[Text] The universities and colleges in our country with their extensive research potentials are also greatly challenged to get to new products, procedures, and technologies through their basic research that ranges into the far distant future. They will meet those demands all the sooner, the more they are propelling the research cooperation, aimed at high effectiveness, with the combines and the Academy of Sciences institutions. That is good for intensification. Wholly in that sense, coordination contracts are now being drawn up between the colleges and combines. A central spot in them is given to research cooperation for the sake of rapid transfer and a profitable economic utilization of research results. The coordination contracts provide a long-term and stable foundation for teaching, research, and continuing education cooperation, for delegating young technicians for studies, and for assigning graduates.

The close economic linkage between science and production is a compelling need as today, after all, the advances in all economic sectors and hence, the further gradual elevation of the material and cultural standard of living, depend on the latest science and technology data to get rapidly mobilized for our economic growth. Especially the key technologies in their complexity and mutual dependency call for more cooperation among all science disciplines involved. They require long-term basic research for the sake of breakthroughs in techniques and technology. Combining the R&D potentials of the industrial combines with the potential of the Academy of Sciences and university affairs gains far-reaching importance with respect to it, as emphatically underscored at the 10th and 11th SED Central Committee sessions.

In natural science and technical research, cooperation aimed at new products and technologies, and thus at application and economic utilization, comes in many forms. Contract research, joint research and application teams, and user communities for highly efficient research technology are part of it as much as consultation and counseling centers or joint transfer collectives. Not last, there are the Technika [technical institutes] at universities and colleges which are lending perceptible impulses to the research cooperation. They are, as it were, a combination of research labs, application, measuring, and testing centers, science workshops, and training labs.

Evolved in the process in which the eighth party congress resolutions are being fulfilled, they have the function, in conformity with the "conception on the long-term development of the Technika at the universities and colleges," which the GDR Council of Ministers passed in October 1982, to raise decisively the colleges' contribution to the development of new products, procedures, and technologies, speed up the process of production substitution, and boost the dissemination rate of innovations. To that end it is necessary to match basic and applied research more effectively with each other and link them more closely with design and project planning, with technological and technical procedural development. A higher maturity rate in application and transfer is wanted in the college research results to speed up the application and economic utilization of the results of scientific efforts.

The concepts developed by the university scholars and the experienced scientists and engineers in the combine on the goals, tasks, and priorities of the work in the university Technika followed the basic 10th party congress guidelines on implementing the party's economic strategy including those for the economic and science cooperation with the Soviet Union and the other CEMA countries. They thereby responded to the identifiable national and international developmental tendencies of scientific-technical progress, the future prospects of key technologies, and the growing role of base innovations with respect to economic growth and social progress.

The highest priority was thus granted to setting up Technika in the key technology fields. At the Karl-Marx-Stadt Technical College one was set up for cycle I in microelectronics, which explores microelectronic base technologies. The first results, in the form of integrated circuits for coronary pacemakers and watches were brought to production maturity relatively fast and put into industrial production. That the way taken was correct is indicated by that there one is currently working on exploring new base technologies and developing a third generation pacemaker. Or take the Dresden Technical University which created an efficient research potential for developing microelectronic assembly techniques. In the last few years, up to 600 scientists, associates and students, mathematicians, electronics specialists, physicists, automation technicians, information specialists, designers of special technological equipment, and other specialists were working in an interdisciplinary manner on automated solutions for the assembly of microelectronic components and construction elements. Through the interdisciplinary effects aimed at that technology here a high application maturity of the qualitatively new technological solutions was reached, and many different applications for microelectronics were opened up. The high scientific progress in microelectronics now demands of the scientists resolutely to face those tasks that result from the accelerated development of highly integrated circuits and demand new assembly technologies.

This example illustrates that the development and application of the key technologies also require the further development and modernization of Technika relating to them. That also includes the bio-technikum in the process of being set up at the Martin Luther University, Halle-Wittenberg. It is expected to exercise a great impact on advances in biotechnology which are making fast headway internationally.

What experiences can be derived from the activity thus far of the scientists, engineers, and students at the Technika in the universities and colleges? What inferences and conclusions can be drawn from it for further developing the cooperation between colleges and the combine in research and production?

Theoretically Demanding Basic Research

In many economically and scientifically important college research projects a much more intensive connection of fundamental basic research with applied research and with the development of new products, procedures, and technologies was obtained. Research results going into production and leading to highly innovative products and decisive advances in technology, yielding great economic benefits when applied, had their starting point in basic research in fundamental questions in natural science, techniques, and technology. High-rank technological solutions as can be worked out in modern Technika can over the long run be attained only when the technical-technological R&D is steadily nourished from the inexhaustible source of fundamental research, by the latest results of science development. The 10th and 11th SED Central Committee sessions made much of this role of basic research and underscored that the basic research contractually agreed on between the combines and colleges, set up long-term, and to a large extent implemented jointly, is of decisive importance for economic growth, industrial efficiency, and the fulfilling of foreign economy tasks.

Longtime basic research done by a scientists collective at the Otto von Guericke Technical College in Magdeburg on flow-mechanical and thermodynamic problems formed the basis for technological solutions and technical problems in the vortex layer technology to be implemented industrially at a large scale. Conspicuous savings in investments, the trimming of energy consumption up to 30 percent in energy-intensive processes, a perceptible increase in the material and raw material output and in the quality properties of the products, as well as remarkable import savings, became possible in the chemical industry, the foodstuffs economy, agriculture, and other economic branches. Basic research in solid state physics at the Karl-Marx-Stadt Technical College led to a broad palette of technological application in producing extremely thin or super-hard layers and facilitated considerable savings in material and new work piece combinations in the tool industry.

Speeding Up the Rate of Transfer

Decisive for the economic and social efficacy of research at the universities and colleges is the rate in which new natural science and technical data are obtained, is their transfer into effective technical and technological solutions, their first introduction to industry, and the economic spread of the innovations. A critical point in the basic research-applied R&D-production

chain has always been the time it takes to transfer novel scientific-technical data to industrial use. Quite a number of college research data were technologically not mature enough, which delayed their industrial application. That ultimately facilitated a moral wear and tear of scientific knowledge and cut into the likely economic benefit. Especially there, in and through the work of the Technika, a considerable change has occurred which keeps getting more and more noticeable.

Just take the Cottbus Engineering College where, through a close interdisciplinary cooperation of project planners, technologists, economists, materials scientists, and mathematicians, a new type of wall skeleton construction was developed, an experimental structure was erected in an exceedingly brief time frame, and then, after only a few months, this new type of construction was put up at an industrial scale in downtown Leipzig. The unusually brief transfer periods, compared on the international scale, also became possible because the technological and design solutions developed at the drawing board, in the lab, and in the computer center of the college could be produced in a near-industrial manner at the "Preproduction Technikum" and tested for their functionality. All essential components for the experimental structure and the first industrial use were made in this Technikum and were made available to the construction in practice. While exploiting these positive experiences in seeking a high application maturity for research results and speeding up the transfer to practical construction, the collective of scientists and students at this college at present is working on the development and testing of a tieless construction method for public and industrial structures.

Having the colleges come out with applicable research results applies particularly to the kind of results of scientific research the use of which throughout the economy facilitates and causes significant innovations. Those are mainly new components and component groups, new working materials, substances and preparations that are decisive for implementing key technologies. At the Karl-Marx-Stadt Technical College, e.g., many new sensors have been developed which are of great importance for automation. Martin Luther University has developed Peltier coolers in microelectronic technologies which are crucial for further research, developments, and applications in the light circuit communications field. These new components must be made available for as broad and fast an application as possible, for continued R&D tasks, and for getting set for industrial manufacture. That also is the reason why the Technika in the universities and colleges have the function of effectively supporting the thereby possible innovation processes by workshop or small-series manufacture. Wherever the cooperation of researchers, potential producers, and future users is started efficiently and in good time, a high speed of transfer of new basic research data and a rapid economic utilization of research data are obtained.

The Unity of Teaching, Research, and Practice

The Technika at the universities and colleges are increasingly turning into places of effective cooperation between science and the practical field, into centers in which the proven principles of the unity of theory and practice, and teaching and research, are brought to realization on a high level. Thus, at the Technikum for High-Speed Rollers in the Freiberg Mining Academy, scientists, engineers, staff members, and students at the college and the Ernst Thaelmann heavy machine construction combine Magdeburg and the VEB quality and high-grade steel works combine Brandenburg are developing highly productive rolling technologies and are perfecting the rolling mill techniques. At the "Microelectronics Technikum" of the Karl-Marx-Stadt Technical College, always about half of the ones working there are members of the college and of the microelectronics combine.

Through this cooperation not only the organic connection between basic research and the requirements for product and technology development becomes much more intensive, there also are developing new forms of socialist cooperative efforts in research and in transferring its data into production. The scientists at the colleges, particularly the new generation of scientists, become more knowledgeable about the concrete development requirements of industry, and the specialists of the combines and their science facilities through this cooperation gain access in a rational way to the new international developmental science data, to important technological advances, and to new research techniques.

The Technika also are gaining importance to organizing scientific-productive studies at our colleges, as the students are early in the game drawn into R&D projects that are scientifically demanding and relevant in practice. Thus already while they are still studying they can make contributions to the implementation of the economic strategy and are they being prepared in a manner that relates to practice for their later assignments as R&D engineers in design or technology or as managers of work collectives.

In many Technika students, within the scope of FDJ initiatives, youth projects, or through youth research collectives, made up of students and the new generation of scientists at colleges and young engineers, technicians, and specialists of the combines, are working on and solving important tasks of the scientific-technical progress.

The Technika have an importance of equal rank as centers for further training for the colleges' own new generation of scientists and specialists from the combines, enterprises, and institutions. A growing number of experienced technologists, designers, economists, and enterprise engineers already got skilled advanced training at these Technika to speed up technological progress, elevate the technological production level, and put science more still into effect.

In the stretch on the road behind us in setting up and using the Technika, our universities and colleges have already had much success in linking science with production and reinforcing the relations between combines and colleges. Decisive for the results achieved, which are to be extended further in a target-directed fashion, were the directional resolutions taken by the party and the government to use the advantages of socialism more still for coping with the scientific-technical revolution. This development received its substantive guidance from the conception on the long-term development of natural science, mathematics, and technical basic research, relying on which state commissions and other tasks in the science and technology state plan asssigned challenging tasks to science to help contribute to the implementation of the economic strategy.

A key to success on this road of development has always been the leadership role of the party organizations in the colleges and combines. Joint party activists groups and their meetings, regular conferences among the party secretaries of the industrial and college facilities involved, as much as the conferences "on the spot" with scientists and associates, have led to the mobilization of all capacities, to fruitful socialist cooperative efforts in setting up and making use of the Technika.

In the months and years ahead we must still more effectively place science and education, as a productive force, at the service to comprehensive intensification, to the economy, and to that end still more effective exploit the considerable potentials of the Technika. This way the members of university affairs, getting set for the 11th SED Congress, are going to link science with production in a new qualitative fashion and facilitate a rapid transfer of research data.

INCREASE IN MERCHANT SHIPPING TONNAGE REPORTED

East Berlin PRESSE-INFORMATIONEN in German No 151, 30 Dec 85 pp 2-3

[Article by Dr Heinz Rentner, deputy minister for transportation: "Rising Capability of Maritime Ports"]

[Text] Every 3d ton of export and import cargo of our country passes through the three maritime ports of the GDR: Rostock, Wismar, and Stralsund. Some 55 percent of the unique trade between the GDR and the USSR is accomplished via the maritime route.

This volume demands that the capacity of the ports be constantly increased. In 1975, some 15.5 million tons of cargo were moved through the three ports; by 1980, it was already 19.2 million tons; and by 1985, more than 25 million tons. In the VEB Maritime Port of Rostock, goods moving from and to the USSR account for one-third of the cargo turnover. In the 25 years of its existence, this internationally recognized maritime port has permitted around 60,000 vessels under 67 flags to tie up and discharge their cargo and has accounted for loadings of 265 million tons of all types of cargo.

High Commitment of Collectives

The more than 7,000 workers in the harbors of Rostock, Wismar, and Stralsund have contributed with multiple initiatives toward this capacity increase. For example, 390 collectives, numbering more than 4,500 workers, including 127 youth collectives, participated in the maximum output shifts in honor of the 1985 Day of World Peace. The increases in daily capacity of the seaport of Wismar, from 11,800 to 14,000 tons per day, stand out, as does the exceeding of the norm with respect to potash loadings by the youth collective by 887 tons to a total of 5,081 tons in a 12-hour shift. In so doing, the collective experiences have influenced the total work load. Thus, it proved effective to understate the daily work quotas per shift and to identify the best workers immediately after the shift, to recognize their readiness to act as well as to always publicly announce plan fulfillment results.

It was possible to achieve high performance results in cargo turnover through modernization, reconstruction, and expansion of port facilities through the application of modern technology and equipment. During the period following the 10th Party Congress of the SED, a second overseas port of Rostock was virtually constructed. New cargo complexes for grain, fodder crops, fishmeal, and bulk cement, a transloading facility for urea materials were developed during this time period, for example. This expansion also included a mooring facility for deep-draft vessels alongside the bulk cargo queue. At the same time, workers of these ports rebuilt five original moorings specialized with respect to the turnover of import goods through rationalization and supplementing measures, which created capacities for a total of 15 new export lines. New moorings were developed for metal transport. High-capacity cranes and computer equipment facilitated a thorough mechanization which is required for the anticipated annual turnover of 3.5 million tons of metals, consisting primarily of imports from the USSR.

Innovations also exist in the other two maritime ports. In Wismar, an elongated shore-based loading bridge provides facilities for loading bulk potash into two large-scale vessels. An average of 1,000 tons of fertilizer are moved to vessels via conveyors which are many kilometers in length; or the cargo is moved to three new storage sheds. The core of the large-scale facility is formed by an automatic freight car loading facility. Two robots bring a daily total of 190 to 220 special freight cars to the loader, open them, and close them. The potash is transported via bunkers and subterranean conveyors.

At Stralsund, voluminous reconstruction measures have increased the loading of salt to 300 tons per hour. The new ship-loading facility produced for this purpose by the VEB Combine for Maritime Traffic and Port Economy has helped the Transport Branch Rationalization Facility Construction Enterprise attain completely new quality indicators.

Turnover of Large-Scale Container Traffic Tripled

Tremendous efforts are being undertaken to meet the requirements of container traffic, which is developing dynamically both on a national scale as well as on an international scale. The loading of large-scale containers in the maritime port of Rostock has tripled in the past 5 years. In October 1985, it was possible to activate a portion of a modern container terminal at Rostock. Here, a TAKRAF-Portainer--a special hoisting device for loading and unloading ships, is in operation. This is a new symbol and landmark of socialist expansion along the banks of the Warnow River.

The transport of goods using Ro/Ro [roll on/roll off] vessels has taken on increasing significance particularly along the traditional line from Riga to Rostock. Between these two ports, 1984 saw the realization of more than 41 percent of total container traffic and almost 31 percent of the total Ro/Ro service involving the exchange of goods with the Soviet Union realized. Here, trailers--in other words, flatbed trailers which are loaded with containers or piece goods--are rolled onto the ship and rolled off at their port of destination. This substantially cuts transloading times.

Since 1984, a new form of production management has been used to speed up the dispatch of vessels in the port of Rostock. In order to manage the transport, transloading, and warehousing processes in a better manner, a computer system is used to manage all capacities available for goods and vessel dispatch more precisely. A resulting dispatcher program is constantly controlled by the operations center and brought up-to-date. This port throughput "port balance" involving goods, ships, and inland waterway transport facilities has proven itself in practice.

The port railroad station of the Rostock overseas harbor is one of the largest classification yards in the GDR with its 220 km of track. Its throughput capacity is decisive for the smooth transportation of cargoes. Some 90 percent of the cargo is handled by rail. With the connection of the overseas port to the electrified railroad line between Berlin and Rostock, the possibilities for rapid goods turnover are increased. However, this requires a still closer cooperation between the port and the railroad system.

The seaports are faced with significant tasks in 1986 with a projected capacity increase of 5.6 percent. In first place, this involves the supplemental mobilization of performance readiness on the part of our workers and their cooperation partners. Additional emphasis will be placed on the better utilization and introduction of modern technology and equipment involved in goods turnover. Shorter turnaround time for ships, merchandise and land transport facilities are the desirable goals.

ECONOMY GERMAN DEMOCRATIC REPUBLIC

PROBLEMS ENCOUNTERED IN RAILWAY FREIGHT TRAFFIC MANAGEMENT

West Berlin FS-ANALYSEN in German No 3, 1985 (signed to press Sept 1985) pp 5-84

[Analysis by Rosemarie Schneider, Research Office for All-German Economic and Social Questions: "Railway Freight Traffic--Realization of Objectives after the 10th SED Party Congress"]

Railroad Freight Traffic--Realization of Objectives After the 10th SED Party Congress

Table of Contents

Summary

I. Intensification in Domestic Freight Traffic--The Principal Direction for Intensification in the Transport System of the GDR

1. Intensification in Transportation--Its Necessity for the Economy as a Whole
2. Objective of Intensification of Transportation

II. Priority Area for Intensification--Railroad Freight Traffic

1. Specific Tasks and Unique Features of Railroad Freight Traffic

   a. Electrification of the Railroad
   b. Branch Lines

2. Division of Work Between the Railroad and Vehicular Traffic
3. Division of Work Between the Railroad and Inland Shipping
4. Rate Policy Measures

III. Intensification Measures in Individual Industries

1. Planning Organization
2. Optimization of Transport
3. Works Transport

IV. Overall Estimate and Evaluation of the Results

RAILWAY FREIGHT TRAFFIC--REALIZATION OF OBJECTIVES AFTER THE TENTH SED PARTY CONGRESS

Summary

Domestic freight transport, seen with regard to energy conservation, received particular attention at the beginning of the 1980's. This was due to the GDR economic leadership's intensification program, which desired a more intensive utilization of existing production factors in achieving its economic goals. The resulting objectives for the transport system were twofold: structural measures, and a rigorous restriction of the users' demand for differentiated forms of transport. The most important measure regarding freight carrier structure was the transfer of freight transport from road to rail traffic and a reduction in works transport capacities. As road transport had been by far the more favored of the two until then, the railway system did not possess all that was necessary to take over a large share of transport commitments. Electrification (with a corresponding increase in electrotraction), greater use of branch lines, and container transport could only partly create the necesary conditions for this takeover. Nevertheless, the railway system did indeed improve its performance with the same production factors and without fundamental qualitative changes. The development of road freight transport declined, especially transport carried out by the enterprises' own fleets. The planned alterations in traffic structure were mainly carried out by means of administrative measures, affecting both transport agents and users. Transport agents are being increasingly restricted to tasks involving purely haulage; service apart from this come up against technical, technological and capacity barriers.

A reduction in the amount of transport during the period under investigation (until 1985) was achieved by means of management measures in transport planning, optimization, and the almost total restriction of the enterprises' own capacities. The restriction of demand to a "socially acknowledged degree" is having a detrimental effect on the independence and flexibility--and also increasingly the interests of the enterprises and facilities which use the transport system. Limitations on both capacity and fuel quotas, inadequate technical and technological levels of transfer and warehousing processes, as well as a lack of packaging material, are causing problems which can only be solved in a partial and temporary fashion. Permanent solutions, which are efficient for both the individual sector and the economy as a whole, still have to prove their value. The success of the approximately 22-percent saving in energy in the transport sector must therefore be evaluated in the light of the above shortcomings.

I. Intensification in Domestic Freight Traffic--The Principal Direction for Intensification in the Transport System of the GDR

1. Intensification in Transportation--Its Necessity for the Economy as a Whole

If economic intensification is generally understood to be an increase in productivity resulting from the effective use of the factors of production, intensification in the transportation industry means an increase in productivity with the available factors of production, taking into consideration an optimal economic relationship between the branches of transportation. Intensification, in the communist understanding of the word, is basically required when objective limits are placed on the expansion of the mechanism of productivity.

One set of crucially important considerations for the process of intensification that was to be initiated in the transport system were the economic conditions resulting from the altered energy situation. Equally important were the constantly rising transport requirements of those sectors of the economy using the transport system.

The catalyst for the strategy of intensification in the transport system was the growing cost of raw materials and energy on world markets which started in 1980. The GDR was confronted by increased expenditures for the import of almost all raw materials, but in particular of liquid sources of energy, which led to a rethinking in the transport system of the GDR. As a branch of the economy, transport requires about 15 percent of the total energy used in the GDR, or two-thirds of all the diesel fuel for transportation processes in the transport system and works traffic. (Footnote 1) (Otto Arndt: "The Tasks of the Transport System 1981 to 1985," in: DDR-VERKEHR No 6, 1981, East Berlin, p. 187.) The goal of all the intensification measures introduced in the transport sector of the GDR was to effect a marked reduction in this consumption.

An additional reason for analyzing the performance of all the carriers from an energy-economic perspective was that until 1980 the demand for transportation by the enterprises and institutions using the transport system had shown an unusually sharp increase (see Table 1).

Comparisons between the FRG and the GDR of the development of freight traffic point up this negative development. With 65 tons/person in 1979, the GDR had a clearly higher volume of transportation for all carriers (excluding shipping and air traffic) than the FRG (with 41.5 tons).

The excessive demand can also be seen in the comparison of transportation productivity for the same period, with 5,000 ton/km per person in the GDR and 4,200 ton/km in the FRG. Similar tendencies emerge if economic performance indicators, for example, a comparable gross national product, are used as a basis. In 1979 the situation was less favorable for the GDR, with 5.2 tons, or 397.2 ton/km per M 1,000, compared with the FRG with 3.3 tons, or 333.2 ton/km per DM 1000, both in volume of transportation and transportation productivity. (Footnote 2) (Rainer Hopf: "GDR Freight Traffic Returns to the Rails" DIW WOCHENBERICHT No 8, 1981, West Berlin, p. 84).

Table 1. Development of Freight Traffic Overall in 1960, 1965, 1970, 1975, 1980

Year	Freight Transported 1,000 Tons	1960 = 100	Freight Transport Productivity	1960 = 100
1960	522,148	100	50,637	100
1965	628,460	120.4	78,597	155.2
1970	764,015	146.3	128,008	252.8
1975	935,108	179.1	152,742	301.6
1980	1,111,881	212.9	155,294	306.7

Source: Statistical Yearbook of the GDR, 1984, p. 213

This fact is not unknown to the economic functionaries in the GDR. It has been formulated as follows to justify their transportation strategy: "As studies in the GDR and all comparable countries showed, we are transporting--relative to the entire social product or the number of inhabitants and/or those gainfully employed--both too much and over too great distances, and the necessary reduction of specific economic transport requirements is proceeding at too slow a pace, which is not in accordance with the factors of intensification." (Footnote 3) (Werner Gross, Hermann Wagener: "Transportation in Intensively Expanded Production," in: WISSENSCHAFTLICHE ZEITSCHRIFT DER HOCHSCHULE FUER VERKEHRSWESEN 'FRIEDRICH LIST'," Dresden, No 3, 1983, p 283. See also, "Interview with the Director of the Central Research Institute of GDR Transport, Dr Werner Lindner," in: DDR-VERKEHR No 12, 1984, p. 354)

The unsatisfactory development of productivity in the transport system is determined by the following factors, which at the same time constitute the conditions for intensification of transportation in the GDR:

1. The development of the GDR's economy until now has been characterized by constant quantitative growth, with increasing material intensity. An increasing amount of freight to be hauled and a rise in transport productivity are the consequences, and this is the reason for the continuous rise in the demand of those using the system for transportation services.

2. Growing manufacturing productivity as the result of organizational measures such as cooperation, combination, specialization and concentration, can lead to larger amounts to be carried and to a disproportionate expansion of the need for transportation. Until 1980, using the criterion of "extending the division of labor," cooperative relationships developed without regard for distance, the means of transportation available or that could be expected, their location or the links that existed with the network of the enterprise dispatching or receiving the freight, all in all, without any express consideration of transportation requirements.

   One of the consequences was a rapid increase in estimated productivity, but this ignored considerations of efficiency for the economy as a whole. GDR experts now regard this development critically, since perspectives have changed on the economy of transportation.

"Our premise must be that the growth of production in our economy in past years took place on the basis of a division of labor between the enterprises that was being constantly extended, a division of labor which, under present conditions, most certainly does not reflect the best relationship between outlay and result in every case." (Footnote 4) (Gerhard Wunderlich: "Economically Efficient Development of Freight Transportation and the Tasks for Research in Transport Economy in the GDR," in: "DDR-VERKEHR No 3, 1984, p. 69)

3. For the enterprises and combines of the GDR's economy, meeting production indicators stood and, to some extent, still stands at the center of their economic activity. Demands for efficiency were of secondary importance. How else was it possible for inflated transportation costs to be accepted for years without having undesirable consequences or negative economic effects on the enterprises? Those using the transportation system were not forced, either as a result of administrative measures or for economic reasons, to reduce this part of their manufacturing consumption--expenditures for transportation.

4. Decisions of the kind that lead to structural changes in the GDR's economy also bring about increased need for transportation. Among them are:

   a. Measures for the "conversion of energy resources," i.e. the substitution of brown coal for petroleum.

   The GDR's decision to increase brown coal production compared to 1980 by 50 million tons to 310 million tons in 1985 (Footnote 5) (Horst Wambutt: "New Requirements for Producing and Refining Raw Materials for Energy," in: EINHEIT, No 8, 1985, East Berlin, p. 721) will place additional heavy demands on the GDR's transportation system, the extent of which, including the problems associated with starting open-cast mines (rerouting lines, the construction of new sidings, roads, etc.) cannot yet be estimated. (Footnote 6) (see Gernot Schneider: "Qualitative Growth of the GDR Economy," in: "DEUTSCHLAND ARCHIV, No 4, 1985, p. 381)

   The following example shows the extent of the additional load being placed on the transportation system as a result of resorting increasingly to coal:

   " . . . the poor caloric value of brown coal and its low density make moving it uneconomical, compared with petroleum. For example, to transport an amount of energy of 10^9 kcal in the form of brown coal, which weighs about 500 tons, 10 freight cars are needed. For the comparable amount of energy based on petroleum, about 100 tons, or just 2 freight cars are needed." (Footnote 7) (Ibid.)

   Supplying the economy with brown coal as an energy source is an absolute priority for the GDR's transportation system. But new tasks in transportation and haulage are not the only ones to result from the increased mining of coal, changes in the territorial structure and intervention in the transport networks.

" Mining coal with the aid of extensive open-cast mines will lead to substantial intervention in the regional structure and to its partial reshaping. That applies to all regional partial structures, such as production structure, housing structure, the infrastructure for transportation and the structure of regional resources. This creates procedures and relationships which are interlinked in a very complex way in time and space, requiring carefully planning by the territory and all affected branches and areas." (Footnote 8) (Fritz Kabus: "General Transport Planning in the Cottbus Coal and Energy Bezirk," in: DDR-VERKEHR No 4, 1984, p. 108)

For example, in the Cottbus coal and energy Bezirk--the most important center for the mining, processing and refining of brown coal and the generation of electrical energy in the GDR--the

"start up of the confirmed mining conservation areas just until the year 2000 [will require] the devastation of about 70 km of railroad line and about 250 km of public highway. There are plans for the construction of 75 km of new line and rerouting 125 km of line." (Footnote 9) (Ibid.)

Even with strict observance of the state-imposed requirement that the necessary investment for replacing these routes be kept as low as possible, it will use a part of the amount available for investment without showing any tangible increase in productivity for the GDR's transportation system.

b. The commencement of railroad ferry operation between the Baltic ports of Mukran (Ruegen) and Klaipeda, formerly Memel (USSR), starting in October 1986.

With this decision, which is of strategic importance and which partially frees railroad freight traffic between the GDR and the Soviet Union from transit through Poland, a decisive shift of the flow of freight within the GDR from the previous east-west direction to north-south is being initiated. The investment costs associated with it are considerable. In future, all products destined for transport by rail freight to the Soviet Union will have to cover a greater average distance on the territory of the GDR, because Mukran is located in the extreme north of the GDR. The same holds true for return traffic. It is of particular importance that the ferry ports can only be reached by way of the Ruegendamm, which is already severely overloaded. Daily operation will show whether the prior decision to dispense with the expansion of the Ruegendamm can be justified. The responsible planners are hoping to match the increased load on the rail network in the north-south direction by increased flow due to the electrification of this section. In the long run, laying a third and even a fourth track to improve flow in the north-south direction will most likely prove to be unavoidable.

5. Until the beginning of the 1980's the efforts of the transportation system were welcomed as growth in economic production. In the face of all the principles of economy, growing productivity in transport was accepted,

ignoring the fact that it is part of the users' production consumption and contributes to reducing profits.

"According to rough calculations, the economy of the GDR is spending more than M 14 billion annually just for domestic freight haulage by the branches of transportation and works traffic. That is in the magnitude of expenditures by the producing sectors for consumption of electricity. If one considers that haulage rates, as a basis for profits, do not reflect the true cost of transportation and that expenditures for the transportation infrastructure, which are financed from the national budget, essentially also represent transportation costs, an even higher economic expenditure for freight transport between enterprises can be anticipated (as a rough estimate about M 16 to 17 billion)." (Footnote 10) (Hermann Wagener and Guenther Heinrich: "Freight Transport in the Economy and Ways to Reduce it," in: "DDR-VERKEHR, No 6, 1980, p. 192)

Minister for Transportation Otto Arndt reaches the same results in calculating the expenditure for domestic freight haulage at about 5 percent of the production consumption of the entire economy (M 17 billion) (Footnote 11) (see Otto Arndt: "Tasks for the Transportation System of the GDR from 1981 to 1985," in: DDR-VERKEHR No 6, 1981, p. 185)

6. In order to be able to make a more precise judgment about the growth of productivity in the transportation system, the processes that have taken place in the individual carriers must be analyzed more closely.

As Tables 2 and 3 show, over-the-road freight traffic showed a sharp increase until 1980, both in the volume of traffic and in performance, compared with other carriers, while the share of the railway declined.

The shift in the structure of goods in the direction of expensive, high-quality goods, which are especially suited to transportation by road, the locally inadequate range of services offered by the GDR's railway, from the standpoint of both quantity and quality, and transportation policy objectives were the reasons for the increase in road freight traffic. (Footnote 12) (see Section II)

The following statement underlines the priorities in tranportation policy until 1980:

"The tendency for the railroad's share in the total work of transportation to drop, while haulage continues to increase, agrees with general development trends in socialist countries; it results from the increasing concentration of the heavy flow of goods on efficient main lines, from the reduction in the number of access points to the rail network, from the surrender to road traffic of jobs that were economically impractical for the railroad and from the rapid growth of road transportation in recent years. This trend was deliberately supported by socialist transportation policy in the interests of improving the efficiency of the transportation system." (Footnote 13) (Authors' collective: "Economy of Transportation," Vol 1, East Berlin, 1979, p. 121)

Table 2. Growth of Freight Transportation Volume in the GDR from 1960 to 1980 in Millions of Tons

Type of Traffic	1960	1970	1975	1979	1980	1981	1982	1983	1984
Railroad	237.8	262.9	289.0	302.5	311.6	315.2	322.6	325.6	337.4
Road Freight	270.3	463.6	588.2	730.2	729.8	692.7	607.6	584.2	560.7
Inland Shipping	12.6	13.7	14.6	14.8	16.3	16.6	16.8	17.5	18.7
Maritime Shipping	1.4	8.5	11.2	12.1	12.6	12.5	11.0	11.9	12.8

The merits of this way of operating were still being extolled in 1979, and working according to a plan and proportionality were being stressed in the transportation system.

"Under socialist conditions the entire economy grows according to plan and in proportion. . . . This has substantial effects on the need for transport, limiting it to the economically necessary amount, its planned growth as well as satisfying this need efficiently by means of the method of transportation that is most suitable in each case." (Footnote 14) (Ibid. p 221)

A short time later this deliberate introduction of proportionality and working according to a plan proved to be in need of revision, causing noticeable restructuring in the transportation system.

7. Previous investment policy represents another important condition for the structural changes in the transportation system of the GDR. (Footnote 15) (See Johannes F. Tismer: "Economic Policy Strategy for Intensification in Inland Freight Traffic in the GDR in the 1980's," FS ANALYSE No 5, 1982, p. 18). Analysis of investment activity appears to be particularly important because the capital equipment of the transportation branches is of special importance for the program of intensification. In view of the fact that documented investment includes that for the postal and telecommunications system, Table 4 documents a decline in the transportation system's share in the economy's and/or industry's total investments.

The part that went to equipment, that is to say, the actual provision of the means of transportation, formed the bulk of the investments. The part for construction, renovation or new construction of tracks and track equipment or roads, was limited on average to one-quarter of the total amount. The intention was to achieve a rapid noticeable increase in performance in the transportation system as a whole by concentrating the available funds in vehicles and facilities for freight handling, circuit breakers and telecommunications. The inadequate share of the transportation system in the total amount of investments made as well as the structure of those investments, that is, their distribution across the individual carriers and/or institutions, had a deliterious effect on both the scope and the level of the performance of the transportation system. (Footnote 15) (See Authors' collective, op. cit., Vol 2, p 65 ff) These drawbacks are aggravted under the conditions that are placed on the individual carriers by intensification. Greater demands on the railroad, for example, required greater productive efficiency from the rail network, the rolling stock, warehousing and handling equipment as well as from the marshalling facilities, which were oriented toward the increased demands, and maintenance and repair capacities.

Table 4. Development of Transportation System Investments (including Post and Telecommunications)

Year	Volume of Investment Transportation, Post and Telecommunications Millions of M Comparable Prices (Base 1980)	Percentage Share of Volume of Investment by the Economy	Amount for Construction as a Percentage	Amount for Equipment as a Percentage	Percentage Share of of Volume of Investment by Industry
1960	1.883	10.5	34.9	56.9	22.1
1970	3,174	8.7	18.1	78.3	17.4
1979	4,876	9.0	17.9	77.2	17.3

2. Objective of Intensification of Transportation

The objective of intensification of transportation--as part of the overall strategy for intensification--was set forth at the 10th SED Party Congress. (Footnote 16) (See Directives of the 10th SED Party Congress on the 5-Year Plan for the Development of the Economy of the GDR from 1981 to 1985, East Berlin, 1981, pp 24-25) The tasks were established concretely as follows in the law on the 5-year plan from 1981 to 1985:

"To reduce social costs in the economy, as well as for energy-economic reasons, the specific expenditures for transportation of all branches of the economy must be systematically lowered by optimizing delivery and haulage relations. In order to meet freight haulage figures in domestic transportation from the point of view of energy economy, scientific and technological research must centrate on introducing energy-conserving technologies and comprehensive mechanization.

By consistently shifting road freight haulage to the railroad and expanding transportation of bulk cargoes on inland shipping, the division of labor among the carriers is to be made more efficient. In order to increase the productivity of the railroad between 700 and 750 kms of line must be electrified and more efficient technologies must be introduced, which can make more efficient use of the existing rolling stock and driving units and of the installations . . ." (Footnote 16) (GBl [Legal Gazette] DER DDR, Part 1, 1981, No 35, 9 December 1981, p 83)

Two major complexes of tasks can be read out of this statement, which are intended to make a major contribution towards reducing the demand for energy resources in general, but for liquid energy sources in particular.

First: Structural Changes within the Transportation System of the GDR

This complex of measures contains the new arrangement for dividing work among the branches of transportation based on considerations of energy economy.

The arrangement includes:

Shifting freight transportation from the road to the railroad, that is to say, the railroad and inland shipping will assume a greater share of domestic freight transportation and road haulage will be reduced. Some of the plans to implement this structural step are extensive utilization of the railroad's existing network and technical installations, priority electrification of lines, changing the form of traction used, optimal use of means of transportation, increasing the share of combined transport and the use of existing and/or construction of new branch lines.

Reducing the amount of road freight haulage performed by works traffic. The anticipated structural effect is that public transportation will perform a far larger part of the haulage now assigned to trucks.

The point of departure and energy-economic justification for restructuring the transportation system is the fact that the average consumption of diesel fuel of the carriers per million ton/kms is 45 tons for factory traffic, 37 tons for public vehicular traffic, 13 tons for the railroad and 7 tons for inland shipping. (Footnote 17) (Survey of indicators: "Calculations on the Effectiveness of Measures to Reduce Transportation Costs," Building Academy of the GDR, Institute for Technology and Mechanization--Central Office for Optimization of Transportation in Construction, Berlin, 1983. Cited in: Manfred Moltrecht and Armin Schroer: "A Technical Optimal Evaluation of Production Problems--Transportation--Optimizing with Alternative Carriers," in: DDR-VERKEHR, No 2, 1985, p 45) From the point of view of energy, transport by rail and inland shipping is about three times superior to that by road. The possibility of finding a replacement for the individual carriers under certain conditions is the presupposition for the rearrangement of the division of labor among the individual carriers. One of the primary conditions for replacing road haulage with the railroad and inland shipping is an adequate level of performance by these agents, or the willingness to introduce measures that can bring about a clear improvement in their performance. In this context, the electrification of 750 kms of line by May 1985 can only be a measure designed to create the appropriate conditions for a more extensive transfer of freight, although the largest portion of investment funds for the transportation system were used in the last 5-year plan period for this purpose and, as far as one can tell, will be used for the same purpose in the next 5-year plan period. (Footnote 18) (See "The 1000th Kilometer of Electrified Line by the 10th Party Congress," in: NEUES DEUTSCHLAND, 3 June 1985, p 3)

Second: Reducing the Tranportation Demands of the Enterprises and Institutions Using the Transportation System

This objective is being realized by means of a rigorous program of conservation. The deputy minister for transportation of the GDR describes this avenue of intensification of transportation, keeping in mind the problem of replacement, as follows:

"Likewise our efforts are based on the clear recognition that only conservation will help in the long term, that in the interest of our continued economic development maximum conservation of energy, of oil derivatives in particular, can only be achieved by reducing transportation performance, because the requisite measures for energy substitution and reduction of specific consumption cannot be implemented in a timely fashion and on the broad scale that is needed. This finding is undisputed." (Footnote 19) (Dieter Woestenfeld: "Transportation and Energy," in: DDR-VERKEHR, No 12, 1982, p 401)

In the economic practice of the GDR this means reducing the demand for transportation to the "socially" necessary amount or distributing the availability of transportation on a restricted basis among those entitled to allocations by volume, time and structure. By projecting norms and indicators for transport planning, by the mandatory introduction of optimization in transportation and restriction of factory traffic, those using the transportation system are being deprived of the opportunity of requesting transportation performance at a level that meets their requirements. In this sense, intensification of transportation means reducing the range of available transportation in domestic freight traffic. We will examine the problems that arise for those using the transportation system in greater detail below. (Footnote 20) (See Section IV) Basically, for the period from 1980 to 1984, the end result is that intensification goes along with reduction or is partially equated with it.

The two sets of problems in intensification of transportation can be defined more closely in the following objectives (Footnote 21) (See Otto Arndt: "The Tasks of Transportation from 1981 to 1985," in: DDR-VERKEHR, No 6, 1981, p 187 and H. Scholz: "Performance-Related Development of Production Consumption, Tendencies in its Development and the Tasks Awaiting State Guidance," in: DDR-VERKEHR, No 6, 1981, p 198):

--Reduction of specific expenditures for transportation by about 20 percent, which is the equivalent of 30 billion ton/kms
--Reduction of specific energy consumption by 35 petaJoules. That is the equivalent of 6.5 million tons of unrefined brown coal
--Saving 35 million work hours annually in order to ensure the necessary increase in labor productivity of 3 percent annually
--Reducing specific material consumption by 3 to 4 percent annually, the equivalent of a reduction in production consumption of at least M 250 million each year
--Improving the quality and safety of transportation, handling, construction and maintenance processes and the working and living conditions of those gainfully employed
--Increasing freight transportation performance in domestic traffic to 107 percent, with a further dynamic growth in the volume of industrial goods production
--Shifting 15 million tons of freight from vehicular traffic to the railroad to save 400,000 tons of diesel fuel
--Implementing a growth in tranportation performance with a 25-percent reducion in diesel fuel consumption and 22 percent less heating oil
--Reduction of specific energy consumption:
on the railroad by 28 percent
in maritime shipping by 13 percent
in freight traffic by 16.6 percent and
in inland shipping by 8 percent.

II. Priority Area for Intensification Railroad Freight Traffic

1. Specific Tasks and Unique Features of Railroad Freight Traffic

The rail network of the Deutsche Reichsbahn (DR) on GDR territory is 14,226 kms long, (see Table 5) only about half as long as that of the FRG, but has a higher density, 131 kms/1,000 km^2 compared to 115 kms/1,000 km^2 for the FRG and, compared with other European countries, it can be described as tight-knit. (Footnote 22) (Rainer Hopf: " GDR Freight Traffic Returns to the Rail," in: DIW WOCHENBERICHT, No 8, 1981, p 83) and strategic importance of the branch lines. Since 1965 a total of about 1,400 branch lines have been closed, that is about 25 percent." (Footnote 46) (Erwin Kramer: "Die Entwicklung des Verkehrwesens in der DDR" [The Development of the GDR's Transportation System], East Berlin, 1978, p 171)

By concentrating freight handling at the junction stations for freight car loading, these stations assumed a part of the tasks of the branch lines. In 1979 there were 4,800 branch lines, 3,300 of them main lines and 1,500 secondary lines.

In the last 4 years a total of 280 new branch lines have been put in service, including closed down lines which were reopened and renovated. This gives the DR currently 4,607 branch lines, the longest of which is that at the Leuna works at 300 km. (Footnote 47) (See NEUES DEUTSCHLAND 4 June 1985, p 2)

The branch lines are used heavily in open face brown coal mining as pit branch lines, by chemical enterprises (e.g. the Schwedt Petrochemical Combine), enterprises in the construction industry (cement factories and enterprises in the construction materials industry), the ports of Rostock, Wismar and Magdeburg, and by enterprises in metallurgy, ore mining and agriculture. In the future an increasing number of smaller enterprises producing various types of goods are to use or share the branch line network as part of the shift of transportation to the railroad. There are plans to increase the number of access points to the rail network by renovation of existing points or by building new ones. (Footnote 48) (See Order Concerning the Construction and Operation of Branch Lines of 13 May 1985 in

However, precedence is presently being given to working the existing access points at optimal capacity. In order to open up the opportunity of rail transport to enterprises that do not have a branch line at their disposal, the track and handling capacities of the branch lines of several enterprises in one area are being used jointly. The amount of goods to be transported is increased, and it is possible to make full use of the branch lines' capacity and handling equipment. The use of modern, productive technologies for freight handling and train dispatching makes economic sense as a result. But it must not be overlooked that new construction, renovation and the maintenance of branch lines creates high expenditures for material and personnel.

There are a number of drawbacks for the co-users of branch lines, the many smaller and medium-size enterprises that have a small volume of freight, but are now dependent on rail transport by way of these ancillary lines. (Footnote 49) (In 1982 a total of 62 branch lines were newly put in service, 252 enterprises became co-users; in 1983 77 branch lines started operations, 251 additional enterprises became co-users. See Werner Schmidt, op. cit. p 324) For lack of assigned capacity for road transportation, they have to move goods by rail that are less or not at all suitable for it. The growth of the amount of interrupted transport, increases in turnaround time, growing damage to goods, making workers available for loading and unloading around the clock and higher administration costs are just some of the problems that are creating a burden on the users in the economy.

Table 5. Length of Lines Belonging to the Deutsche Reichsbahn

	Length in Kilometers						
	1960	1970	1980	1981	1982	1983	1984
Railroad lines	16,174	14,658	14,248	14,233	14,231	14,226	14,226
Main lines	7,362	7,365	7,621	7,639	7,638	7,634	7,651
Secondary lines	8,812	7,293	6,627	6,594	6,593	6,592	6,575
Standard gauge	14,866	14,100	13,952	13,935	13,936	13,933	13,941
Electrified	708	1,357	1,695	1,808	1,930	2,096	2,321

Sources: Statistical Yearbook of the GDR 1984, p 212; Statistical Almanac of the GDR 1985, p 85.

A comparison of volume for the year 1983 shows that the DR generates a higher volume of transportation in railroad freight traffic, with 325 million tons of freight, compared with 310 millions tons in the FRG. (Footnote 23) (In 1979 the following figures were achieved: DR 303 million tons of freight, DB [Deutsche Bundesbahn] 371 million tons. Ibid.)

If the respective transportation performances are compared, the same trend emerges. In 1983 the DB achieved 57 billion ton/km, and the DR just under 55 billion ton/km. (Footnote 24) (Statistical Yearbook for the FRG 1984, p 228 [in the case of the numbers for the FRG, those for 1983 are provisional data]) With these figures as well, the comparison with 1979 shows that the development of the railroad's performance in the FRG was retrograde, because at that time 68 billion ton/km were counted, while in the GDR, as the result of the transportation industry's efforts to reduce average transportation distances, the same result was achieved as in 1983. This level of performance by the DR is the more notable, because the railroad of the FRG, including the pertinent communications network, has a higher level of technology available, about 40 percent of the railroad lines are electrified (GDR, 16.3 in 1984) (Footnote 25) (See Table 5) and about 43 percent of all the DB's lines have multiple tracks (Footnote 26) (Statistical Yearbook for the FRG 1984, p 289), while only about 24 percent of the DR's lines have multiple tracks.

The different development of freight carrying performance for the railroads in the two German states is an expression of different transport policies. In addition to the free choice of the means of transport, part of a market economy is the efficient development of individual carriers, which meets the differentiated requirements of the users for transportation. (Footnote 28) (See Ulrich Klimke: "Transport Policy in the Field of Relations between the FRG and the GDR," in: ZEITSCHRIFT FUER VERKEHRSWISSENSCHAFT, No 1/2, Duesseldorf, p 59) A market economy has mechanisms at its disposal that made an "administrative" allocation of carriers superfluous. As in most highly industrialized countries, the change in the structure of goods led to an increase in road freight traffic and a decline in railroad transport in the FRG as well. In 1990, it is estimated that 75 percent of the total volume of freight will be moved by road. (Footnote 29) (See Peter Luensdorf: "Predicted Development of Freight Traffic in the FRG until the year 2000," in:

DIW WOCHENBERICHT No 22, 1982, pp 279-284. See "Wirtschaftlicher Strukturwandel und Verkehr" [Changes in Economic Structure and Transport], Beitraege aus dem Institut fuer Verkehrswissenschaft an der Universitaet Muenster, Vol 89, 1979, p 106) This corresponds to the economic development by which the share of bulk goods declines and that of high-grade products increases. The latter place special demands on transportation, so they are particularly suitable for transport by road.

As part of its intensification program, the GDR can exploit all the specific advantages that are available, without any doubt, to the railroad for its transport policy, but but it will also be forced to accepts the drawbacks of this carrier, or search for opportunities to minimize or eliminate them.

Unique Features of Railroad Transport:

The form of energy used can, in the case of the railroad, be best suited to the particular energy situation of a country. The use of domestic raw brown coal for the production of energy, in the case of switching traction to electrical energy, makes the railroad a "cheap" carrier for the GDR's economy, and one that is independent of imported sources of energy. A primary precondition for this is the use of locomotives having a range of power and performance. The GDR can satisfy this requirement to a small degree at present. The locomotives available for heavy hauling tasks have to be used everywhere, so that the desired conservation is not fully achieved.

Railroad transportation is especially suitable for carrying bulk freight over long distances. Except for coal and products of the construction materials industry, whose share of the total amount carried is currently about 50 percent, the GDR, like all highly developed industrial nations, is showing signs of a structural change in its manufacturing sectors. The share of high-value goods, goods from the chemical industry, the glass-, wood- and plastics-processing industries will tend to grow. With the implementation of the strategy for more refining in production, which is to be increasingly called for during the next 5-year plan, demands on transport quality will increase considerably. On the other hand, more refining will mean a reduction in material intensity, with a consequent reduction in transportation needs. The consequence of the structural change in manufacturing sectors is the production of goods which have varying transportation requirements and, for the most part, have a specific affinity for road transport. It will be difficult, if not impossible, for the railroad, as a carrier, to achieve the quality of transport that comes close to meeting these requirements from the point of view of express transportation and different handling requirements. The mutual dependence and tight interlocking within the industry of the GDR, as well as the relationships between the enterprises that follows the principles of balance projection (i.e. state allocation), viewed over the long term, can turn the absolute commitment to railroad transportation into an obstacle to the development of the entire economy.

The railroad can only exploit its performance potential fully if the flow of transport or freight is concentrated. To achieve this, the freight loads must be composed in such a way that non-stop trains can be made up.(Footnote 30)

(A through train assembled by the consignor or the collecting station, which travels directly, i.e. without being handled in a marshalling yard en route to the recipient or the distributing station. Freight cars moved in full trains are switched 2.2 fewer times at marshalling yards, saving 10 to 15 hours.) Only if full trains are assembled, can the energy-economic advantages of the railroad make their full effects felt. Efforts are currently under way to raise the share of full trains on the DR to 62 percent, in order to relieve the seriously overloaded marshalling yards. (Footnote 31) (See FAHRT FREI, East Berlin, No 4, 1985) But assembling full trains is not without its problems, both for the railroad and for the users in the economy. One requirement is the collection of freight so that full trains can be made up. This requires sidings and/or branch lines, as well as adequate loading and unloading capacity and handling equipment. The latter requires precise agreements on deadlines between the offices involved in the transport. Consideration must also be given to fluctuations in the volume of traffic, that is to say, it must be possible to have some influence on the assembly of the trains from an operational standpoint. (Footnote 32) (See "Handbuch Eisenbahn," East Berlin, 1970, Vol 1, p 505) For hauling bulk freight, such as fuel or construction material, full trains are proving to be a good opportunity for transporting freight more rationally. For other types of freight, however, they mean extending the time of transportation, i.e. limited availability. The increased load on marshalling yard capacity associated with assembling the trains signifies a bottleneck for the GDR, because the DR's sidings have already reached the limit of their capacity, in other words, the system is inadequate for managing the constantly increasing amount of freight. These difficulties are to be overcome by turning freight cars around more rapidly and by minimizing the times a car is switched. In addition, the expansion of the system as well as its reconstruction are urgent necessities.

The specific technological conditions of rail transport (the railroad has its own traffic network, and transport processes can be carried out simultaneously, sequentially or in conjunction with one another) and the economic necessity of making maximum use of the available high capital assets, bring about 24-hour utilization of the railroad's facilities, by the users in the economy as well. (Footnote 33) (In 1984 the inventory of transportation, the postal service and telecommunications made up 13.4 percent of the total inventory of the economy's capital assets. Source: Statistical Almanach of the GDR, 1985 p 32) Freight transport in particular can take place to an unlimited extent during the nighttime hours. This requires continuous loading and unloading of freight trains by the users in the economy. Planning the demand for and the supply of transportation assumes a continuous 7-day utilization of the means of transport. (Footnote 34) (See Part III) In practice this proves to be not unproblematic for the carriers as well as for the enterprises. Setting up a permanent standby duty staff when the enterprise is not operating, increasing the size of the transportation departments, paying bonuses for weekend and night work, using production workers for unloading jobs, these are just a few of the effects of increased rail transport. In addition, due to the railroad's shortage of vehicle capacity of its own, substantial problems result from coordinating with public transportation. This requires constant, almost hourly coordination between the participants and does not allow any change in plan. For the railroad too, the constant state of readiness needed means a considerable overload. The productivity of the enterprises is becoming increasingly dependent on the quality achieved in transportation, in the broadest sense. The railroad must, in the final analysis, meet these growing tasks with the same technical and technological means as before, if one ignores a possible growth in performance as a result of electrification. Continuous "around-the-clock" operation makes necessary repairs and required inspection, maintenance and service of its plant difficult. Within the foreseeable future, the railroad may well reach the limits of its performance.

(a) Electrification of the Railroad

Electrification of the railroad, which has been carried out more intensively since 1980, represents a serious move towards intensification of the transportation system in the GDR. The intente of electrification is to increase performance and achieve the projected energy economic goals. The electrification program is the DR's most important rationalization project in the current 5-year plan and it is the precondition for the planned change from diesel traction to electric traction. The intention is to catch up on what has basically been completed in both western and eastern [European] countries. (Footnote 34) (See Rainer Hopf, op. cit., p 89)

If one looks at the GDR within the community of the CEMA countries, it can be seen that the GDR is still among the "developing nations" with respect to electrification of the railroad. Steps to electrify the railroad began in all socialist states in the early 1960's (see Table 6) and were completed without serious interruptions. They reached a level that is comparable to western countries.

Although it is currently making great efforts in this area, the DR, with 16.3 percent of the total lenght of its railroad lines electrified in 1984, still clearly needs to catch up.

What reasons were there for this "belated reconsideration" of electrification, considering that until 1960 the GDR agreed with the other socialist countries about the advantages of this possible change in traction from what was then largely steam to electric traction. (Footnote 35) (See Werner Gumpel, "Das Verkehrswesen Osteuropas" [The Transportation System of Eastern Europe], Cologne, 1967, p 95) It was not until the early 1960's that the GDR departed from its original strategy of electrifying the railroad network. (Footnote 36) (In 1960 the percentage share of power for trains in 1970 was forecast as follows: steam, 50 percent; diesel, 10 percent; electric operation, 40 percent. The actual ratio was: steam 42.3 percent; diesel, 41.5 percent and 16.2 electric operation. Sources: G. Schilling and G. Tischer, "Energetic" [Energistics] East Berlin, 1960, p 295; Statistical Yearbook of the GDR, 1984, p 215) The clear favoring of diesel traction made electrification superfluous.

The reasons were as follows: with the construction of the Schwedt crude oil processing plant and later on of the Leuna II enterprise, together with the long-term agreement on crude oil shipments from the Soviet Union, the necessary capacity was available to produce the diesel fuel which was needed for the change from steam to diesel. The tendency to give preference to diesel

Table 6. Length of the Rail Lines in CEMA States and Proportion of Electrified Railroad Routes 1979 and 1983

States	Length of the Railroad Network in Kms		Of This Total: Length of The Electrified Railroad Lines in Kms		Of This Total: Proportion of Electrified Railroad Lines in the Total Length of Rail Lines in Percent

2 Including the electrified route network of the GDR's major combines' works lines, with a length of 392 kms

Sources: Statistical Yearbook of the Member Nations of CEMA, published bv the Secretariat of CEMA, Moscow (in Russian), 1979, pp 311-312; 1980, pp 275-276; 1984, p 239 was given additional support by the fact that in the early 1970's the Soviet Union was in a position to supply the GDR with diesel locomotives for heavy freight transportation. In addition, the GDR saw an opportunity to take the strain off its tightly stretched electrical energy balance and to make energy, which at that time was generated almost exclusively in coal-fired power stations, more available to industry. Production of electricity from nuclear power did not play a role until 1970. (Footnote 37) (Besides brown coal, with 82,6 percent, nuclear power had a 10.7 percent share of energy production in the GDR in 1983. See Statistical Yearbook of the GDR 1985, p 56)

An additional compelling reason for the turn away from electrification could be found in the fact that those responsible for it were hoping that they could avoid spending the money needed for investing in electrification and the not inconsiderable maintenance costs.

Investement is needed for the construction of substations (i.e. facilities to convert and distribute electricity to the overhead lines), for long-distance lines, overhead lines and feed lines, including the masts and foundations, also for overhead line commissions, circuit breaker and telecommunications facilities and for the necessary repair capacity in the railroad repair yards (RAW). Because of the desired increase in speed, rebuilding of the way (i.e. the railroad substructure, with the roadbed, ties and rails) is usually necessary.

By concentrating all available investment capital on equipment, this necessary evil was avoided, and an immediate and noticeable increase in performance was achieved without the delay which would have been associated with electrification.

Finally, the decision to go with diesel traction meant that the long-term necessity of electrifying secondary and branch lines could be avoided. Electrification means a restriction on the mobility of the driving unit because it is tied to the overhead network or the conductor rail. The diesel locomotive compensates for this shortcoming, because it can be employed equally on main lines, on secondary lines and on branch lines and is thus more versatile than the electric locomotive, which requires special operating conditions. It must also be taken into consideration that the present decision to electrify only the main lines assumes the use of a different type of traction for secondary and branch lines. The advantages of electric propulsion can only be fully effective on heavily traveled routes.

The decision made in the early 1960's in favor of diesel traction and thereby to neglect electrification was implemented with very few exceptions unti 1 1980. If one looks at the rate of electrification by 5-year plan segments, 349 km were electrified between 1960 and 1965, about 300 km between 1965 and 1970, only 97 km between 1970 and 1975, but 241 km from 1975 to 1980. (Footnote 38) (Statistical Yearbook of the GDR 1981, p 200. See Hansjoerg Buck: "Priorities in Rationalization in the GDR's Transportation System until 1985," DEUTSCHLAND ARCHIV, No 5, 1981, p 496)

The reversal in thinking since the 10th Party Congress and the turn away from principles that had been practiced until then in the GDR's transportation policy once more initiated electrification of the most important means of domestic freight transportation, the railroad, but now with a 20-year delay. As a result, it was now possible to undertake a change in the method of traction (see Table 7). The number of electric locomotives in railroad freight transportation has risen from 20 percent in 1980 to about 32 percent in 1984. The advantages of operating electric trains, greater pulling power and performance, faster acceleration, longer operating life and lower energy consumption when compared with diesel traction, are urgently needed and are being used to meet the increased flow of goods. The fact, too, that the flow capacity of the routes usually increases with electrification can have a positive effect on the performance of the railroad as a transportation agency.

Table 7. Share of Different Types of Traction in Freight and Passenger Traffic on the Railroad 1950-1984 in Percent

Year	Share of the Types of Traction		
	Electric	Diesel Locomotives	Steam
1950	0.7		99.3
1960	4.9	0.7	94.4
1970	16.2	41.5	42.3
1975	16.4	62.5	21.1
1980	19.9	71.8	8.3
1981	22.1	72.3	5.6
1982	25.8	70.2	4.0
1983	28.4	67.9	3.7
1984	32.3	63.7	4.0

Source: Statistical Yearbook of the GDR 1984, p 215; Statistical Yearbook of the GDR 1985, p 88.

The electrification program, which is being carried out in the GDR under the slogan "Ride and Build" as a "youth project," has supplied the through line from the Baltic (Rostock) to the southern industrial areas and as far as the border with the CSSR (Bad Schandau) with "traction current." Without changing locomotives, or any other stops necessitated by operating equipment, and without increasing speed substantially, travel time can be reduced considerably by the use of electric locomotives. Eight of the 14 Bezirk cities in the GDR can be reached on electric trains, so they are linked with one another.

Completion of the planned second major north-south link (besides Rostock to Bad Schandau and Decin in the CSSR) from the industrial area around Magdeburg to Rostock by way of Schwerin will be left for the next 5-year plan 1986-1990, as will the electrification of the cross-link between Rosslau (Elbe) and Wittenberg. (Footnote 39) (See Peter Jochen Winters: "The Target is the 1000th Kilometer," FRANKFURTER ALLGEMEINE ZEITUNG, 3 July 1985 p 10)

Minister for Transportation Otto Arndt described the stage of completion already attained at the 10th SED Central Committe Party Congress in these words: "Electrification of our railroad lines forms the nucleus of an increase in productivity. The speed of implementation of the Politbuero's decrees was raised substantially, so that the target of the directive of the 10th Party Congress was surpassed by about 200 km." (Footnote 40) (Otto Arndt: "Modern Equipment Increases Efficiency in the Transportation System," in: NEUES DEUTSCHLAND, 22-23 June 1985, p 13)

According to its own figures, industry in the GDR is capable by itself of meeting the demand for the electric locomotives that will be required for the change in traction. The VEB Hans Beimler Locomotive Building and Electrical Equipment Combine, Hennigsdorf is providing a 250-series 6-axle locomotive and its successor, the 243-series, for domestic needs. It meets a variety of performance requirements, particularly since there are no plans to increase the average speed of train travel as a result of electrification. The DR has introduced what is referred to as a recommended energy-conserving speed. It is designed to find the optimal relationship between the energy used and the amount of worf performed. It does not exploit the performance capabilities of the locomotives the maximum. The associated changes in travel time (frequently long travel times) are to be compensated for by corresponding driving techniques, i.e. rapid acceleration and extended coastdown. The increased use of microelectronics, i.e. the use of onboard computers, computer-aided central dispatching offices and microcomputers in the signal towers, is supposed to favor energy-conserving driving and, at the same time, make it possible to control vehicle deployment in order to rationalize the management of operations. (Footnote 41) (See Press Information from the Leipzig Spring Fair 1985--"Nachrichtentechnik" [Information Technology] 1985, p 5. Karl-Heinz Burghardt: "Changes in the Organization of Management in the Transportation Industry as the Result of Using Modern Management Techniques," in: DDR-VERKEHR, No 3, 1985, p 82)

Currently the entire transportation system of the GDR has 1,500 microcomputers at its disposal, which are used in dispatching processes for passenger travel, in traffic facilities, vehicles and robot systems. Plans for the next few years are for computer-aided technologies to form the nucleus of intensification processes in all areas of transportation. (Foonote 42) (See Otto Arndt: "The Transportation Policy of the GDR," in: DDR-VERKEHR, No 10, 1984, p 291) The implementation of this goal is proving to be all the more pressing for transportation in the GDR because the previous level of transmitting and processing all the information needed for the movment, warehousing and handling of freight is inadequate. Smooth conmmunications between the point of origin and the destination, between all those involved in moving goods is of fundamental importance for intensification of transportation. The existing information system is particularly inadequate at junctions in the transportation process. (Footnote 43) (Junctions, or intersections--a point in the traffic network at which the lines of one or several branches of transportation cross or join up with each other. They are of special importance for changes in the means of transportation used. See "Lexikon Eisenbahn" [Railroad Dictionary], East Berlin, 1971, p 718)

Transportation and information have always belonged together and still belong together, and to neglect this causal relationship--for whatever reason--means wasting time and material. As a result, even the planned partial solutions will have only a limited success. The use of modern computing equipment is a basic precondition for a new distribution of tasks in the transport sector. Having to rectify what has been neglected means that certain fundamental associations have been ignored or not identified.

(b) Branch Lines (Footnote 44)

(Branch lines: "Nonpublic railroad, or one with limited public access, which is directly connected to the public transportation rail network . . . . Freight cars are moved by way of branch stations between the public transportation rail network and the loading and unloading docks of the one served by the branch line . . . ." "Lexikon Eisenbahn, p 48)

Transport customers have direct access to the DR's public rail system by way of branch lines. Branch lines are part of the DR's transport system, in 1983 they handled 88 percent of the loading and 77 percent of the unloading (Footnote 45) (Werner Schmidt: "Branch Lines--Part of the Unified Socialist Transportation System," in: DDR-VERKEHR, No 11, 1984, p 324) The increased use of existing branch lines and the reopening of those already closed is another important component in transport intensification. Only in this way will it be possible to implement the strategy of a sweeping shift in freight from road to rail and to contribute to reducing the economy's overall expenditures for freight transport. The advantages of branch lines, which have been the subject of renewed intense interest since the early 1980's, is that they make it possible to transport freight directly from the recipient to the sender [sic], that is, immediate handling between rail vehicles and the enterprise's internal means of transportation.

Until the commencement of the new transportation strategy, various criteria for efficiency, for example, an adequately high volume of transport and the workload associated with it, the location and the state of repair of the branch lines, whether they were equipped with adequate freight handling equipment, the labor force requirements and its management, these criteria and the properties of the different types of freight that made them suitable or unsuitable for the railroad were regarded as decisive in the closure, renovation or construction of branch lines. The "railroad wave" brought a new way of looking at things in its wake. Until then, the number of direct access points for the enterprises to the railroad network was reduced drastically, particularly because of the small volume of goods to be moved by this carrier. Small enterprises that did not meet the listed criteria were particularly hard hit. In 1978 this development was characterized as follows:

"The closure of unprofitable branch lines played a major part in the concentration of rail freight traffic. About 80 percent of all freight handled went to branch lines. But on every second one the volume of freight cars was less than 3 per day. Only 13 percent of the total volume was handled at two-thirds of the stations. Freight handling performance was only one criterion for deciding that a line should be closed. Other criteria were the economic and

and strategic importance of the branch lines. Since 1965 a total of about 1,400 branch lines have been closed, that is to say, about 25 percent." (Footnote 46) (Erwin Kramer: "Die Entwicklungssystem des Verkehrswesens in der DDR" [The Development of the GDR's Transportation System], East Berlin, 1978, p 171)

By concentrating freight handling at the junction stations for freight car loading, these stations assumed some of the tasks of the branch lines. In 1979 there were 4,800 branch lines, 3,300 of them main branch lines and 1,500 secondary branch lines.

In the last 4 years a total of 280 new branch lines have been put in service, including closed down lines which were reopened and renovated. This give the DR 4,607 branch lines at the present time, the longest of which is that at the Leuna works, 300 km in length. (Footnote 47) (See NEUES DEUTSCHLAND 4 June 1985, p 2)

The branch lines are used heavily in open-face brown coal mining as pit branch lines, by chemical enterprises (e.g. the Schwedt Petrochemical Combine), enterprises in the construction industry (cement factories and enterprises in the construction materials industry), the ports of Rostock, Wismar and Magdeburg, and by enterprises in metallurgy, ore mining and agriculture. In the future a growing number of smaller enterprises producing various types of goods are to use or share the branch line network, as part of the transfer of transportation to the railroad. There are plans to increase the number of access points to the rail network by renovating existing points or by building new ones. (Footnote 48) (See Order Concerning the Construction and Operation of Branch Lines of 13 May 1982 in SDr.[not further identified] Legal Gazette No 1080 of 31 December 1982, p 57)

However, precedence is presently being given to working the existing access points at optimal capacity. In order to open up the opporunity for rail transport to enterprises that do not have a branch line available, the track and handling capacities of the branch lines of several enterprises in one area are being used jointly. The volume of goods to be transported is increased, and it is possible to make full use of the branch lines' capacity and handling equipment . The use of modern, productive technologies for freight handling and train dispatching makes economic sense as a result. But it must not be overlooked that new construction, renovation and the maintenance of branch lines creates high expenditures for materiel and personnel.

There are a number of drawbacks for the co-users of branch lines, the many smaller and medium-size enterprises that have a small volume of freight, but which are now dependent on rail transport by way of these ancillary lines. (Footnote 49) (In 1982 a total of 62 new branch lines were put in service, 252 enterprises became co-users; in 1983 77 branch started operations, 251 additional enterprises became co-users. See Werner Schmidt, op. cit., p 324) For lack of assigned capacity for road transportation, they have to move goods by rail that are less, or not at all, suitable for it. The growth of the amount of broken transport, increases in turnaround time, more damage to goods, making workers available for loading and unloading around the clock and higher administrative costs are just some of the problems that are creating a burden on the users in the economy.

For the railroad dealing with the growing volume of freight transport by way of branch lines is similarly linked with higher demands. Increasingly freed from service tasks, which it would have to assume more broadly under a system that divides work within the transportation industry, it is restricting itself exclusively to shipping tasks. (Footnote 50) (Service tasks include offering customers complex solutions to problems in transport equipment and organization, for example, a direct house-to-house transport system, keeping to "guaranteed" shipping times, and also informational services as a contribution to improved control of customers' goods movements (vehicle information and preregistration system) These tasks include improved performance in taking freight cars to and fetching them from the branch lines, but also the assembly, movement and dispersal of trains. Considering the fact that at present only 10 percent of the shipping time is spent on the actual transport process and 90 percent on switching cars, marshalling and at a standstill, the ratio will very probably become even worse. (Footnote 51) (WIRTSCHAFTLICHER STRUKTURWANDEL UND VERKEHR, Goettingen, 89, 1979, p 223) The operational tasks of the railroad are growing with the increasing delivery of goods by way of branch lines. It has to guarantee an optimal operating cycle, improve the turnaround time for its freight cars (in 1984 it was 3.86 days), make more efficient use of its trains, guarantee punctual delivery and monitor customers' compliance with the planned transport sphere. (Footnote 52) (For this socalled customer accounts are being set up, which, tallied daily by hand, give the DR a running check on the utilization of the transport sphere by days. It is based on the quarterly report of the customer's transport needs. Conditions still do not exist to permit the use of electronic data processing. See FAHRT FREI, East Berlin, No 10/11, 1984)

These are tasks that are not just associated with the increased use of branch lines, but affect rail transport as a whole. As the number of customers making heavier use of branch lines and placing varied demands on this form of transportation increases, these tasks will grow considerably. Maintaining transport quality, i.e. the guarantee of undamaged freight, punctuality and shipping to the intended destination deserves greater attention. The same holds true for cooperation with vehicular traffic and transportation customers at the liaison offices in the transport chain. By offering improved services, for example, by expanding express freight and mixed freight traffic, the DR intends to make rail transport more attractive to its customers. In order to transport extremely urgent freight more quickly, a freight collection service was established, with about 160 connections. The goods are transported in through trains more quickly between the dispatch, reception and supply centers. (Footnote 53) (See Heinz Krueger: "Services Offered by the DR," in: DDR-VERKEHR, No 11, 1984, p 322)

2. Division of Work Between the Railroad and Vehicular Traffic

The GDR's road system comprises about 120,000 km, about 60 percent of which is made up of municipal roads. In the south the density is above average, in the north fewer roads serve the area. In 1979 road freight transport accounted for approximately 67 percent of the total volume of transportation and 26 percent of total productivity in transportation was accounted for by over-the-road freight traffic. Those were the conditions preceding the intensification of transportation, whose measures are directed particularly at reducing road transport, which is costly in terms of fuel. By the end of 1984 this had been reduced to 58 percent and about 19 percent respectively (see Tables 2 and 3).

If one looks at the amount transported, the major part of road freight transport accrues to factory traffic. As Table 8 shows, it amounted to about 77 percent of total road transportation in 1979. With about 75 percent in 1984, it has not been possible to reduce its share substantially, but the total amount of freight carried by road was reduced during this period by approximately 23 percent.

The sharp increase in freight transport by road until 1979, particularly with vehicles belonging to the enterprises, can be attributed to the following: the transportation policy of the GDR until the beginning of the 1980's assumed that, as far as the division of work between the carriers is concerned, "the increase of the share of vehicular traffic in transportation performance matches a trend which has emerged in the majority of European countries. In the GDR many transportation assignments have been shifted to vehicular traffic in order to relieve the railroad." (Footnote 54) (Authors' collective, "Reproduktion und Verkehr" [Manufacturing and Transportation], East Berlin, 1982, p 159)

Table 8. Growth of Road Freight Traffic in the GDR for the Years 1960, 1970, 1979 and 1980 to 1984

Year	Road Traffic Total in Mill. Tons	Volume Shipped Public Road Traffic		Factory Traffic	
		Mill. Tons	Percent	Mill. Tons	Percent
1960	270.4	131.5	48.6	138.9	51.4
1970	463.6	180.0	38.8	283.6	61.2
1979	730.3	166.6	22.8	563.7	77.2
1980	729.8	166.9	22.9	562.9	77.1
1981	692.7	162.9	23.5	529.8	76.5
1982	607.5	147.5	24.3	460.0	75.7
1983	584.1	141.7	24.3	442.4	75.7
1984	560.7	138.2	24.6	422.5	75.4
		Transport Performance in Bill.Ton/Km			
1960	5.0	2.6	52.0	2.4	48.0
1970	12.2	6.2	50.8	6.0	49.2
1979	21.6	9.7	44.9	11.9	55.1
1980	21.0	9.7	46.2	11.3	53.8
1981	19.9	9.4	47.2	10.5	52.8
1982	16.2	7.6	46.9	8.6	53.1
;983	15.4	7.3	47.4	8.1	52.6
1984	14.5	7.0	48.3	7.5	51.7

Sources: Statistical Yearbook of the GDR 1984, p 213
Statistical Almanach of the GDR 1985, p 86

In 1979 the growth tendency for road traffic was set out as follows: "Absolute growth in transport volume and transport performance with further concentration on opening up new areas, resulting in cooperation with the railroad, shipping and air traffic." (Footnote 55) ("Economy of Transportation, p 123)

This clear favoring of road freight transport accorded with the efforts of users in the economy to exploit the advantages of vehicular traffic. One of its effects is to open up new areas, other advantages are a tighter traffic system, the ability to adapt in the face of structural changes in demand, the possibilities of direct, uninterrupted transportation, autonomous transportation processes, i.e. independently of other carriers or subsystems and in greater flexibility. But the fact that road freight transport is regulated by technological plans less than the railroad, for example, and the ability to adapt to the characteristics of the freight with regard to their transportation needs is there to a greater degree through the use of different vehicles has caused customers to give preference to movement by road. (Footnote 56) (Technological plans--Binding rules for the practical flow of sub-processes in the rail system necessary for carrying out transportation processes. See "Lexikon der Eisenbahn," (p 272)

The structural change by sector, already mentioned, which increased the share of products that are particularly dependent on vehicular transportation because they require a specific method of handling, pushed the division of work between the carriers in the direction of road transport.

The inadequate quality, in the broadest sense, of the performance of the railroad and inland shipping as carriers is closely allied with this shift.

The ready availability of vehicles, which results from the enterprises having their own internal motor pool in order to compensate for breakdowns in materials delivery or in the transportation of their finished product, and the relative independence from planned and assigned tranport capacity from "central office," makes having an independent motor pool as part of factory transport a given for conducting any business in enterprises in centrally administered economic systems.

What cannot be left out of consideration is that the almost unlimited "power of disposal" over the enterprises' transport capacity and the virtual absence of pressure to be efficient caused the enterprises to make generous use of road transportation as a carrier. Encouraged by the formation of the combines from 1978 to 1980, cooperative relationships were set up with no regard for the distances involved. Trucks were used to ship small amounts of material or spare parts over long distances or for private purposes, to name just a few examples.

Even the fact that some of the enterprises' own vehicles were antiquated, consequently extremely prone to breakdown and in constant need of repair and had a high fuel consumption did not result in increased use of the less expensive transport capacity of public vehicular traffic or the railroad.

Intensification of transportation put an end to this development and introduced a new way of looking at the benefits and drawbacks of road freight transport. A reduction in the percentage of long-distance traffic, greater use of public vehicular traffic, handing over the enterprises' vehicles to vehicle combines, the scrapping of worn out but still driveable vehicles, better utilization of tractors and truck trailers, the formation of factory ride-sharing groups, supplemented by a series of administrative regulations, are intended to bring about the change in carrier. The consequence is the need for better organization in the cooperation between the two carriers, railroad and road, within the framework of a joint freight transportation process, because there are expectations of rationalization effects on the economy as a whole from the combination of both partial systems, which is designated a transport chain.

Optimal utilization of the specific advantages of the two carriers, the high route performance of the railroad and the ability of road traffic to serve an area intensively, requires a high level of coordination. What has been inadequate control of processes at the junctions between both carriers is developing increasingly into an obstacle to a broad change in carrier. Experts evaluate the problem as follows:
"The great efforts and abundant exertion within the huge complex of "rationalization of transportation" will have only a limited effect if the questions of interfaces and their "networking" between the individual carriers and the users in the economy are ignored. It is here that the reasons must be sought why only administrative measures have so far succeded in advancing the process of switching carriers." (Footnote 57) (Wolfgang Dehmelt: "Service Enterprises for Railroad Transport and Freight Handling for Industry--A Form of Cooperation in Industrial Transport in the USSR," in: DDR-VERKEHR No 6, 1985, p 186)

In the GDR, according to their own estimates . . .
"material-technical prerequisites in freight handling continue to be affected by a lack of investment, particularly in the transportation-intensive branches of the economy. The current development is characterized by an increasingly adverse age structure for the material. The inventory of equipment more than 10 years old is growing." (Footnote 58) (Karlheinz Beilner: "Economic and Legal Aspects of Coordinating Handling Processes in the Territory," in: DDR-VERKEHR, No 2, 1985, p 34)

Control of handling processes at junctions constitutes the major problem in the collaboration of the two carriers. Neither the users in the economy nor the railroad presently have at their disposal handling technologies and equipment that are adequate to meet the conditions of increasing amounts of "broken" loads, that is, more frequent changes of carrier. If one considers the fact that the cost of freight handling in 1984 constituted 10 percent of the economy's production consumption (5 percent for the public transport system and 95 percent for other areas of the economy), " . . . reducing expenditures for freight handling in conjunction with the rise of 'broken' transport [is becoming] a crucial link in lowering production consumption and raising the quality of the freight transport process." (Footnote 59) (Otto Arndt: "The GDR's Transportation Policy--An Expression of the Growing Importance of Transport as a Factor in Productivity and Growth and of Its Social Function in a Socialist Society," in: DDR-VERKEHR, No 10, 1984, p 293)

There are hopes that partial solutions can be derived from the joint use of handling facilities at the railroad's junction stations, from the creation of loading and unloading teams, from factory driving teams and also from a thorough rationalization of freight handling techniques. (Footnote 60) (See Heinz Schmidt: "The State of Regional Rationalization of Transportation and Trends in Development," DDR-VERKEHR, No 10, 1984, p 296)

The division of work between the carriers is being controlled through state organs both administratively and with economic means. Adherence to the prescribed limits is to be ensured by means of a newly enacted traffic law, normative guidelines for volume, performance and distance of transportation, graduated increases in transport prices and sanctions for non-compliance with the guidelines. (Footnote 61) (See Section III) Special priority is being given to stricter observance of the 50-kilometer distance limit for road traffic. In addition, starting in mid-1985, all goods that are transported by road locally, starting at a distance of 30 km, from one Bezirk to another, are subject to coordination. (Footnote 62) (See "Legal Gazette of the GDR," Part I, No 12, 10 May 1985 (Ordinance on Coordination) Tasks relating to the division of work for factory traffic and public vehicular traffic will also have new regulations. (Footnote 63) (Ibid., paragraph 6, p 143)

The application of administrative methods makes clear that the measures introduced earlier for indirect (economic) guidance have not sufficiently encouraged the formation of sensible transportation chains. As long as shippers do not derive any tangible economic benefits from giving up this type of transportation chain, efforts to find a solution to the problem of how to divide the work will have to be made with the assistance of administrative measures. Besides, it is already clear that as the result of a greater number of interruptions in shipping, given the current level of expertise with these processes, an increase in total expenditures can be expected.

The goal of conserving diesel fuel by means of more extensive exploitation of domestic energy sources has been achieved. But account must also be taken of the fact that this conservation effect was brought about in many cases without any consideration being given to the growth of total expenditures.

Combined Traffic

Combined traffic, in the shape of container transportation, represents a special form of collaboration between the railroad and vehicular transport, because it is particularly suited to carrying out the immediate assignment of intensification of transportation. In active use in the GDR since 1968, the container system is developing under present conditions into a service area with increasing importance for transportation. Particularly advantageous when transporting irregularly shaped goods, it is opening up possibilities for a broad shift in transportation and the rationalization of transportation processes. It has the following advantages: shipping goods by way of one or more carriers without transferring the contents, savings in packing costs, rationalization of internal transportation at the enterprise and of warehousing technology, prevention of freight damage, a reduction in the need for labor during transshipment of the freight and the capability for automation of the transshipment process.

However, transportation chains of this type function only under certain conditions. Besides an adequate number of containers to ensure unhampered circulation and their maximum utilization, they include high-capacity handling facilities, an adequate vehicle pool for both carriers and a suitable network of transshipment sites. The application of modern technologies and handling equipment, the use of process computers for the independent control of transshipment installations and arrangement of shipments are additional important prerequisites for blending the advantages of container transportation with the requirements for intensification of transportation as traffic volume increases.

As can be seen from Table 9, showing the development of container shipping, there was a growing demand by shippers for the opportunities of combined traffic in the period between 1980 and 1984. The number of containers shipped increased by almost one-half. The volume of freight carried increased by the same amount. The result was evaluated officially as follows:

"In the period from 1980 to 1983, as the result of a more intensive use of transport and handling facilities and of the expansion of the container pool, it was possible to achieve the largest increase in performance since the introduction of container traffic in the GDR. With an increase in performance of about 40 percent, which includes the shifting of 1.3 million tons from road freight traffic to transportation by container, a substantial contribution has been made to a more efficient division of work between the carriers from an energy-economic perspective." (Footnote 64) (Otto Arndt: "The Transportation Policy of the GDR," p 291)

Currently the DR has a total of 31 container stations at its disposal, which make direct house-to-house transportation possible, 70 stations are approved for railroad delivery of large containers, among which are 11 transshipment sites where delivery and pickup of containers right to the customer's loading site and back is possible. However, the available capacity of the access points and stations is still inadequate for any marked expansion of container traffic. An increase in the number of access points and expansion of the stations that are approved for container traffic are unavoidable for increasing container transportation.

If one looks at the percentage of container shipments in the total volume of freight and total performance, there has certainly been a steady increase since 1970, but in volume only 0.1 percent was carried in 1970 and 0.5 percent in 1984 (0.3 percent and 1.3 percent of performance). The share of total railroad transport remains within modest limits (see Table 9). From this perspective, the demand of responsible politicians in GDR to expand container transport is understandable. There are, after all, hopes of expanding the possibilities for mechanization and automation of transportation as a result of using containers and thereby increasing productivity and eliminating the heavy physical labor still involved in transportation.

The solution to this problem seems all the more urgent, because three-fifths of the containers' total running time is still needed for transshipment and storage. (Footnote 65) (See round table discussion on the topic "Tasks in Container and Mixed Freight Transportation," in: DDR-VERKEHR, No 5, 1983, p 130)

Table 9. Container Shipments By Rail for 1970, 1975, 1980 and 1981 to 1984

Year	Number of Containers Shipped (1,000)	Volume of Freight Shipped (1,000 tons)	Percentage of Total Volume of Freight Transport	Percentage of Rail Freight Transport Volume	Freight Transport Performance (Millions of Rate ton/km)	Percentage of Total Freight Transport Performance	Percentage of Railroad Transport Performance
1970	185.5	890.3	0.1	0.3	178.7	0.3	0.4
1975	358.3	2,035.5	0.2	0.7	423.4	0.6	0.9
1980	486.5	2,935.2	0.3	0.9	664.1	0.8	1.2
1981	482.1	3,024.2	0.4	1.0	715.1	0.9	1.3
1982	552.5	3,495.6	0.4	1.1	795.2	1.0	1.5
1983	639.9	3,934.5	0.4	1.2	903.0	1.2	1.6
1984	697.7	4,451.1	0.5	1.3	1,046.2	1.3	1.8

Source: Statistical Almanach of the GDR 1985, pp 86, 88

The DR requires almost 30 percent of the capacity at the container handling sites to move the containers from one train to another. (Footnote 66) (Ibid., p 131) If these crucial weak spots in container transportation are not eliminated, limits will be imposed on the further expansion of this transportation system in domestic freight traffic. Similar obstacles are posed by high container downtime, by a failure to make maximum use of their space and weight capacity and unsatisfactory use of the load length of the freight cars. These inadequacies are a result of a lack of prerequisites and poor preparation on the part of both the carriers and the shippers for container transport. Specific conditions are attached to transportation using containers, and their observance determines the efficiency of this transportation system. The most urgent tasks at present, both for the railroad and the enterprises who make up the shippers, are to raise the technical level of the transshipping installations, to improve the technology and to increase the number of containers. The conditions, principles and methods, as well as the sanctions for violations in container transport, are laid out in the Freight Transport Regulations (GTVO) (Footnote 67) (Legal Gazette of the GDR, Part I, No 2, 2 February 1983, fifth implementing regulation)

The use of small containers and pallets is also set out in these regulations. (Footnote 68) (Ibid., sixth implementing regulation) There are hopes that the heavier use of small containers and pallets by the shippers will bring about further rationalization of container transport. The intent is to achieve "annual growth rates of 12 to 15 percent" in the use of all types of containers in domestic freight transport (Footnote 69) (Otto Arndt: "The Transportation Policy of the GDR," p 293)

3. Division of Work Between the Railroad and Inland Shipping

If it was possible to register a positive balance overall, considering the railroad's goals of traffic intensification, the determination with respect to inland shipping is that no final breakthrough has been achieved here.

As can be seen from Table 10, there was an increase in the volume of transport of 2.4 million tons and in performance of 0.4 billion ton/km in 1984 compared with 1980, but no substantial increase in transportation was achieved on the GDR's inland waterways.

Table 10. Performance Growth for Inland Shipping in 1960, 1970 and from 1980 to 1984

Year	Volume of Freight Carried (Million Tons)	1960 = 100	Transportation Performance (Billion ton/km)	1960 = 100
1960	12.6	100.0	2.3	100.0
1970	13.7	108.7	2.4	104.3
1980	16.3	129.4	2.2	95.7
1981	16.6	131.7	2.4	104.3
1982	16.8	133.3	2.3	100.0
1983	17.5	138.8	2.4	104.3
1984	18.7	148.4	2.6	113.0

Source: Statistical Yearbook of the GDR 1984, p 213, Statistical Almanach of the GDR, p 86

A proven means of transportation for bulk freight traffic, inland shipping presently carries bulk freight whose share of its total volume is between 70 percent and 95 percent. The freight includes construction materials, solid fuels, ores, metals, waste products, agricultural products and those of the food and luxury goods industries, but also increasingly machinery and equipment. There are supposed to be areas in which containers can be used, which at the present time are carried in only small numbers on inland waterways.

In 1984 the GDR had 1,675 km of main waterways and 644 km of secondary waterways, 566 km of canals and 1,287 km of regulated and channeled stretches of river, with 466 km which alternate between stretches of river, canal and lakes. (Footnote 70) (See Statistical Yearbook of the GDR 1985, p 85) By comparison with the FRG, whose inland waterways are almost twice as long, 4,429 km, of which 2,989 km are rivers and 1,440 km canals, the GDR is not in a bad position in this respect, with 21 km of inland waterway per 1,000 km^2, compared with 17 km in the FRG. In spite of these favorable conditions, inland shipping has not been used much for freight transportation. While 7.9 percent of the volume of freight carried in 1984 in the FRG and 20.8 percent of shipping performance went to this branch of transportation, the GDR managed only 1.9 percent and 3.4 percent in the same year. (Footnote 71) (See Tables 2 and 3) According to estimates by experts in the GDR "the major portion of the waterways is used less than 50 percent, if night non-operating times are included the use factor drops even further." (Footnote 72) (Astrid Kroeger: "The Role of Inland Shipping in the Carrier System," in: DDR-VERKEHR, No 7, 1984, p 214)

In comparison to other socialist countries--in the CSSR this carrier took 3.2 percent, in Hungary 4.5 percent of total transport performance--the same low utilization of this carrier emerges. (Footnote 73) (Ibid.) Even if imminent energy-economic problems make carrying freight on inland waterways more attractive once again, since this involves the lowest specific expenditure of energy (the ratio of energy expenditure per unit of performance among the three carriers, inland shipping, railroad and vehicular traffic is 1:1.25:4) and there are consequently cost advantages (Footnote 74) (The cost advantages of inland shipping are based on the following: Natural traffic routes (waterways) are used, costs are lower for route construction compared with other carriers; greater capacity of the container; optimal ratio of dead weight to payload; slower speeds result in lower energy consumption per unit of performance), there are a number of objective reasons and obstacles in the way of a broad shift of freight from road and rail to the waterways:

Inland waterway transport is particularly suited to non-express freight.

Moving the freight more quickly, and therefore raising speeds, would have a negative effect on energy requirements, the need for labor and not least on the environmnet (embankments and riverbed reinforcements). Only smaller ships could be made available, and the extent of transportation would be correspondingly reduced.

In order to provide more noticeable relief for road freight transport and the railroad, more goods that are not under any pressure of time, that is, they have the typical characteristics for inland shipping, have to be carried on the waterways. Mechanical engineering products might have some limited suitability. It would have to be taken into consideration whether the costs for their multiple transshipment can be justified from the viewpoint of the entire economy and whether any energy-economic benefit results.

In spite of these limitations, there are possibilities open to inland shipping to make better use of the available operating time. Reducing all types of layover time and controllable downtime and repairs, raising the ships' operating time, the introduction of multiple shift operation and the use of computer-aided systems for fleet control would make it possible to increase the amount of time under way, which at present does not even amount to 25 percent of the total annual work time, and thereby create capacity for the shift of transportation.

If inland shipping takes more goods, it will be necessary to expand the existing points of access to the waterway network.

This applies to factory-owned access points (such as harbors, transshipment sites or loading sites for the construction industry) which are the starting point of ship transportation for the shipper and the end point for the user. Pre- and postruns by the railroad or vehicle traffic are not necessary. These access sites specialize in the appropriate type of freight, as do the handling installations. On the other hand, in order to load goods from the supply area that would be suitable for inland shipping at factory-owned access sites, special installations for transshipment would have to be set up both with the shippers and with inland shipping. In each case the necessary delivery and pickup would increase the extent to which transportation is interrupted. The possibility of joint use of factory-owned transhipment points has either not been put into practice or only to a limited degree.

Table 11. Transshipment of Goods in the Inland Ports of the GDR from 1960 to 1984

		Transshipments (million tons)				
		By Port Authority				
Year	Total	Upper Elbe	Middle Elbe	Oder	East Berlin	Other Ports
1960	13.0	1.8	3.9	3.7	2.4	1.2
1970	15.8	2.3	4.7	4.0	2.4	2.4
1980	17.0	3.4	5.0	4.5	2.4	1.7
1981	17.2	3.5	5.2	4.7	2.1	1.7
1982	16.9	3.6	5.1	4.6	1.8	1.8
1983	18.5	3.8	5.8	4.8	2.2	1.9
1984	20.2	3.9	6.6	5.1	2.7	(1.9)*

* Calculated as a difference

Full utilization of the available transport area is closely linked to the low number of factory-owned access points. As studies, for example, of the catchment area of the Saale have shown, the flow of goods in inland shipping is uneven here, because there are more shipments out. (Footnote 75) (See Uwe Bittenbinder and Reinhard Schroeter: "Regional Studies on the Increased Use of Inland Shipping," in: DDR-VERKEHR No 4, 1985, p 103)

For reasons of energy economy, it is important to reduce the number of trips made with no cargo, that is, to organize return transportation as well. This would be possible through expansion of the access site network.

Access sites to the waterway network also exist through inland ports, which manage the exchange of goods between the carriers and represent junctions in broken transportation. Table 11 shows the extent of transshipment of freight by port installation, with the ports of the Middle Elbe administrations, among which is the largest inland port in the GDR, Magdeburg, carrying the major share (construction material, coal, ores, animal feed and fertilizers and agricultural products).

For shippers, insofar as they do not have factory-run access sites at their disposal and are dependent on the freely available ones, transport by ship is attractive only in the catchment area of the inland ports. If this area is already well served by the railroad, an extra change of carriers means an increase in transportation costs that cannot be justified.

In the catchment area of the Saale, for example, a single public access site in the port of Halle/Trotha and 10 specialized factory transshipment sites face a total of 51 DR freight depots with a multiplicity of main and secondary connectors. (Footnote 76) (See Uwe Bittenbinder and Reinhard Schroeter, op. cit., p 105) The factories' handling facilities specialize in railroad transportation and could not be used for inland shipping in the event of a change in carriers.

Another condition that makes a broad shift in transport to inland shipping more difficult is that the capacity of the existing inland ports, as well as the technical and technological level of the transshipping facilities is inadequate. The cargo handling facilities are antiquated and require urgent modernization and expansion. In the period between 1971 and 1975, this carrier had 0.4 percent of the total volume of investment for transportation at its disposal. There is no reason to believe that the percentage of investment for inland shipping will increase in the next 5-year plan periods and that it could consequently contribute to fundamental changes. A noticeable jump in performance and greater attractiveness for inland shipping would be possible, if the access sites to the waterway network were expanded in number, if bends in canals and rivers were widened, the capacity of locks were increased, the percentage of push tugs were raised and older ships were scrapped. Overall, comprehensive modernization of inland shipping cannot be avoided, if the constantly growing number of tasks is to be managed.

To achieve this, investment capital would have to be made available to improve the propulsion and operating systems and the embankments. The chronic lack of investment funds, which will continue into the forseeable future, will very probably grow into an increasingly formidable barrier to any further improvement in the performance of this carrier.

Another reason for the previous and continuing comparative lack of use of inland waterways can be found in the alignment and state of development of the network.

In a north-south direction the major waterways of the Elbe and the Oder run through only part of the GDR, and their principal transshipment areas, the river estuaries, are likewise outside its territory. Similar conditions obtain in the case of the canal system, which takes an east-west course and is consequently of limited importance. (Footnote 77) (See Bernd Spindler: "See- und Binnenschiffahrt der DDR" [Maritime and Inland Shipping of the GDR], Gesamtdeutsches Institut, Bundesanstalt fuer gesamtdeutsche Aufgaben, Bonn, 1980)

The crucial problem, however, is the location of deposits of raw materials and the existing site structure. The large industrial regions in the south have no access to the waterway network, their manufactured goods are unsuited to transportation by water. Inland shipping also faces an objective barrier in that the seaports of Wismar, Rostock and Stralsund are not linked to the inland waterway network. As a result, a great part of the goods that are suitable for inland shipping is inaccessible, and a shifting of goods can only take place in the area opened up by shipping with the already existing goods structure. Plans for a shift in transportation on a broad scale encounter objective limits as a result.

4. Rate Policy Measures

New rates, which replace those from 1967, have been in force for domestic freight traffic since January 1982. They do not apply to the population at large, craft cooperatives, private artisans and tradesmen, the self-employed and freelancers, as well as agricultural enterprises and installations.

The objective is to bring about the division of work between the carriers that the political leadership is aiming for by means of a differentiated increase in freight rates and a change in the system of setting rates. The intent is to match the price increases in the energy sector with an average increase in rates of 50 to 60 percent, and 80 percent for long-distance road traffic. The increased costs for freight transportation resulting from the application of the rates is intended to force the enterprises among the users to make "economical use" of transportation and to reduction their demand for transport. The official description of this objective is:
"The new domestic traffic rates are intended to lend effective support to the national economic task of reducing specific transportation requirements while implementing the process of reproduction." (Footnote 78) (Joachim Leyendecker: "New Rates for Domestic Freight Traffic in the GDR," in: DDR-VERKEHR No 12, 1981, p 409)

In accordance with the rate changes, shipments over the longest distances carry the highest rates and railroad shipments have lower rates compared with shipment by road. In the same way, shipments by inland waterway carry lower rates than the railroad. (Footnote 79) (See Johannes Tismer: "Economic Policy Strategy for Intensification in Domestic Freight Traffic of the GDR," p 16)

The rates were staggered, the increases amount to:

- --55 percent for railroad shipments by freight car
- --79 percent for freight shipments locally by vehicle, 81 percent for long-distance transport.

This substantial price increase is clearly intended to make the railroad more attractive as a carrier to the enterprises from an economic standpoint.

Container transportation is also being promoted. The 59-percent increase in transportation by rail and the 63-percent increase in road transportation supports this objective.

Freight transportation on inland shipping show the smallest increase. Prices for shipment on this carrier increased only 47 percent, representing an economic spur for shippers.

The example of shipments of brown coal briquets by rail illustrates both the basic traits of price setting and the scope of the changes in price (see Table 12). In it the previously applicable rate scales of the German Railroad Freight Rates (DEGT) are compared to the new rates for freight car loads (TWE).

Table 12. Comparison of the DEGT Price Level (as of 31 December 1981) and of the TWE

Type of Goods/Class of Goods: Brown Coal Briquets DEGT: 4 M
TWE: 4 A
Weight: 26.5 tons
Vehicle: 2-axle freight car

	Freight in M		Freight Difference	
Distance (km)	DEGT (previous)	TEW (new)	M	Percent
50	146.30	152.00	5.70	3.9
100	212.50	303.00	90.50	42.6
200	345.00	607.00	262.00	75.9
400	610.00	1,212.00	602.00	98.7
600	875.00	1,818.00	943.00	107.8
Weight: 53.0 liters Vehicle: 4-axle freight car				
50	292.50	292.00	0.50	0.2
100	425.00	583.00	158.00	37.2
200	690.00	1,166.00	476.00	69.0
400	1,220.00	2,332.00	1,112.00	91.1
600	1,750.00	3,493.00	1,743.00	99.6

III. Intensification Measures in Individual Industries

1. Planning Organization

An important measure in the move for intensification is the reduction of demand among the enterprises that ship their products for transportation. The cutback in demand is to apply to all carriers, but to road traffic in particular, in order to accomplish the desired shift of shipments from road to rail.

Because the enterprises did not limit their demand, a series of administrative measures was introduced, starting in 1980, to accomplish this objective, which affected the economy as a whole. By means of state control, and with the help of constantly tightening regulations and the appropriate ordinances to enforce them, the enterprises were induced to reduce their transportation requirements considerably. Most of the officially calculated conservation figures for transportation were arrived at in this way. The basis for determining demand is the "socially acknowledged need for transportation," i.e., the enterprises' demand for transportation from the individual carriers is reduced to the level approved by the state. That means a further incisive restriction of the enterprises' independence, because the interests of individual industries are given less and less consideration and they have to subordinate themselves to the objective of the economy as a whole. The absolute limitation of demand for transportation further restricts the flexibility of the enterprises, reduces their ability to react, limits the opportunities to use their own vehicles as they see fit and makes them dependent on public carriers.

Transportation planning is at the core of the restrictions. The biggest savings in the GDR's transportation system are supposed to have been achieved as a result of organizational planning measures. Official figures show a reduction of transportation in domestic freight traffic of 4.5 billion ton/km just in the period between 1980 and 1983 as a result of the newly enacted transport planning and method of calculation. (Footnote 80) (See Gerhard Baer, Dieter Hahn, Veronika Meier and Joachim Piehl: "The Situation and Results in the Application of Transportation Indicators and Norms, with Basic Directions for the Further Development of Transport Planning," in: DDR-VERKEHR, No 1, 1985, p 5)

A priority in the regulations that have been introduced is the application of transportation norms and indicators, which form the basis for planning transportation needs. The Regulations on Transport Balance Projection (TBAO) stipulate that the enterprises have binding limits imposed on them in the form of transportation indicators in order to utilize the services of branches of public transportation in order to prepare their transport plans. (Footnotes 81 and 82) (Regulation concerning the determination of transportation requirements and their balancing, Legal Gazette, I, 1982, No 7, p 154) (Planning regulations from 1986 to 1990, starting in 1986, foresees the establishment of an independent planning section for transportation as part of the operational plan, as well as the preparation of transport balance projections for the territories, for each Bezirk, and for the GDR. The TBAO will be dropped when the planning regulations become effective. See the regulation on the organiztion of planning the economy of the GDR from 1986 to 1990 of 7 December 1984, Part D, Legal Gazette of the GDR, reprint No 1190 d.)

See Authors' Collective; "Planungsordnung 1986 bis 1990" [Planning Organization 1986 to 1990], Series: Blickpunkt Wirtschaft, East Berlin, 1985, pp 76-80)

The transportation indicators "for the utilization of freight transport services" also contain specific objectives to reduce the economy's expenditures for transport and to optimize the connections between transportation and supply "and estimates for shifting long-distance shipments from road freight traffic to the railroad or inland shipping." (Footnote 83) (Regulation concerning the determination of transportation requirements, loc. cit., paragraph 4, p 156)

These regulations are new to the extent that until now the enterprises only drew up a capacity balance projection for factory traffic annually, and transport indicators were established only for selected types of goods for the public carriers railroad and inland shipping when they drew up their transport plan. The shippers' transportation requirements were largely met, i.e. the carriers had an unlimited obligation toward their customers.

Since 1984 new rules have also applied to the monthly report to the Central State Administration for Statistics concerning compliance with the indicators handed down. In this way the state maintains a running check on the transportation utilized, the amount and the costs. (Footnote 84) (Central State Administration for Statistics: "Guideline for Calculating Transport Indicators for Shippers," valid starting in 1984.)

Violations of the indicators which cannot be justified from the standpoint of the economy have drawn sanctions since 1984. (Footnote 85) (Order (AO) of 14 December 1983 concerning further economic measures to reduction transportation in the economy. Legal Gazette I, No 34, p 336; AO of 14 February 1984, Legal Gazette I, No 5, p 71)

Legal regulation of planning transport costs for the utilization of public freight traffic and for making shipments in factory traffic has also been in force since 1984. It obligates the enterprises to authenticate their transport costs according to a value figure. Transport costs are planned per M 1,000 of goods produced, both for utilizing public transportation as well as factory traffic. Planning factory traffic costs has to include all the costs accruing for carrying this out with the factory's own vehicles, and that includes intraplant traffic. (Footnote 86) (AO No 4 of 31 March 1983 on the supplement to the order for planning the economy of the GDR from 1981 to 1985, Legal Gazette SDr [not further identified] 1122 XV, p 67, para 4; AO No 4 of 31 March 1983 on the overall guideline for planning in combines in industry and contruction, Legal Gazette, SDr. 1122, p 88, para. 8.2)

The drawing up of transportation norms has been mandatory for transport-intensive branches of the economy since 1983 and, since the beginning of 1984, for all enterprises that have to participate in transport planning. (Footnote 84) (AO of 1 April 1983 on the use of norms to improve planning, accounting and control of transportation expenditures in the national economy--Transportation Norm Order (TNAO), Legal Gazette, I, No 10, p 122) Enterprises and combines using the transport industry that demonstate an annual transportation requirement above a volume of 1,000 tons have to draft proposals for transport norms. In the case of works traffic, the cutoff for having to draw up norms is enterprises with a factory vehicle pool having a payload above 10 tons (applies to vehicles above 4 tons).

They have to determine the transport norms as a ratio between performance, volume and costs at a base figure (usually production of goods).

In connection with the drafting of transportation norms, the shipping enterprises and combines are obligated to prepare their transportation needs with particular attention to planned or anticipated changes (for example, changes in the amount of cooperative effort, the average shipping distance, possible shifts in transportation and in the mandated conservation figures) (Footnote 86) (In addition to the ministries for the trades industries, the Bezirk and Kreis councils and the combines and enterprises under their jurisdiction are also obligated to draft norms, as well as the Ministries for the Construction Industry, Transportation, Agriculture, Forestry and Foodstuffs, and Trade)

The proposals from the enterprises are compared with the possibilities for their realization by the organ in charge of balancing and communicated to the enterprises in the form of indicators as a "balanced claim for the provision of services" so that they can draft their transportation plans. This means that discrepancies can arise between the enterprise's overall transportation performance requirements and its need by carrier, as well as the possibility of meeting these requirements. This form of "compulsory allocation" has to achieve results in conservation, because only as much is allocated as is considered urgently necessary by the particular balancing organ from the perspective of the national economy.

This compulsory method of operation in transportation, implemented by means of a variety of different administrative regulations, not only damages the economy's ability to adjust. It makes the economy even more sensitive and subject to breakdowns in different ways, because as a result of the absolute leveling, in terms of capacity and structure, of the figures for volume and use of goods transport, the creation of reserve capacity, or a shift to other carriers, is almost impossible.

Apart from this more acute overall problem, there are a number of individual problems for the enterprises using the shipping industry. A more detailed description of them follows at this juncture:

--A prerequisite for determining transportation needs is the analysis of previous utilization of transport performance using individual indicators, but also by time periods and from the perspective of the receiver and the shipper. Due to the lack of a suitable computing base, this analytical activity has been carried out manually for the most part. It is, consequently, time-consuming, inaccurate and does not meet requirements in many respects. The same difficulties arise with the officially mandated accounting.

--The enterprises have to draft the planning documents for transportation at a time in the plan year when there has often been no final clarification of the production program, the percentage of exports in total production, the allocated balance amounts for materials and premanufactured products, the suppliers or even the buyers. The quality of transport planning depends on just such information. The more inaccurate the input data, the less reliable the result--the transport plan--will be. The difficulties become even greater in drafting the 5-year plans for transportation.

--The constant requirements associated with planning to reduce transportation costs will very probably turn out to be a growing problem. The reserves that can be tapped relatively easily are largely exhausted, considering the extent of the previous reduction. At the very latest from that point on, the question arises whether absolute conservation forecasts can be justified, either for individual industries or the economy as a whole, and when the limits have been reached.

--The increased practice of allocating shipments by rail, as well as the continuous reduction of amounts of fuel, usually occur independently of the specific transportation requirements of the individual goods. Paramount is the strategy to bring about a shift, which is to be implemented and for which an account must be prepared, without adequate consideration of the resulting problems, i.e. critically examining costs and results.

--Difficulties also arise for the enterprises in determining a suitable reference figure for transportation performance, volume and costs. If they limit themselves to natural figures, to some extent the result is an inadequate reference to production planning. On the other hand, natural figures can represent different financial values and differentiated transportation requirements. But what is required is comparability within a single combine or branch of industry. The solutions implemented are, as a result, often inadequate.

--Changes in plans, overfulfilment or underfulfilment of production and sales plans, changes in balance shares, changing the suppliers and buyers, etc., affect transport planning if they mean additional need for transportation or the return of unused capacity in the current plan year.

The plan has "legal force" for the combine, and any change starts a chain reaction, particularly as the individual partial plans are, or are supposed to be, balanced with each other.

--Cooperation in operations with the carriers, particularly with the railroad, places increasing demands on the quality of transportation planning. On the basis of transport contracts between customers and enterprises within the framework of assigned plan numbers, the dispatchers, for example, are obliged to report their requirements monthly. Confirmation comes in the form of the transport plan decision, at the latest 3 days before the beginning of the plan month. The enterprises have to place an order for freight cars at the latest 2 days before the day they are needed, as part of the binding plan decision. The assumption is that there will be consistent full capacity over 7 days, which means that Saturdays and Sundays have to be included. Operational transport planning for each month, including plan supervision and monthly accounting of transport indicators, have to be reconciled with the planning of production and its realization.

2. Optimization of Transport

A noticeable reduction in transportation needs on the part of industrial shippers is to be achieved by applying transport optimization. It includes:

--optimization of locations, principally for installations which send or receive bulk cargoes
--optimization of delivery arrangements on the basis of existing locations
--optimal distribution of transport assignments under existing supply arrangements and the branches of transportation suited to them (determination of optimal division of labor within the transport system) and
--determination of optimal operating procedures and technologies within and between the individual branches of transportation. (Footnote 86) (Klaus Juergen Richter: "Methoden der Transportoptimierung," East Berlin, 1984 p 10)

Optimization, employed as early as the 1960's in improving the efficiency of bulk freight shipments in the transportation system, was only "rediscovered" in connection with the task of traffic intensification. The absence of compelling economic reasons for its use, but also the lack of " . . . the type of computing facilities and information base which are adequate for the magnitude of the tasks to be accomplished, in all transport-intensive branches of the economy . . . " resulted in the neglect of transport optimization. "The computing technology base has since been devloped by using equipment from the ESER system. It can be expected that the informational requirements for optizing supply arrangements will now improve." (Footnote 87) (Ibid., p 9)

Attention is currently focused on optimizing supply arrangements (i.e. shipments between factories), because transportation costs can be reduced over the relatively short term and without additional investment capital. The following estimate reveals the expectations attached to it: "Optimization calculations showed that transport costs can be reduced by 3 to 5 percent if this method is applied consistently." (Footnote 88) (Ibid., p 8)

In the opinion of the transportation minister of the GDR, the results achieved so far in reducing transport costs have resulted primarily from these measures. He commented: "These significant results can be attributed primarily to optimization of deliveries and shipments. As a result, in the years from 1981 to 1984, a total of 8.4 billion ton/km in freight transportation was not needed." (Footnote 89) (Exclusive interview with Minister Otto Arndt: "Tasks for the Transportation System in the 1985 Plan Year," in: DDR-VERKEHR, No 1, 1985, p 2)

First practiced in the five most transport-intensive branches of the economy, coal and energy, ore mining, metallurgy and potash, construction, the chemical industry and agriculture, forestry and foodstuffs--which account for three-quarters of the shipping volume and performance of the branches of public transportation--efforts will be made increasingly to optimize supply arrangements in firms in other areas of the economy. The metal-processing industry can be taken as an example. Particularly in the 1960's and 1970's, its product and production structure was associated with a disproportionate development of the scope and of the value of cooperation performance and consequently of transportation relations.

The scope and structure of transport processes can be seen from the example of the October 7th Combine in Berlin. This combine consists of 13 enterprises, with over 40 plant sections and manufacturing areas, which belong to the Bezirks of Berlin, Leipzig, Karl-Marx-Stadt, Dresden, Gera, Magdeburg, Potsdam and Halle. Annually they produce about 3,000 machine tools, made up of approximately 130,000 to 160,000 individual parts, with a weight of up to 20 tons per part. About one-half of all the individual parts are manufactured in plants outside the combine. To the already extensive transport performance between the plants in the combine, there is consequently added, to an even greater extent, that which results from its supplier relationships to plants outside the combine. (Footnote 90) (See Guenther Tessmann and Heinz Zerressen: "Tasks in the Complex Rationalization of Production and Transport in Industry," in: DDR-VERKEHR, No 1, 1984, p 8)

As a result of the "reevaluation" of these supply and purchase relationships from the perspective of transportation economy, and with the aid of optimization of transport, it was possible to reduce specific transport costs in this combine to 65 percent from 1980 to the beginning of 1985. As studies showed, the scope of cooperative relations could be reduced by about 10 percent, and thereby improved for transport, through improved organization of production without additional investment. (Footnote 91) (See Otto Arndt: "The Transportation Policy of the GDR," p 292)

However, connected either directly or indirectly with transport optimization, the following problems result for firms that have to ship:

--Transport optimization is not relevant for all firms, particularly not for those with a specialized production program. As a result of the high degree of specialization in industry, there are often only one or a just a few possibilities for the purchase of particular products. In the case of long transportation distances, and with shipments being shifted to the railroad, conditions arise which make the continuous shaping of the production process difficult.

--From the transport-economic perspective, the question generally arises about the need for the existence of highly productive specialized companies, which appear as monopoly suppliers within the GDR's economy. Although such a monopoly position cannot be avoided in exceptional cases, if existing transportation routes are taken into consideration, the tendency must be:

a. either an orientation toward a large number of smaller, more specialized, scattered production sites, or
b. the companies must expand their production program and thereby surrender some of their specialization. This means that the solving the tasks of transport optimization can, under certain circumstances, result in a change in the plants' production program.

--Many supply relations are so stable and well-established that to reduce their number with the goal of saving transport costs cannot be efficient, either for individual industries or for the entire economy. The enterprises in question would have had to accept increased expenditures in another form as the result of optimization. In the case of well-proven cooperative relations, which grew over a long period, specific product knowledge and experience, as well as mutual dependency in technology have often developed as the result of the need for close cooperation between the semimanufacturers and the end manufacturers. To destroy all this means to devalue knowhow in the broadest sense of the word and occasion temporary drops in efficiency. Many apparent successes in optimization, viewed over the long term, will have to prove their worth in this respect.

--Even if it has been possible so far to implement optimization measures for the most part without additional investment costs, there have sometimes been high outlays in the plants for production organization and technology. They have to adjust in differing degrees to the new supply relationship. An increase in the percentage of what they produce themselves, changes in the organization of production, as well as rationalization of the main and auxiliary production processes are the price paid for transport optimization, the shift in transportation and, as a result of this, conservation of diesel fuel.

--Many difficulties arose for companies that ship in the past as a result of the suppliers not honoring their obligations, as determined by law. That means deliveries were often not made on schedule and were not of the needed quality. (Footnote 92) (See Authors' collective: "Komplexe Produktions-Transportrationalisierungs-Erfahrungen aus dem VEB Werkzeugmaschinenkombinat '7. Oktober' Berlin" [Complex Experience in the Rationalization of Production and Transportation from the VEB October 7th Machine Tool Combine, Berlin], from the series: "Der Parteiarbeiter" [Party Worker], East Berlin, 1984, p 47) In an economy that divides labor, defects of this kind result in a chain reaction. In order to compensate for these interruptions, the plants were often forced to make use of their own vehicle pool. From the perspective of limiting works transport and of the associated shifting of shipments to the railroad, the stability of supply relations, i.e., primarily the adherence to contractually established performance parameters, is a basic prerequisite for the continuity of the factory production process. This applies even more when, as was mentioned above, transport by rail cannot offer a trouble-free alternative to work transport from a quality aspect. In addition, operating and bureaucratic costs (ordering deadlines, requisition requests, etc.) increase for the dispatching company when public transport is used.

--The increasing dependence of users in the economy on the carriers, resulting from the optimization measures, requires the buildup of capable and powerful information systems. Existing information systems are no longer adequate to meet requirements. Particularly for the planning and implementation of coordination in transport, new solutions are needed for transmitting and processing information, and these will have to be provided by the carriers and the users.

--As a consequence of optimization of supply relationships, there will be a growing tendency in the enterprises and combines to increase their materials inventory, particularly their contingency warehouse inventory so that they will be able to compensate for possible breakdowns in material deliveries. The resulting stockpile of working capital will increase the production fund levy (a kind of capital tax). It will probably be less of a burden on the enterprises than the sanctions that result from nonfulfilment of planned production volume caused by a shortage of materials. If there is any doubt, the unscheduled increase in inventory has fewer negative effects for the enterprise than being in arrears with plan fulfilment.

--In the opinion of experts in the GDR, optimization of delivery relations has "largely exhausted the possibilities of the first move to utilize available reserves." (Footnote 93) (See Authors' collective: Complex Experiences in Rationalization, p 41)

The considerable success achieved in the first few years of transport intensification gives rise to the conclusion that only negligible conservation effects can be expected from a "secondary optimization." New paths to reduce transport needs should be followed in future, designing products to be suitable for transportation and reducing the amount of material used in them, but also by possibly changing the structure of production and consumption. When the products are designed, the requirements must be met for full use of the space and weight capacity of the different means of transportation (if necessary, by breaking them down into units suitable for transportation). The factories are faced with the task of examining all products that have been in production for more than 2 years and determining their suitability for transportation. By doing this, the factories are simultaneously implementing another intensification measure, material conservation. (Footnote 94) (See Authors' collective, op. cit., p 50)

--In conjunction with transport optimization, the enterprises and combines are finding themselves increasingly faced with the task of rationalizing their auxiliary production processes, in particular the internal factory processes involving transport, transfer and warehousing (TUL processes). In permanent neglect before, because immediate production was at the focus of research and development and when investment capital was being distributed, these auxiliary processes represent a severe bottlneck. The disproportions within the production processes are not proving to be a hindrance to realizing existing and expanded production plans only since the new transportation strategy took effect. Since transport problems have become a priority for the entire economy, special importance attaches to the TUL processes. As analyses have shown, they are about 40-percent mechanized and employ a force of about 1.5 million workers, with a relatively high risk of accidents and under difficult working conditions. GDR experts put the cost of factory-internal handling at between M 31 and 33 billion annually. (Footnote 95) (See Gerhard Grossmann and Guenther Heinrich: "Handling Costs and Ways to Reduce Them," in: DDR-VERKEHR, No 9, 1984, p 263) Additional, and even present, tasks in transport strategy can only be carried out successfully if the level of these processes is raised significantly. Bringing the technical-technological level of the principle and auxiliary production processes up to standard by raising the degree of mechanization in TUL processes and introducing robot technology are indispensable requirements for making the solutions that are brought about as part of transport optimization permanent and efficient.

--Guaranteeing high-quality transportation is an objective which deserves special attention in the context of transport optimization. Caused by the shift of traffic from road to rail, which in turn was undertaken as part of the optimization of supply relations, broken shipments are developing into a key problem for the transportation system, but for the railroad in particular. Multiple transference of goods, as the result of a break in the transport process, strongly influences transport quality. The extent to which goods are handled can be seen from the fact that goods have until now been transferred at least twice in shipment outside the factory. The trend will be for the number of handling operations to increase. The transportation systems handles 20 percent of the total tranfers, and the shipping industry 80 percent. (Footnote 96) (Gerhard Grossmann and Guenther Heinrich, loc. cit.)

Inside the plant goods are transferred even more frequently, internal factory transportation is interrupted as many as seven times. In the case of bulk goods and fluids--which make up about 90 percent of the goods transferred--it is 3 to 10 times, for example. Mixed freight, which makes up 10 percent, can be transferred between 6 and 20 times, in machine construction it can be as many as 50 times. These examples illustrate the kinds of stresses that goods are exposed to even during the production process inside the plant and the importance that must be attached to transfer processes.

Comparable to the situation of the factories in the shipping industry, the problem in the transportation system is that the transfer processes, which make it possible to change carriers, also take place at too low a level. But it is the level of their equipment and technology that determines the extent of freight damage.

In contrast to the positive balance in transport performance shown by the economy at large and to the respectable successes achieved in shifting goods shipments, transport damage increased from 1981 to 1983 by about one-quarter, nothing being known about the extent of damage up to the beginning of the 1980's. (Footnote 97) (See Gerhard Christ: "Measures to Ensure Quality in Freight Transport," in: DDR-VERKEHR No 19, 1984, p 258) For railroad transport the following groups have been determined according to the cause of damage:

1. "Ignorance on the part of the consigner of the mechanical stresses involved during railroad transportation and underestimating its effects on the goods consigned.
2. The use of load units and packing designed for direct road transportation, but which offer no protection in the case of broken shipment in freight cars and multiple transshipments.
3. Defects in the design and/or quality of the products.
4. Belated or insufficient preparation on the part of the consigner to use new transport technology results in inadequate material-technical prerequisites to protect the goods during shipment.
5. Failure to comply with the complexity of TUL processes results in lopsided savings in packing or safety material or in its incorrect or inadequate use.
6. Violations of control technology (on the part of the TUL plants) results in poor quality execution of shipments." (Footnote 98) (H.J. Braune: "Examples of Rational Loading Technologies for Selected Types of Freight," in: DDR-VERKEHR, No 4, 1984, p 111)

A great part of the damage is caused by the effects of railroad transportation, i.e. by improper shunting (Footnote 99) (Unusual shock loads are created during shunting, when shock load and longitudinal stress presents a special risk for larger products and load units), defective equipment and shunting facilities, as well as by dampness, theft and accidents. The nature of the freight, i.e. its liability to breakage under normal stress during shipment, is likewise a reason for an increase in the incidence of damaage. (Footnote 100) (See Economy of Transportation, Part II, East Berlin, 1979, p 209; see Gerhard Christ, op. cit., p 76)

According to estimates by experts, 35 percent of the damage that resulted from being shipped could have been avoided with proper packing. The changes in shipping stress on the goods resulting from increased handling, longer shipment times and additional shunting would have to be compensated for by suitable packing and loading technology.

Inadequate preparation on the part of the carriers and the shippers for the requirements of transport intensification, as well as the previously mentioned inadequate level of handling processes, are further reasons for these phenomena. None of those involved in freight transportation were at all prepared for the changed conditions and stiffer requirements. This is the ultimate cause of the damage and the losses.

In the final instance, the effort to conserve material in general and packing material in particular, and at the same time to implement a major shift in transportation, cannot succeed in either individual industries or the economy at large. The exception is if fuel conservation alone is considered to be an objective and losses are discounted. It appears to have been a fantasy on the part of those responsible in the GDR's economy that goods poorly packed, with additional handling during shipment, and sent by rail would reach the addressee undamaged and on schedule, because reality has quite different results to show.

Now solutions to the packing problem are being demanded that require the minimum use of material, including reusable material, but also product development that considers transportation and conserves material.

Until the packing problem is finally solved, for example, by using box pallets or small containers, crates for bottles with a high insert, and boxes or trays made of corrugated carboard with dividers, a further shift of goods to the railroad will only take place when losses are accepted that affect individual industries as well as the economy generally. Apart from expenditures that result from the elimination of shipping damage, the change in transportation will entail a substantial added expense for handling services, packing and product changes. Then there remains the question of the price which has to be paid to achieve these transportation policy goals.

Binding rules for the optimization of transport relations are set out in planning, organization and cooperation law. Competencies, participation and coordination measures are established, and they manifest themselves in the drafting of contracts.

The following legal regulations are determinative in the regulation of transport optimization, bearing in mind that the shippers bear the principal responsibility for observing them:

--the law of 25 March 1982, concerning the contract system in a socialist economy--Contract Law--Legal Gazette I/1982, No 14

--the decree of 10 December 1981 on public goods shipment by rail, inland shipping and vehicle--Freight Transport Regulations (GTVO)--in the form of the Second Decree of 28 June 1984, Legal Gazette I/1982, No 2 and No 12/1982

--the directive of 31 December 1981 on determining transport needs and transport balancing--Transport Balance Directive (TBAO)--Legal Gazette I/1982, No 7 and

--the directive o f 1 April 1984 on the use of transport norms to improve planning, accounting and control of the economy's transport expenditures--Transport Norm Directive (TNAO)--Legal Gazette I/1984, No 10.

In the GTVO the "broad optimiztion of supply and delivery relations" is set out as a principle for freight transport in paragraph 1 (4) as a possible way of reducing transport costs.

Assignments, rights and obligation for state organs, combines and plants, as well as transportation boards are laid down with respect to optimization in the GTVO in paragraphs 2 through 5. Paragraph 5 states: "It is a principle that supply and shipment relations must be optimized."

The decree on combines similarly obligates the plants to set up rational cooperative relations with other combines and plants. (Footnote 101) (See decree of 8 November 1979 on VEBs--Trust Enterprises and VEBs--Legal Gazette I, No 38 p 355). By forecasting state transport indicators for drawing up plans, the companies are encouraged to realize this objective. The focus is on developing the plant transport plan. For the sake of completeness, reference should also be made to the Tasking Workbook [Pflichtenheft] for research and development assignment, what is known as the Tasking Workbook Decree [Pflichtenheft-Verordnung]. (Footnote 102) (See Legal Gazette I/1982, No 1, pp 1-12) It lays down that in the development of new products an optimal weight-performance ratio, as well suitability for transportation and handling, have to be considered in the desired performance parameters.

The Contract Law establishes in paragraph 54 the factories' obligation to make their shipments by the economically most suitable method transport and to enter into the appropriate agreements in the service contract. It is important to determine the site of the service (the customer's location) to prevent the shipper making pickups with the customer's transportation.

3. Works Transport

The general relationship between the railroad and motor traffic has already been discussed. What follows is an examination of a few selected problems in works transport with which the transportation industry sees itself confronted within the framework of the transport intensification measures.

Under present conditions the restriction of works transport and (or) its better utilization is seen as a principal source of fuel conservation. Works transport was continuously expanded until the beginning of this decade, because the constantly increasing division of labor in the economy and the change in freight structure demanded adequate availability on the part of the plants and the guarantee of matching transport quality, now--under changed enegy-economic conditions--a new way of looking at things prevails. Possibilities for reducing the plants' freight transport services are seen in the replacement of these services with both public vehicle traffic and the railroad and inland shipping. At the moment, quantitative savings are of paramount importance, while the qualitative aspects in the broadest sense are not being considered. The decisions being made are born of the need for demonstrable short-term results. The focus is on conservation, the problems stemming from it have to be solved in the short term, or they will continue to exist. The priority target for the intensification measures in works transport is those plants with between one and three vehicles. That includes about 75 percent of the plants with works transport. In contrast to plants that have a motor pool of 100 vehicles or more, factory-operated traffic with fewer vehicles is considered inefficient. This evaluation is based solely on overall economic considerations. According to this evaluation, the overall economic efficiency of the works fleet diminishes from an energy-economic standpoint " . . . the smaller the number of shipments directly connected with the production or consumption process and the greater the possibility of using public motor vehicles, the railroad or inland shipping as a replacement." (Footnote 103) (Werner Gross et al.: "Reproduction and Transport," in DDR-VERKEHR No 2, 1982, p 46)

As a result of this one-sided view, the factories' power of disposition over their vehicles was sharply curtailed, all opportunities of transferring shipments to the most energy-efficient carriers were mandated by the administration and the "socialization" of the means of transportation was pushed through on a broad scale. In practice it means the creation of factory transport groups, which are oriented toward specific industries or made up by area. As in the case of the joint use of handling equipment, vehicles that belong to one factory are used by several factories. Just as reducing the vehicle fleet and having the railroad make delivery and sales shipments is not efficient in every case for individual industries, this state-decreed form of "socialization" works against the interests of the factories in the same way. Apart from the increased administrative costs and a constant need to coordinate, the plants' ability to manage their capital assets is severely limited, because they have to make some part of their transport capacity available to other enterprises. This drawback is not made up for by the profits that the plant providing the transport capacity makes in the form of "leasing fees." They are not interested in income of this kind, because it does not compensate for the second drawback, which is above-average wear on the available transportation. Since the plants can only acquire new vehicles if there is a "state" allocation, even if adequate funds are available to replace worn-out ones, they are intent on not shortening the working life of their fleet by greater material wear and tear. Particularly as they remain responsible for repairs when the vehicles are in joint use, in spite of the long-standing problem with obtaining spare parts.

Overall, this form of transport intensification may possibly appear to be energy-economic from the perspective of the entire economy, but against it there are the substantial interests of those immediately affected in individual industries.

The factories are being pushed to implement current transportation policy objectives through a number of state regulations.

In addition to the Freight Transportation Regulations, which contain the dividing lines between the individual carriers and between motor traffic and factory transport, the coordination decree regulates the exact division of assignments between public transportation and works transport, as well as the coordination assignments for shippers. (Footnote 104) (Coordination Decree, loc. cit., pp 141-149) The following are to be assigned to factory transport:

1. Production-linked shipments of equipment by road--particularly shipments between plants as part of plant assignments, for which there are no delivery contracts on plant propert, between parts of the plant, within plant production areas, and so on.
   --broken load shipments in pre- or post-production processes to or from the railroad or inland shipping, at plants with transshipping functions
   --shipments for service and repair operations, for service, maintenenance and repair of producition and transportation facilities and their installations
   --trips for the collection or distribution of preassigned or subsequently assigned structural units in the supply area

2. Sales and supply shipments which cannot be coordinated because of area-specific haulage conditions. (Footnote 105) (Ibid., paragraph 6, p 143)

What is new in these regulations is that all road freight haulage that is peformed as part of works transport and public motor transport is subject to coordination and approval. (Footnote 106) (Ibid., paragraph 7, p 144) In practice this means that almost no unloaded vehicle can move on the roads of the GDR, because all the possibilities for finding a full load for the truck must be exhausted. This also applies to public motor transportation, because its shipments also have to be reported and coordinated. At this point reference should be made once more to the 30-km distance limit that applies to local traffic from one Bezirk to another, and to special regionally established distances. This regulation suspends any possibility of the factories managing their own vehicles. Even in the event of catastrophes, breakdowns and production stoppages, a shipment must receive approval. The sanctions for violations remain within reasonable bounds. This is when the contract law applies, although reprimands and fines threaten those responsible for using vehicles, as regulatory punishment.

The assessment of a long-distance transportaton surcharge and of a factory transport levy for making shipments by road which are carried out by enterprises with their own fleet, as well as a production fund levy if the equipment norm for motor vehicles is exceeded (norms which are presented to the the enterprises annually as binding normatives and limits), are additional methods for reducing the economy's transportation costs. (Footnote 107)

Directive on Additional Economic Measures to Reduce the Economy's Transportation Costs of 14 November 1983, Legal Gazette, I/1983, No 34, p 336) This directive states that, in the case of a shipment by road beyond a radius of 50 km from the loading site, the already existing long-distance surcharge is doubled. The factory transport levy is a special sanction for plants that make long-distance freight shipments with their own fleet. This levy increases manufacturing costs, because it has to be reported as a fine and compensation. It is deducted in the form of a product-associated levy to the state budget. If the equipment normatives for vehicles are exceeded, the factories in the shipping industry have to remit, for example, in addition to the customary production fund levy, an additional and non-plannable levy of M 5,000 per ton of payload monthly to the state budget (see paragraph 6).

Another directive aims in the same direction: reducing the motor vehicle inventory by scrapping antiquated vehicles. According to this directive, " . . .vehicles whose fuel consumption can be shown at the monthly accounting to be in excess of 5 percent above the established factory norm . . ." are immediately subject to inspection. (Footnote 108) (Directive on Material Recognition of Workers for Conserving Fuel with Motor Vehicles in Road Haulage of 20 January 1983, Legal Gazette, I/1983, No 4, p 39) In practice this means scrapping those vehicles. The factories have to establish operating norms for fuel consumption for each vehicle. In addition to the consequences already mentioned, improving on these norms is linked with a material recognition of the driver. Since the prizes for saving fuel are extremely varied, interest among the drivers in saving fuel is probably limited.

IV. General Estimate

In 1981, high foreign trade deficits and growing economic expenditures to meet energy requirements caused the political leadership in the GDR to revoke the transportation policy concept that had been in force until then and to promulgate a complex program of transport intensification as part of the general intensification of the national economy.

What was understood by intensification of domestic freight transportation was not only better utilization of available production factors; it included a reduction of the economy's transportation costs, conserving substantial amounts of diesel fuel, restricting works-owned truck traffic (factory transport), gradually replacing diesel traction in railroad transportation and reducing long-distance truck haulage in favor of the railroad and/or inland shipping.

The intensification program affected all carriers and the entire industry that makes shipments. The complexity of the assignment and the harshness of the deadlines stood in crass contrast to existing conditions.

They were typified by deficits in investment in all areas, the dominance of motor transportation, defects in the transportation system network, electrification being behind schedule, defective technical and technological equipment, an inadequate information system on the part of the carriers, as well as a low level of equipment in transportation, handling and warehousing processes, inadequate packing, economically inefficient supply and delivery transport relations and much more.

How little long-term preparation was undertaken for the new transport strategy emerges from the fact that the need for it was not announced until after the process of creating combines in industry was already completed, and thus the future supply and delivery relations for the factories were already established.

Under these conditions--increased material shortages on the one hand and a complete lack of any prerequisites on the other--the objectives of the intensification program could not be achieved by economic means (shortage prices) alone, so the GDR political leadership applied administrative measures more strongly. Attempts are being and were made, by the allocation of quotas and elimination, to push through the newly defined transportation policy. Administrative intervention has already reached a point where it largely restricts the interests of those in the shipping industry and its ability to react.

On the other hand, it should not go unmentioned that the efforts to intensify all processes in the national economy (for example, reducing the material intensity of products) can also have positive effects on the intensification measures in transportation. But transportation--although it is the beneficiary--would not have to take responsibility for these effects.

If one evaluates the results so far from a quantitative point of view, the general commission given at the 10th SED Party Congress to reduce specific transportation costs has been carried out. (Footnote 109) (See Otto Arndt: "The Transportation Policy of the GDR," p 290) In 1984 specific transportation costs, which express the ratio between freight transportation performance and national income produced, were about 22 percent below the costs for 1980. (Footnote 110) (Statistical Yearbook of the GDR 1985, p 85) To this extent success can be attributed to the rigorous conservation policy aimed at reducing the scope of services in the transportation system. In comparison to the initial year, 1980, 145 million fewer tons were transported until 1984, a drop of 13 percent, while production output of the manufacturing economy climbed. The freight transportation performance saved came to 6,409 million ton/km, about 8 percent of the transportation performance of 1980. (Footnote 111) (See Tables 2 and 3)

However, it would be premature to claim to see progress in intensification in this development. Analysis of the individual carriers shows that the 145 million tons saved are almost identical with the figure by which factory transport was reduced. On the other hand, against the drop in the volume of shipments of 13 percent is the rise in capital assets of about 17 percent in Transportation, Post and Telecommunications and an increase in the number of employees. This comes out to an overall decline in productivity with expanded factors of production, which contradicts the claim of intensification.

The processes that have taken place in domestic transportation do not yet fulfil the criteria of intensive business practice. One part of the results that can be evaluated as positive, for example, the reduction of inflated transport needs on the part of the economy that ships, comes from the elimination of "home-made" system defects by means of altering the indicators for evaluating performance (net production) and reducing the supply of transportation.

Other things, such as the savings in liquid energy sources, either cannot be judged in their long-range effects or the results are being bought at the cost of disproportions and increased expenditures in other areas. There is a strong suspicion that the end result at the national level of conserving liquid energy sources--measured at national prices--does not cover the associated cost increases for individual industries under any circumstances. But counter-calculations of this type are ignored in an economy which counts its expenses within the country in domestic currency, but can only pay for imports with return supplies.

It cannot be overlooked that the growth in high-price goods that was aimed for --an intensification target of the processing industry--will not only be limited to the transportation system in the sense of more efficient transportation performance, but will impose growing demands of a high technical level on the production of the means of transportation and on an adequate handling technology. Without investment capital for the transportation system and for the shipping industry, the additional transport intensification measures needed are unrealizable.

In this evaluation of the intensification measures the consequences for the environment have been completely left out of consideration until now. There is no argument but that the advancement of electric traction in railroad freight haulage--in comparison to diesel traction--has reducted pollution on the immediate enviromnment by the side of the tracks. But the result of this intensification is certainly out of proportion to the environmental damage caused by the open-cast mining of brown coal and its being burned in thermal generating stations. Also left out of consideration in this survey is the transport required for the coal and the ash, which accumulates in no small amounts when generating electricity.

The overall assessment is that domestic freight transportation in the GDR has not yet produced the proof of intensive business practices. The only success achieved so far has been to load antiquated materiel to its limit and to tap into reserves intrinsic in the system. Additional permanent and lasting results in intensification can no longer be brought about without a substantial improvement in the quality of capital assets and without the expansion and modernization of buildings and plant.

DOMESTIC ANIMAL CENSUS

AU031430 Bucharest SCINTEIA in Romanian 1 Feb 85 p 1

[Editorial: "Today the Domestic Animal Census Begins"]

[Text] As of today, 1 February, the domestic animal census begins in all localities. This is an action with great economic significance and is being carried out in order to acquire exact knowledge of the number of animals, according to species and age, possessed by agricultural units and private farms. All animal owners are called upon to assist the unfolding of this action, under the most favorable conditions. As is well known, the census gives the possibility to obtain detailed and complete information regarding the number of animals, poultry, and bee families existing at the date when the registration begins, that is, 1 February, at 0800. On this basis, the most appropriate measures will be taken regarding increasing the number of animals, ensuring fodder, and working out the entire set of technological and organizational measures designed to make a contribution to the more accelerated progress of the livestock sector. Among these measures, the ones referring to giving material support to the stock breeders so that they can fulfill their tasks of delivering the contracted animals to the state fund are very important.

In order to carry out the registration work under the most favorable conditions, thorough preparations have been made and an intensive activity of popularization has been carried out in order to acquaint all owners with their duties to declare correctly the number of animals they possess, thus easing the work of the census worker. As is well know, all those who do not declare the exact number of animals they possess are punished according to legal provisions.

The party bodies and organizations, the people's councils, and the specialized bodies have the duty and great responsibility to guide and closely assist the census commissions, so that they can carry out an entirely fruitful activity and can constantly be aware of the stage of the animal census.

[The following appeal is printed in a box at the end of the item.]

Agricultural Workers and Animal Owners!

Closely assist the activity of the teams which carry out the animal census by correctly declaring the number of livestock you posses; thus, you make your contribution to working out the measures that must be taken in order to develop the livestock sector and to fulfill the provisions included in the contract for delivery to the state fund and to the self-sufficiency fund!

BRIEFS

GEOLOGICAL RESEARCH FOR COAL--Bucharest AGERPRES 28/1/1986--In the last few years, geological research has intensified in Romania and new coal and oil shale resources have been tapped. Furthermore, studies have been conducted in the expansion of open-cast mining and the application of efficient and profitable technological and scientific solutions to extract coal from thin layers, pillars and less accessible despoits. The geological map of areas in the southern, central and eastern Carpathians, in the sub-Carpathians in Oltenia and Muntenia, in the western part of the Transylvanian depression, etc., has been sensibly changed. The productive collaboration between geologists and miners allowed for an effective passage to the exploitation of new deposits as early as the stage of geological tappings. New extraction units went on line at Timiseni-Pinoasa, Tismana, Poiana Cocoreni, etc., and new mining units were commissioned at Lupeni, Cimpa and in other areas of the Jiu Valley. With the exploitation of new coal and oil shale deposits new technologies have been expanded and units have been equipped with high-performance outfit. In the current five-year peiod, spaning 1986-1990, lignite and brown coal production will grow at a high rate to hit an annual 84-89-million-ton mark. [Text] [Bucharest AGERPRES in English 1212 GMT 28 Jan 86 AU] /6662

MERCHANT FLEET DEVELOPMENT--Romania's sea-going merchant fleet was recently equipped with three ships of various capacities and utilizations: the multipurpose cargo carrier "Posada" (15,000 dwt), general goods carrier "Nicoresti" (8,750 dwt), and the ore carrier "Baraolt" (65,000 dwt) built in the shipyards in Galati and Constanta. The first Romanian oil tanker (35,000 dwt) was launched from the Galati dockyards and other two ore carriers of 65,000 dwt are ready to go at sea from Constanta. The current capacity of Romania's merchant fleet--of more than 3.7 million dwt (Romania ranks tenth in the world from this point of view) is to be developed more in the ongoing five-year plan 1986-1990. In keeping with a special programme concerning the development and modernization of ship construction, the transport capacity of the Romanian sea-going merchant fleet will double over this interval. It will be mostly equipped with high complexity ships for specialized transport. [Text] [Bucharest AGERPRES in English 0910 GMT 6 Feb 86 AU] /6662

MILITARY INTERNATIONAL AFFAIRS

WARSAW PACT SMALL-CALIBER NAVAL ARTILLERY DESCRIBED

East Berlin VOLKSARMEE in German No 49, 1985 (signed to press 2 Dec 85) p 8

[Article by Commander H. Mehl: "Fully Automatic Naval Artillery"]

[Text] Surface vessels of the allied socialist fleets are equipped with fully automatic artillery of varying calibers to combat enemy air attack means and sea targets, as well as to provide fire support for sea landings. The artillery systems, which are almost without exception designed as on-deck assault guns, comprise an important component of the combat strength of the most varied types of vessels, in addition to available rockets.

Radar and Remote Control

It was possible to increase the firepower of naval artillery significantly because specialists had developed medium-caliber guns into fully automatic weapons and created multiple-barrel small-caliber guns. Furthermore, today all gun systems are equipped with radar fire control systems which have also significantly improved their accuracy, while taking various external ballistic factors into account. With respect to small-caliber guns with high rates of fire, however, visual aiming and firing processes have retained great significance, particularly since the fully automatic weapons are remotely controllable via so-called sighting columns equipped with extremely rapid electrohydraulic gun-laying drives. Frequently, several guns on one side of the ship or of the forward or aft regions are aimed and fired in a synchronized manner, thus achieving a high fire density. The necessity for the effective employment of small-caliber guns for close-in defense was adequately underscored by the events in the Falkland conflict of 1982. Thus, the British missile destroyer HMS Sheffield was hit by an air-to-ship AM-39 Exocet missile on 4 May 1982; during its approach, it was possible to make out and visually observe this missile for about 5 seconds. The HMS Sheffield, which was at the time the most modern missile destroyer in the British fleet, however, did not have any suitable artillery for close-in defense. After being hit, the vessel burned out completely and sank while under tow on 10 May 1982.

Cooling for Larger-Caliber Guns

Medium-caliber guns, from 76-mm through 130-mm, can today also fire bursts and, seen on an international scale, rates of fire from 40 to 70 rounds per minute are attained. Firing in bursts involving the above-named caliber weapons results in a high thermal stressing of the barrels. In order to keep this stress within tolerable limits, the fully automatic guns were equipped with the most varied cooling systems. Special fluids or cooling gases are used. As reserve cooling, ordinary seawater can be used in some cases provided by firefighting equipment. Retrocooling (heat evacuation) with respect to some gun models is accomplished via a permanent cooling mantle which, because of the barrel recoil, was equipped with a hose connection. With respect to most guns, the throughput or circulation cooling system is also fully automated.

Since very high rates of fire of small-caliber guns, amounting to between 2,000 and 3,000 rounds per minute, result in great thermal and mechanical stress with respect to the barrels, multiple-barrel so-called revolver cannon were developed. In these weapons, the bundle of barrels rotates during firing about its longitudinal axis. The barrel bundle itself is also enclosed in a mantle tube and is cooled.

Ammunition Supply

Ammunition for small-caliber guns is predominantly supplied via ammunition belts which house various types of shells in a predetermined sequence. The firing of the shells is handled electrically and requires only a few milliamperes of power. With guns of medium caliber, specially designed feeder systems provide shells from drum or cassette magazines which are, for the most part, located in the gun barbettes. Today, gun and barbette form a design unit which is mounted as a unit on the substructure of the ship. Electrical, electrohydraulic, or pneumatic auxiliary power for aiming drives and ammunition feeds are provided by special auxiliary aggregates or the on-board power net. The maintenance and upkeep of fully automatic guns is a very interesting and responsible activity. It requires a high degree of specialized knowledge, combined with great practical skills on the part of gunners and armorers.

REMOVAL OF TOXIC SUBSTANCES IN ARMED FORCES DETAILED

East Berlin MILITAERTECHNIK in German No 1, 1986 (signed to press 7 Nov 85) pp 21-22

[Article by G. Simon, graduate chemist: "Harmless Removal of Poisons"]

[Text] When the law governing poisons came into effect on 7 April 1977, its area of jurisdiction covering the harmless elimination of poisons was expanded. This took cognizance in this area of the need to protect the health of workers.

The harmless removal of no longer useful toxic substances is captured in the Toxic Substance Law [1], Section 4, Paragraph 2, and Section 10, as well as in the Sixth Implementing Decree Pertaining to the State Cultural Law [2]. The Sixth Implementing Decree generally regulates the harmless elimination of no longer usable waste products and includes toxic substances.

According to the above-mentioned implementing decree, unusable waste products include solid, muddy, or liquid wastes, as well as residues, for which there are no scientific, technical, or economic prerequisites with respect to their usefulness in the national economy as secondary raw materials at the time of their occurrence.

No longer usable waste products are:

a) toxic wastes,

b) other harmful wastes,

c) waste materials containing little or no harmful products.

In this contribution only the two first-named categories of waste products will be considered. Toxic waste products include those products containing toxins in Categories 1 or 2 in a concentration which makes them poisons in the spirit of the poison law. Other waste products containing harmful substances are waste products which are listed in the List of Harmful Substances [3] or poisons of Categories 1 or 2 in only slight concentrations so that they are not considered to be poisons in the spirit of the poison law. Examples of toxic waste products are listed in Table 1.

Table 1. Toxic Waste Products (Examples)

Waste Product	Incidence
Old acids	From batteries, used metal surface treatment acids, laboratory acids
Old alkalies	From printing plants
Cyanide	From metal surface treatment
Insecticides	From insecticide applications
Methanol waters	From laboratories and antifreeze
Tetrachlormethane	From degreasing operations

1. Responsible for Harmless Elimination

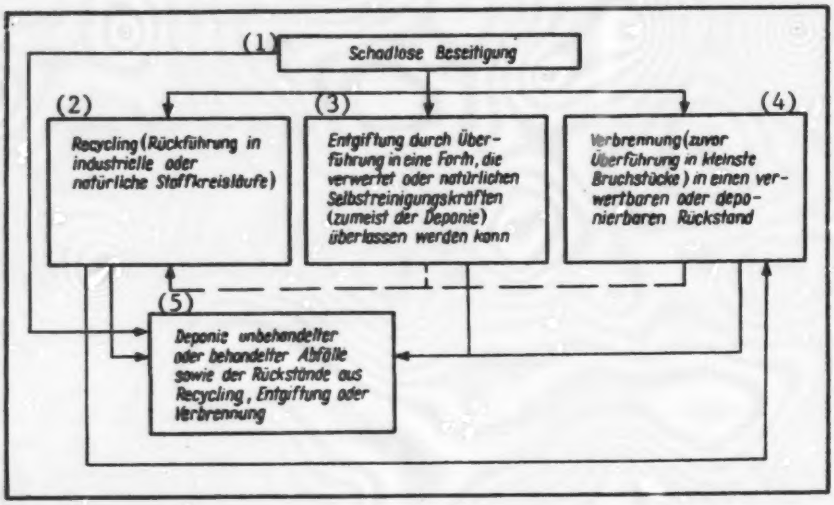
The harmless elimination of toxic waste products must be demanded of those official locations which generate them. Responsible officials are the chiefs/ commanders, directors, as well as other persons of equal rank. As a rule, they will task the individual responsible for toxic substances with the safe removal of these substances.

Toxic waste products will only be eliminated under consideration of provisions of the Environmental Protection Law. The endangering of life or health of people, as well as the damaging of the animal or plant environment, must be absolutely excluded. National economic damage is also to be avoided, as is a deterioration of soil, water, or the air. The harmless elimination of toxic waste products is only permitted to be accomplished if the responsible state organizations have approved the application.

2. On the Application and Approval Procedure

The application for the harmless elimination of toxic waste products is to be submitted to the council of the bezirk (specifically to the specialist for secondary raw material economy) which has jurisdiction over the unit location. Applications are only processed if proof is provided that the waste product cannot be used as secondary raw material at the time of the application. Proof constitutes a position adopted by the organs superior to the applicant or by an opinion on the part of one of the expert opinion facilities listed in Table 2.

In order to be able to judge the possibility of rendering the waste products into useful materials, the applicant must provide all necessary documentation and analytical data and, where necessary, comply with security provisions protecting secrets. The specialist for secondary raw material economy at the bezirk council decides on the permit to be issued for the harmless removal of useless waste products and passes the aplications on to the appropriate officer responsible for issuing permits. Toxic and other harmful waste products are the responsibility of specialist for environmental protection and water management at the council of the bezirk. This officer issues the permit and, at the same time, stipulates the type of elimination as well as the elimination facility to be used. Variations of harmless elimination of toxic waste products are shown in Figure 1.



(1)
Schadlose Beseitigung
(2)
Recycling (Rückführung in industrielle oder natürliche Stoffkreisläufe)
(3)
Entgiftung durch Überführung in eine Form, die verwertet oder natürlichen Selbstreinigungskräften (zumeist der Deponie) überlassen werden kann
(4)
Verbrennung (zuvor Überführung in kleinste Bruchstücke) in einen verwertbaren oder deponierbaren Rückstand
(5)
Deponie unbehandelter oder behandelter Abfälle sowie der Rückstände aus Recycling, Entgiftung oder Verbrennung

Fig. 1. Variations of harmless elimination of toxic waste products.

Key:
1. Harmless elimination
2. Recycling (returning to industrial or natural material circulation)
3. Detoxification through transposition into a form which can be utilized or can be left to the natural forces of self-cleaning (mostly to the forces of deposit-settlement)
4. Combustion (preceded by breaking up into the smallest fragments) to a reusable or depositable residue
5. Deposits of untreated or treated waste products, as well as residues from recycling, detoxification, or combustion

Table 2. Facilities Authorized To Issue Opinions on Waste Products [4]

Type of Waste Product	Facility Issuing an Opinion
Used solid salts	VEB Haertolwerke, Magdeburg
Mercury-containing wastes	VEB Chemical Works, Buna
Overlaid PUR components	VEB Synthesewerk, Schwarzheide
Mineral oil-containing residues	VEB Hydrierwerk, Zeltz
Used chemicals	VEB Laborchemie, Apolda
Residues from pharmaceutical production	VEB Pharmazeutisches Kombinat GERMED, home enterprise, Dresden
Arsenic-containing wastes	VEB Bergbau- und Huettenkombniat "Albert Funk," Freiberg
Toxic paint and solvent residues	VEB Druckfarben- und Lederfarbenfabrik, Halle

With respect to the National People's Army and the Border Guard of the GDR, a transformation into nontoxic substances or less-toxic solutions is practically only applicable for organic solvents and acids and alkalies. Organic solvents can be eliminated by combustion while adhering to work and environmental protection provisions; acids and alkalies can be eliminated by neutralization. A special problem is presented by the detoxification of small quantities of toxic by-products in laboratories. The method listed in the beginning of this article--in other words, the application for the harmless elimination of the substances submitted to the council of the bezirk, is hardly practicable for eliminating laboratory wastes. That is why Table 3 contains a few examples for detoxification of laboratory chemicals.

Table 3. Detoxification/Destruction of Laboratory Chemicals [6]

Chemical	Procedure for Detoxification/Destruction
Active chlorine compounds	Treat with $Na_2S_2O_3$ solutions (0.3 kg $Na_2S_2O_3$ per 1 kg of chloride of lime)
Alkalies, ammonium water	Neutralize with 6 M HCl and dump into sewer
Chlorosulphonic acid	While stirring in ice water drops, neutralize with NaOH and flush into the sewer with ample water
Acids	Cover with calcinated soda/slaked lime (1:1), mix with water and thin down; in the case of HF, immobilize with lime at a pH of 12 to form CaF_2 (polyethylene bottle should be used as reactor vessel!); larger quantities of phosphoric acid should be precipitated with the use of iron or aluminum salts into phosphate and deposited
Aldehyde	Burn in a solution (benzine, ethanol), methanol can be oxidized into methane acid with the use of water and can be dumped into the sewer system after neutralization, accompanied by plenty of water
Alcohols	Should be burned separately or in a solvent
Aliphatic amines	Cover with $NaHCO_3$, spray with a little water and flush into the sewer system with ample water
Liquid amines	Convert to a salt with $NaHSO_4$ and then burn
Halogen hydrocarbons	Mix with sand/calcined soda (9:1) or $NaHCO_3$ (in the case of fluoride compounds add slaked lime) and burn in the presence of paper, wood, or a solvent (caution: development of phosgene is possible!)
Chlorine	Introduce into a diluted alkaline solution and remove the appropriate hypochlorite through the use of $Na_2S_2O_3$ solution

If toxic waste products are eliminated in their native state, a destruction commission, headed by the toxic protection referant/poison official, is to be established. Perfect records are to be kept with regard to the occurrence and disposal of toxic waste products by type, composition, and quantity, and this record is to be kept, along with the proof documentation in accordance with military regulations governing toxic substances.

RELUCTANCE FOUND IN USING SIMULATORS, TRAINING DEVICES

Use of APC Trainer

East Berlin VOLKSARMEE in German No 37, 1985 (signed to press 9 Sep 85) p 4

[Article by Capt Rolf Basan; first paragraph is VOLKSARMEE introduction]

[Text] Following an exchange of experiences with advanced students, stable and repeatable results in firing training using trainers and simulators are guaranteed. Communists discovered additional reserves at the course in preparation for the party congress. VOLKSARMEE in the "Max Roscher" Infantry Regiment on the trail of a response to the speech made by Erich Honecker during his visit to the troops.

A promise is a promise! The many-voiced vernacular uses but three words to characterize this catchy expression. Now: no one needs to remind us of the promise which we made in VOLKSARMEE, No 14, 1985, on p 5. Under the headline "Trainers on Teeter-Totters and Under Tarpaulins" VOLKSARMEE dealt with the utilization of APC trainers. Good examples were obtained from the "Paul Hegenbart" Infantry Regiment which made the utility of these devices clear. There, they had a training complex mounted on tilting bars and it was being intensively utilized. Things were different in the "Max Roscher" Regiment because....

VOLKSARMEE had promised to ascertain during the second half of the training year that these APC trainers would not stand idle. And Comrade Erich Honecker was the one who, recently, during his visit with the troops, referred to the fact that the employment of training devices and simulators produced higher training results and, at the same time, affected savings in material resources. This is the thought that we wanted to pursue.

No Sooner Said Than Done!

The fire control tower of the firing range displayed a "red" signal. Staff Sergeant Major Werner Sanner is standing at the control console. This is the third training run for APC gunners of the "Huke" Infantry Company. Of course, they are not from the training facility. Two APC's are moving slowly toward the target area and are rocking gently. "During the third practice run, tank targets are combated with ball ammunition. This is not possible with trainers." SSgt Maj Sanner, who provides this information, turns out to be a knowledgeable conversation partner. Last December he had brought the three simulators from the producing enterprise. Even then the chief mechanic for APC turret armaments at the "Beckmann" unit had been enthusiastic about the many advantages which were listed in the appropriate literature: Three combat training vehicles can be saved. The gunners and guided missile controllers practice all activities involving weapons, targets, and observation instruments as well as those pertaining to guns and missile guidance systems in the actual APC. And: Trainers can observe all phases of activities in the turret and can train several soldiers at once.

Naturally, such a simulator does not completely replace an APC. But no one is demanding that. Simulators are primarily effective training aids. They serve to provide effective and intensive firing training. This is the argument used by SSgt Maj Sanner with superior officers and in the membership meetings of the SED basic organization. The training complex should be made usable for training purposes quickly. But there were questions: Who would be responsible for the maintenance and repair of the trainer? Who "would be wearing the hat" if something went wrong? Other problems turned up and were clarified through personal engagement and in the collective. (More on this can be found in our interview with Lieutenant Colonel Wolfgang Schneider.)

In the "Anton Saefkow" Motorized Infantry Regiment the training officers from the "Max Roscher" Regiment were able to observe a training complex in action. They collected valuable experiences, received answers to their many questions. But simple "copying" was not possible. An example: In the "Anton Saefkow" Regiment trainers were assigned to three units. Each unit was responsible for one trainer and used it to train its gunners and missile controllers. The advantage: clear relationships with respect to maintenance and repair. Disadvantage: If a unit would like to use all three simulators at the same time, it must first reach the appropriate agreements with its neighbors. In the "Max Roscher" Regiment things were different. There, one soldier assigned to the training facility is responsible for the entire training complex. Before each firing training episode, Private Michael Felsch turns over the simulators to whoever is responsible and, with them, checks the employment readiness of the simulators following the training session. "There can be no complaints," we have learned from him and, furthermore, we found out that during the past 4 months barely a day has gone by that the training complex has not been utilized. And there have been no malfunctions of the various modules. The simulators are said to be robust and very reliable.

This is pleasing information. The training of gunners and guided missile controllers began on simulators immediately following the time the training facility was provided with equipment. The responsible comrades took their promises very seriously and fulfilled them.

Good Simulators--Good Training?

Once more, a run of troops has returned from firing exercises. Corporal Frank Eisenblaetter passes a round out of the turret hatch. He had hit both tanks on the first try. He also fired at machine gun targets, expending less ammunition than expected. Ideal conditions? Lucky? "Neither, nor," he replied and smiled because he obviously did not owe his success to coincidence. On the contrary: "Strong wind gusts did not make it easy for me to compute the lead angle magnitudes. But what has been learned has been learned. We underwent frequent firing training using APC simulators; we also used them to fire our practice rounds. This is where I learned everything in order to be able to combat any target with the weapons of the armored personnel carrier rapidly and certain of achieving a hit." Major Ulrich Pekruhl was responsible for the training of gunners and guided missile controllers of the "Beckmann" unit and can confirm this. "The simulators are excellent devices. Our training officers are better able to recognize the individual weaknesses of every soldier through expanded control possibilities and can influence them appropriately.

However, the decisive point is, as always, the relationship between man and equipment. The APC simulators are not training automatons which can produce success in and of themselves. Their effectivity is determined by the abilities of the training officer. That is why training officers underwent a methodological training course of demonstrations on how the simulators can be effectively used. Form of training using the simulator complex which the comrades and the "Max Roscher" Regiment have dubbed "fire control" has proven particularly effective. In this problem each gunner/guided missile controller must independently recognize an undetermined number of targets. Small ones and large ones. While stationary and while moving. Near and far away. This demands the highest amount of concentration and the correct use of aiming and observation instruments. When a target is identified, the preliminary data for firing must be determined and reported. Finally, the target is aimed at and combated. "This is the way in which the simulators help us train the soldiers for the requirements of combat," says SSgt Maj Sanner. Good and very good results in all training exercises during this training half-year prove him to be right. We were able to convince ourselves of this also on this very day. All soldiers fulfilled the conditions of the third training cycle and thus proved the success of the effective and variation-rich training which can be facilitated with the use of APC simulator complexes. Does this say everything there is to be said? Certainly not. VOLKSARMEE will continue to pursue the question as to how trainers and simulators and other training aids, which we can find in all troop components, are proving effective.

A promise is a promise!

Unit Commander Interview

East Berlin VOLKSARMEE in German No 37, 1985 (signed to press 9 Sep 85) p 4

[Interview with Lt Col Wolfgang Schneider, commandant of the "Max Roscher" Motorized Infantry Regiment, by Lt Lutz Panhans; date and place not given]

[Text] Four questions addressed to Lieutenant Colonel Wolfgang Schneider, commandant of the "Max Roscher" Motorized Infantry Regiment, on the quest for more intensive and more effective training using simulators.

[Question] Comrade lieutenant colonel, what reactions were caused by the critical remarks published in VOLKSARMEE, No 14, 1985, about the unutilized APC simulators in your area of responsibility?

[Answer] In all honesty, it was unpleasant for us to be standing here as guilty parties in public. We do not normally have to hide our light under a bushel, so to speak. It also bothered us because, as could be seen from the contribution, the use of APC simulators, for example, had already been proven in the "Paul Hegenbart" troop component. In short, we immediately activated a study group, consisting of officers of the regimental staff and of the battalions responsible for the training of gunners and missile controllers. They were expected to study experiences which had already been made on the spot. Immediately after their return and after the training facility was equipped, the APC simulator complex went into operation.

[Question] What was the cause for this follow-up move in your troop component?

[Answer] Well, most likely in the old experiences which say that nothing ever happens on its own volition. Departmental thinking hampered some of those responsible in clarifying the question as to who would be responsible for the activation and maintenance of the APC simulators. The manufacturer had provided such detailed instructions which, in principle, excluded all doubts. In order not to create any additional administrative barriers, the communists in the SED basic organization joined the responsible training officers in order to remove all obstacles in the path of constructive training. What was particularly useful was the pressure by such comrades as Lieutenant Colonel Bodo Beckmann and Staff Sergeant Major Werner Sanner.

[Question] What first experiences do you see in the application of APC simulators?

[Answer] Some are pretty obvious. Since all preparatory training for the second and third training cycle can be accomplished under realistic conditions with turret machine guns using the simulator and, thus, the approach by real APC equipment is obviated, the savings in motor fuel are enormous. Added to this is the gaining of time and efficiency. Because the training officer can exercise immediate control, subjective evaluations are excluded and mistakes are checked immediately. Combat station training for all elements can be included, as can the overcoming of psychological inhibition thresholds involved in servicing the electric loading devices. Furthermore, available time for those responsible and for APC crews is increased with the elimination of time-consuming preparation and maintenance of the equipment. Also, the responsibility of one soldier for the entire training complex has proven to be effective. However, reserves are even now indicated, such as those identified during the conversations on preparations for the 11th party congress.

[Question] What are these?

[Answer] For example, training with respect to fire control for the entire platoon is conceivable provided the APC simulators are networked. There are also considerations indicating the possibility of gun-aiming training on the move. A supplemental instrument, which would be useful for this purpose, was discovered by us at an innovator fair of the military formation. We absolutely wish to devote more attention also to performance comparisons between units using simulator complexes. In conclusion, it can be said that: for the time being, there is no one who is not convinced of the advantages of APC simulators.

VOLKSARMEE Commentary

East Berlin VOLKSARMEE in German No 37, 1985 (signed to press 9 Sep 85) p 4

[Commentary by M.V.: "All Is Well That Ends Well?"]

[Text] A promise is a promise. This is how the above investigation regarding the use of APC simulators begins. Who does not know how difficult it sometimes is to actually implement this lofty word? That was the reason why VOLKSARMEE, as promised, granted with some mixed feelings, once more visited the "Max Roscher" Motorized Infantry Regiment. However, fortuitously, more had happened there in the meantime than the overdue activation of simulators. Progress was made, in the meantime, also with respect to military-economic thinking and action. And the communists, as can be read in the interview with the commander--were in the forefront. They removed barriers which had been considered to be invincible. But does this really mean that all is well that ends well?

Not at all. Because a once-attained good conscience does not, by far, make a permanent headrest. Those who were still behind 6 months ago and were studying the experiences of others tend to prove this. Today, they set the pace, they have recognized that there can be no limits to combat readiness, and they even see reserves.

For example, fire control for a platoon following networking of APC trainers or performance comparisons between units. But, in view of the sharpened imperialist confrontation course, can it be left to VOLKSARMEE to identify such good experiences and to publicize them? Or must study groups be activated in every area for this purpose? Do we leave it to chance whether a supplemental instrument, which is usable for gunner training on the move, is discovered at the innovator fair of the major military unit and is then also utilized? Or does each regiment invent its own?

During his visit to the Air Force/Air Defense Command, Erich Honecker said he considered the use of training devices and simulators to be very troop-oriented and he stressed that still better training results and material resource savings can be achieved in this manner. The general secretary of the Central Committee of the SED said that this contributes toward realizing comprehensive intensification, even in the military sector. VOLKSARMEE believes that intensification should include the exchange of the best experiences in a goal-oriented manner and continuously, even during service discussions among commanders. This is the cheapest investment favoring a maximum growth in combat strength and combat readiness in line with party congress goals.

The good final result of our investigation is a positive matter. However, this does not mean that everything is well. There are many locations where much can be done better. Consequently, VOLKSARMEE is far from satisfied and will also check in the future whether trainers and simulators are utilized effectively. After all, what is promised remains promised for the long pull.

ACTIVITIES, ACHIEVEMENTS OF CHEMICAL OFFICERS' SCHOOL

Warsaw ZOLNIERZ POLSKI in Polish No 46, 17 Nov 85 p 10

/Article by Leszek Ziolo: "In the Military Chemists' Workshops: Protecting Nature"/

/Text/ The Higher Officer School of Chemical Warfare /WSOWChem/ in Cracow is not just another educational center for young officer training. It is a breeding ground of interesting and original conceptions, inventions, and improvements, which provide for a valuable contribution by the military academy to the development of chemical sciences. Problems connected with defense and with protection against various kinds of contamination obviously prevail. In this area the Cracow officers have clocked in quite a number of major achievements.

The second mainstream of scientific research concerns qualifying papers, that is to say, projects undertaken towards dissertations which qualify /cadets/ for master, doctor, or assistant-professor degrees. It is not just a pursuit of "art for art's sake": solutions of theoretical problems promote practical solutions and provide a base for studies implemented not just by the military.

Finally, the third group of research includes papers which meet the needs of the national economy. They are undertaken to orders by the interested enterprises. Such undertakings require extensive knowledge in the area of chemistry and kindred disciplines, as well as specialized equipment and laboratories. In case of disasters, self-control and aptitude for swift decisionmaking are also necessary. In situations like these, there is no time for lengthy deliberations and experiments, decision must be made at once, or at worst following a few tests.

That was just what happened following a breakdown which took place 3 years ago at Dobczyce close to the Raba River. The outflow of toxic substances and detergents near the place where the Oil and Gas Exploration Company was engaged in research, posed a major threat to Cracow's drinking water intake. The situation deteriorated hourly. Finally it was decided to call on military chemists for help. Lt Col Marian Lodowski decided to neutralize the leak through sorption. It turned out to be the right decision.

Close to Problems of the Natural Environment

"The Dobczyce case was discussed at length throughout the region, and became well known in the chemists' community," says Lt Col Dr Stanislaw Warkocki, head of the chair of technical sciences at the WSOWChem. "Even earlier our teams had undertaken similar efforts, but saving Raba from biological death prompted various workplaces, unable to cope with chemical problems on their own, to call us for assistance. Of course, we could not oblige in every case. We preferred to engage in efforts which in one way or another might have enhanced our defense-oriented experience, or which might give our cadets an opportunity to do work liable to enrich their knowledge.

"We have also been involved in efforts which serve to protect natural environment," the colonel continues. "Not long ago a team of military experts prepared a system which prevents breakdowns of the chlorinating facilities used at the Celuloza plants in Wloclawek. Well, in case of a chlorine leak, such a disaster may trigger terrible consequences. We have therefore started strenuous, labor-intensive research, which allowed us to identify the most accident-prone points. We designed an electronic system for measuring contamination, and prepared a detailed contingency plan for rescue operations. According to our instruction, scores of special sensors were installed throughout the factory. One can therefore say that Celuloza achieved the best possible safety precautions. We have profited as well, since it was a rare opportunity to use a whole set of experiments with chlorine and its componds, and to look for the best ways and means to neutralize the gas. In addition, our school received a half million zlotys to buy teaching and laboratory aids."

Another example, this time from Cracow. Thanks to research undertaken by the WSOWChem, several local enterprises have introduced measures to remove plating cyanides.

Cyanides appear wherever metal is being plated. Those are strong poisons, their solutions dissolve gold and silver. Such dangerous chemical compounds, indispensable in modern industry, are--when disposed of as waste--never quite free of toxic properties. The Cracow chemists managed to invent a way for effective removal of cyanides from the environment. The method designed in the WSOWChem has been implemented since in the Szatkowski plants and in Alwernia; recently the Andrychow Compression Engines Manufacturing Factory has used it as well. Nothing prevents other enterprises from introducing similar infallible solutions.

How to Dispose of Heavy Metals

A breakthrough invention made at the Cracow military academy still awaits patents and distribution. Its authors allowed us to reveal some of their scientific secrets, and thus to become the first ones to disclose how to deal with heavy metaLs.

The problem, undertaken and successfully solved by a team led by Maj Dr Edward Brzezicki, concerned the technology of disposal of heavy metal salts from industrial waste. Let us explain it one step at a time.

Technology indicates something, which had not been there originally, but was created thanks to unflagging efforts of the entire team. Technology means therefore the way to do things. Military chemists have found the way.

To continue: heavy metal salts. Those are chemical compounds which consist of metals such as, for instance, cadmium, chromium, zinc, or lead. Each one is most harmful for people, animals, and plants. One of them, lead, has even been blamed of having brought about the decline of ancient Romans. Appalling amounts of lead are being found in their bones--because of their having used dishes and water pipes made of this metal. Because of lead, successive generations had degenerated, and when healthy peoples from the north threatened the city of Romulus, the Romans, "stuffed" with lead, were unable to mount an effective defense.

While it is true that we do not use leaden dishes, lead appears in automobile combustion fumes, in the smoke of power stations, and in industrial waste. Let us hope that the latter source of heavy metals pollution will soon be neutralized, thanks to the method worked out by Maj Brzezicki and his aides.

"I was glad to approve the suggestion to look for means of effective disposal of heavy metals from the environment," says Maj Brzezicki. "It is a major satisfaction for anyone who dabbles in science to be able to serve nature and the man's natural environment. For me personally it was a particularly close subject, since the military has taught me to care for the natural environment. I remember exercises at the firing range, when I was still wearing the cadet's uniform of the Military Technical Academy. We were most careful to leave the woods in the same condition we had found them, and not to cut a single branch without good reason. I have retained this respect for nature."

To come back to the major's research: Numerous factories use heavy metal salts in production, or else turn them out as by-products. Those salts, as waste, reach drains and purification plants.

None of the methods actually used guarantees total elimination of such salts. They are being more and more diluted, more and more dissolved, until they reach a degree of concentration which is no longer a health hazard; unfortunately, they have the nasty propensity for secondary cumulation. Moreover, how long can you go on diluting them?

"Our method, in a nutshell, consisted of finding an absorbent which thoroughly gathers heavy metal salts," explains Maj Brzezicki. "Absorbent is a substance on whose surface particles of another substance gather. In our case, such 'other substances' meant heavy metal salts. We had to find out a compound which would attract heavy metal salts from the mass of waste, like a magnet which attracts file dust. After protracted experiments, which lasted for many months, after having tested thousands of substances in our laboratories, we finally found such an ideal absorbent. Not expensive, easily accessible, and perfectly absorbing the most dangerous pollutants. Now the major effort of our entire team should soon be crowned by patents."

Military chemists tested the new absorbents in the sewage-clearing plants of the Cracow Communication Equipment Factory. The results allow for optimism. Let us also add that, while testing the absorbing properties, they have found many interesting substances which might be successfully used to neutralize lethal chemical weapons.

Phials With a Mysterious Substance

Col Warkocki has no doubts that the technology designed by his subordinates will find a lot of interest in the industry and among "environmentalists." There are sure to be more parties interested in cooperation, and orders will keep coming. Only a part of them may be fulfilled.

During our conversation the subject of accidents and breakdowns keeps recurring.

"We mentioned Dobczyce," recalls the colonel. "That was a natural disaster, but quite a different event recently took place near Tarnow, where human carelessness was to blame."

As it happened, a tank with 18,000 liters of concentrated muristic acid, started on a long journey. The vehicle with its dangerous load had no pilot, and what was worse, the driver had no idea what he was hauling! Unfortunately, at a hair-pin bend the tank overturned and fell into a ditch. The driver called for help. A tractor arrived and tried to extricate the vehicle, using a rope fixed to a valve. The valve gave up and muristic acid started to leak out in steaming fumes, filling the ditch and covering the roadway. Firefighters and police were alerted. Somehow, somebody called the WSOWChem. A team headed by Maj Brzezicki immediately arrived at the site. They managed to stop the leaking acid, and chemists then neutralized the spillage. But what might have happended, had all of it spilled over the fields? The whole area might have been lost to man for many years to come.

Chemists are being approached by people asking for expertise or for disposal of substances of unknown origin. The National Museum, for instance, asked for neutralization of arsenic, mercury chloride, phenol, and "one-liter containers of unknown liquid." One cannot refuse, but first it had to be ascertained through tests what this "unknown liquid" was all about.

Once, the major was woken up in the middle of the night. Some mysterious phials, labeled by a death's-head, had been found in an attic. No one was brave enough to dispose of them. The major not only took them away, but submitted them to meticulous tests, which revealed that it was muristic acid, used in wartime to start fire extinguishers.

One could recall many other tales about various achievements of military chemists, about their generosity and mastery of their trade, about their inventions and ideas which serve the economy, nature, and society. They themselves regard their contribution to the environment as something very natural and very necessary.

DEVELOPMENT OF MILITARY SOCIAL SCIENCES NOTED

Warsaw ZOLNIERZ WOLNOSCI in Polish 18 Dec 85 p 3

/Interview by Lt Jan Borkowski with Prof Col Stanislaw Jozef Sokolowski: "The Rank of Social Sciences"; date and place not specified/

/Text/ Col Stanislaw Jozef Sokolowski, professor and cerified doctor, is the commanding officer of the Educational Studies Department, at the Feliks Dzherzhinskiye Military Political Academy. His research and teaching activities deal with problems of logics and philosophical methodology of concern to the military. Among others, he published: "Logics in Command and Management" (1972); "Decision and Action" (1975); "Philosophical Problems of Military Social Sciences" (1981).

Lt Borkowski: One can probably accept the following statement: Civilization breeds growing complexities in human life, as well as in the acts of individuals and human collectives.

/Answer/ Yes, that observation is not only logically sound, but--what is more important--actually relevant and significant. The evolution of civilization does indeed shape in various ways the contemporary human condition and man's individuality, as well as the way he participates in ongoing sociopolitical, economic, and cultural processes. The most essential point here concerns, in my view, the dynamic and the range of transformations usually described as the civilization metamorphoses. In this case we have in mind changes in areas such as economics, technical progress, technology, communication and information, as well as various stages of organizational activiites. The changes are multifaceted, mutually interdependent, and their accuracy and directions pose problems which are not just--or even not mainly--technological or organizational, but social and human ones. This happens because of the danger of ignoring or neglecting the role of man as the substance of the civilization processes, that is to say, of man as the supreme value; the point has been most explicitly made, for instance, in the draft program of the CPSU, as well as in the draft program submitted to the PZPR 10th Congress. The socialist educational system pays heed to this problem, and suggestions for its solution can be found in the party's programmatic documents.

/Question/ In W. Szewczuk's book, "Psychology in the Service of Life," one finds the following statement: "At the turn of the 19th and 20th centuries, when psychology was becoming a science, G. Heymans, a Dutch psychologist, predicted that after a century of accomplishments in the natural sciences and in the ensuing technology, what lied ahead was a century of hegemony of social sciences, with psychology as their vanguard." I do not wish to detract from the enormous achievements of natural and technical sciences, but I think G. Heymans was not mistaken in his forecast.

/Answer/ Yes, the rank of social sciences has indeed gone up for several reasons. Without undertaking a broader analysis of this interesting, but at the same time complicated, problem, I would like to point out that one of those reasons derives from the earlier mentioned problems of civilization. Social and liberal sciences are the ones destined to set out proper diagnoses and prognoses concerning the condition of the contemporary man, as well as to suggest actions whose implementation might bring its expected and desirable transformation. In other words, social sciences should suggest and justify directions and dynamics of social development and civilization, bound to strengthen the role of man as the substance, his supreme role in the general development of civilization.

/Question/ Professor, in the October issue of WOJSKO LUDOWE you wrote in an article, "The Subject of Their Research: The Military Community:" "Science is one of the elementary premises for actual and organizational improvement of military practice. What criteria do you use to define "science?"

/Answer/ The notion of science and its understanding are most complicated issues. To put it in a most general way, one can claim that science is a system of statements and hypotheses, methodologically verified, and socially and cognitively significant. Obviously that is not a definition of science, but only a suggestion for its interpretation. In social sciences, for instance, both interpretative and evaluative theses are relevant, that is to say, the axiological function is also important in some areas of contemporary science. What is practically significant, concerns the cognitive and the social functions of science, including its cultural and praxeological functions as well. The latter one signifies that science contributes to the improvement of man's actions, to the growth of their effectiveness and efficiency.

/Question/ Military social sciences emerged as a branch of research and teaching disciplines, and took shape following the Second Congress of Polish Science. From the point of view of the above mentioned criteria, how could one briefly rate their accomplishments?

/Answer/ Military social sciences are one of the branches of contemporary liberal sciences, and whatever justifies their separate treatment within other social disciplines, concerns mainly the subject matter of their research, namely the military community. Within these disciplines problems are being formulated, which deal with military life, with educational processes, as well as with party and political training activities in the armed forces.

/Question/ What subjects do military social sciences include?

/Answer/ These sciences include, for instance, disciplines such as military pedagogy, psychology and sociology of the military, or theory and methodology of party and political activities. Historical and economic disciplines, such as defense economics, also have their place among them. These disciplines are just examples, since full classification of such sciences, which after all are just parts of the Marxist-Leninist military science, can be found in appropriate specialized textbooks.

/Question/ The methodology of military social research takes a special place in the research projects undertaken inside the armed forces. Why are the methodological problems of such significance?

/Answer/ The significance of methodological problems is closely linked to the role science, including social sciences, plays in the armed forces. The effectiveness of these disciplines depends clearly on the degree to which they might be able to reflect genuine problems of military life. Relevant diagnosis of such problems, as well as their effective solution, would be possible only if we had appropriate methodology at our disposal. Hence the importance of methodological reflexion and culture in research and in educational activity in the military. I would like to say with utmost satisfaction that this point of view has been fully approved by the proper command authorities in the military; this makes possible the propagation of methodological knowledge and culture in the main departments of military education.

/Interviewer/ Thank you for the interview.

ROMANIA: U.S. HISTORIAN'S BOOK ON TRANSYLVANIA REVIEWED

AU281902 Bucharest AGERPRES in English 1702 GMT 28 Jan 86

[Text] Bucharest AGERPRES 28/1/1986--One of the remarkable achievements of the Scientific and Encyclopaedic Publishing House of Bucharest in 1985 is the publication in English of the book "The Idea of Nation. The Romanians of Transylvania, 1691-1849" by reputed American historian Keith Hitchins. It is to be published in French, too.

The author, professor at the University of Urbana, is well-known among experts as, for more than two decades, he has published studies on the Romanian people's history and culture, both in the USA and Romania.

A crowning of thorough research work, the new synthesis traces the development of the idea of nation with the Romanians of Transylvania between the end of the 17th century, when the principality of Transylvania was incorporated by the Habsburg empire, and the 1948-1949 revolution.

Outlining the social and political structures in Transylvania at the beginning of the surveyed period, the author shows that the Transylvania Romanians continued to be subject to double oppression. Though indigenous and making the majority in the Carpathian arc, they had to endure, beside social oppression, national discrimination instituted by the mediaeval pact "Union Trium Nationum" concluded by the privileged strata--Magyar nobles, Saxon patriciate and Szeckler commissioners--against the Transylvanian serf peasants after the stifling of the 1437 uprising at Bobilna.

Consequently, they were deprived of the right to participate in political life, the Romanian church was excluded from the admitted religions and, generally speaking, the Romanians were considered "tolerated" on their ancestors' land. The incorporation of the ancient Romanian province into the Habsburg empire preserved those oppressive and anti-Romanian feudal institutions, as the author notes, who also enlarges upon the fights waged by the Transylvanian Romanians against various forms of the Habsburg policy aiming at their denationalization.

It is in this context that the author includes the daring fight of Bishop Inochentie Micu (Greek-Catholic, 1929-1751), who claimed the Romanians' equality of rights with the other coinhabiting political "nations". The American historian shows that Inochentie Micu based his request on the fact that Romanians were the majority population in Transylvania, that "they were entitled to a place of privilege because they were the oldest inhabitants of the land, having resided there continuously since the time of the Roman emperor Trajan in the second century".

The author also surveys the works of enlightened Translvanians Samuel Micu, Gheorghe Sincai, Petru Maior, Ioan Budai-Deleanu who were continuators, in the 1770-1825 period, of Inochentie Micu's fight. They were a generation that distinguished itself not only through valuable historical and philosophical writings but also through their firm commitment to the fight for national emancipation materialized, among other things, in numerous petitions of which better known is "Supplex Libellus Valachorum" (1791). K. Hitchins assesses that the Romanian national feeling was to reach its modern form about the year 1848. The merit for it is due to the learned and political militants of 1848 like T. Cipariu, S. Barnutiu, A. Treboniu-Laurian, G. Baritiu, A. Iancu, Al. Papiu Ilarian, who made of the Transylvanian Romanians emancipation their credo. The author shows that the political fights of 1848-1849 highlighted the need to make efforts toward political organization and economic development, for the union of the Transylvanian Romanians with their brothers across the Carpathians, an aim that governed their actions till 1918 when it was to be attained.

Hitchins analyzes the facts in the European historical context. He highlights the positive influences of the liberal ideals in Hungary on the thinking of the generation of Romanian intellectuals, pointing out that they received enthusiastically the intentions of the Hungarian liberals regarding the reform of the economic and social relations in Hungary and Transylvania through the abolition of the feudal servitudes. This is how he explains the fact that in 1848--contrary to some hasty assertions--the Romanians were not hostile to the Hungarian revolution in the beginning, producing proofs of the confidence shown by Cipariu, Baritiu, Iancu in the Hungarian liberals' attachment to all peoples' right to develop free, as national entities.

Professor Hitchins makes an in-depth analysis all along his survey. The work is also impressive through the solid and wide-scope documentation from Romanian and foreign sources, their attentive analysis, the successful efforts made for deciphering the nuances, the logic of the arguments, the stringent, clear presentation of problems, the pertinent and objective character of the conclusions that coincide integrally, on the major questions, with those of the Romanian historians, attenting to converging preoccupations for the observance of historical truth.

NEED TO COMBAT SOVIET 'FALSIFICATION' OF COUNTRY'S HISTORY

Tirana REVISTA PEDAGOGJIKE in Albanian No 3, Jul-Sep 85 pp 57-66

[Article by Agron Gani, Faculty of History and Philology: "The Anti-scientific and Reactionary Essence of Views of Soviet Revisionist Historiography on the Subject of History"]

[Text] The history of modern times and the history of Albania are among the subjects where the most important events and phenomena of world and national development are treated from the positions of Marxism-Leninism, particularly, such great events for our people as the anti-fascist struggle for national liberation and the period of socialist construction in Albania.

Connected with these important events is the task of our schools, which, supported by the teachings of the Albanian Workers Party and the works of Comrade Enver Hoxha, refutes in a reasoned manner the reactionary and anti-scientific views of bourgeois and revisionist authors who, having great means and funds at their disposal, have been mobilized with all their forces to belittle, slander and deny the anti-fascist National Liberation Struggle of the Albanian people, led by the PKSH [Albanian Communist Party] (today, the AWP) and Comrade Enver Hoxha for national liberation and the triumph of the people's revolution in Albania.

In this area, an important place is occupied by the Soviet revisionist authors, who flagrantly distort historical truth and have long ago cast aside all scientific objectivity, arriving at a flagrant falsification of the historical reality of the documents of our historiography.

In this article, we will consider the method of developing a critique of the views of Soviet revisionist historians regarding our struggle for national liberation in the subject of the history of modern times, in the lessons regarding the Second World War, and still more in the subject of the history of Albania, in areas relating to the Anti-fascist National Liberation Struggle of the Albanian people.

In the history of modern times, in subjects connected with the Second World War, and still more in the history of Albania, in subjects regarding the Anti-fascist National Liberation Struggle of the Albanian people, history teachers have made it clear to students that many Soviet revisionist authors, such as politicians, high-ranking mioitary officers, journalists and historians, distort the facts and create various absurdities in order to "prove" that allegedly the struggle of the large allied states of the anti-fascist coalition (England, the USSR and the U.S.) was the decisive and only factor in the liberation of Albanian and in our people's revolution. They claim that the struggle of the Soviet Union, in particular, was the major factor in the liberation of Albanian and in the victory of our people's revolution. These views and distortions have even been expressed in the highest Soviet state organs and by the highest authorities, not to mention their appearance in the official press of the Soviet revisionists. Thus, the congratulatory telegram sent by the Presidium of the USSR Supreme Soviet to the Council of Ministers of the People's Republic of Albania, on the occasion of the 17th anniversary of the liberation of Albania, said: "The decisive factor which gave the Albanian people the opportunity to cast off the foreign yoke and establish the people's power in their own country was the destruction of the German fascist hordes by the Red Army."[1]

We also encounter this viewpoint widely in the works of Soviet revisionist historians which are devoted to the Second World War or to particular aspects of it. In order to argue against it, teachers can show their students that A.A. Grechko, ex-minister of defense of the Soviet Union, in his collected memoirs in the book, "Permes Karpateve" [Across the Carpathians], wrote that the assault operations of the Red Army in 1944-1945 played the decisive role in liberating the peoples of Austria, Albania, Bulgaria, Hungary, Norway, Poland, Romania, Czechoslovakia and Yugoslavia from fascist occupation.

It thus becomes clear to students that the Soviet authors deny and disparage the struggle of our people and of other peoples who also shed their blood for the common cause of destroying fascism.

The teacher stresses to the students that the Albanians do not deny, as the Soviet revisionists claim, the important role of the peoples of the Soviet Union and of the Red Army, led by J.V. Stalin, in the dstruction of fascism on a world scale. This was a great help and a very important factor in the achievement of victory over the treacherous invaders by the enslaved peoples, and therefore by the people of Albania as well. This was stressed by Comrade Enver Hoxha, when he presented the first government program of the AWP in March 1946: "One of the most important factors in the victory over fascism and, therefore, a major external factor in the liberation of our country is the glorious place of the USSR."[2]

Supported by the ideas of Comrade Enver Hoxha, the teacher reinforces in class the idea learned earlier, that the major factor in the liberation and development of a country is the internal factor--the mobilization and launching into combat of all the material and moral forces of the people. This is all the more true for our country, since it is known openly that neither the Soviet Army nor any other foreign army set foot on Albanian territory. Our country is the only country in Europe which was liberated by its own forces, without the need of foreign military forces. Foreigners did not fight alongside our people within Albania. It happened that the Albanian people, without in any way denying the help of the allies as an important factor in destroying the common Nazi and fascist enemies, fought by itself, tooth and nail, shod and barefoot, dressed and stripped, with arms and with every other implement that was at hand.

In order to reinforce this idea, the teacher can read to the students the following quotation from the work of Comrade Enver Hoxha: "During the Second World War, the Stalinist Soviet Army displayed heroism and made great sacrifices; it gave brilliant proofs of internationalism and it gave the death blow to the German invaders. But if we ourselves had not fought, if we had not had our strong, unbending party, we would not have achieved victory and complete liberation of the fatherland."[3]

It is important that the students should understand that the Soviet revisionist authors widely utilize another method as well in order to deny and disparage our national liberation struggle: silence in the face of the reality of the life and death struggle of the Albanian people against the Italian and German fascist hordes. Thus, one Soviet historian writes that in the countries of Europe, in the summer of 1944, the national liberation movement was broadened and that great successes were achieved in the fight against the fascist invaders by the national liberation army and the partisans of Yugoslavia and the patriots of Greece, Italy and other countries. Albania, in this case and in other publications, is not included among the countries which engaged in armed combat against the foreign Nazi and fascist invaders and the native Quislings, which implies that there was no movement in Albania, that the German invaders sat with their legs crossed in 1944 and ruled without encountering any resistance--in flagrant opposition to historical truth. It was precisely in 1944 that the Albanian National Liberation Army successfully smashed two large operations involving many German and Ballist [Balli Kombetar-National Front] forces. After the defeat of these operations, it launched a general attack which ended in the expuslion of the German invaders, the destruction of the traitorous Ballist forces and the complete liberation of the country, without the need of having allied armies enter Albania from outside.

It is important for teachers to know that the Soviet revisionist authors, confronted with the facts of documents which speak about the self-sacrificing 5-year national liberation struggle of the Albanian people, try to find new ways and forms to denigrate it. They treat our struggle in a simplified manner, as though it was engendered, developed and stimulated by the events which occurred in the Balkans and elsewhere. The Soviet revisionist historians speak very little about the struggle of our people and neglect the key moments and most important events of the heroic struggle of our people, as well as our general armed revolution. Thus, one Soviet revisionist historian, in an article published in 1978, treats several Balkan events, which according to him, allegedly influenced and determined the attitude of the Albanian people in support of the liberation struggle of other peoples. Included in these events are the Italo-Greek war and German aggression in the Balkans in 1941.

It should be emphasized to students that the aim of Soviet revisionist historians is to present the beginning of our people's struggle as having been stimulated by external causes and events. Aside from this, their aim is to deny the struggle of the Albanians and their resistance during the years 1939-1941, under the leadership of the communists, apart from the fact that they had not created the Communist Party. This accusation is refuted by confrontation with historical truth. Teachers remind students that little Albania was the first victim of Italian fascist aggression in the Balkans. Although it was betrayed by King Zog and the rich bourgeois landlord classes, a heroic armed revolt was made against the Italian fascist invaders on 7 April 1939, at a time when Albania's neighboring states, not to mention those of Central and Western Europe, were exhibiting solidarity with fascist aggression. There is great value, particularly, in Comrade Enver Hoxha's statement that: "We were the first state in Europe to become the prey of Italian fascism and the first people to fight with arms without expecting others to enter the war. As in 1939, when Europe was silent," declared Comrade Enver Hoxha from the court of the Paris Peace Conference on 21 August 1946, "the sons of our country were falling on the field of honor for a just cause which, a little later, would become a cause of all mankind."[4]

In the face of the confrontations and distortions of Soviet revisionist historiography, we must present the facts and their accurate interpretation, whcih we find embodied in the teachings of the AWP and the works of Comrade Enver Hoxha. Supported by these, we demonstrate to the students, with real facts, that the heroic resistance of the Albanian people against the fascist invaders began immediately after the occupation and continued and developed with ever increasing strength and in all forms. The great mass demonstrations of the years 1939-1941 were drowned in blood. The data indicates that 6,500 anti-facist Albanians were thrown into prisons or concentration camps constructed in Albania or Italy. Many others were massacred in cities and villages of Albania for anti-fascist activities. Evidence of the resistance of our people is also provided by the fact that in 1939, there were more than 3,000 Albanian anti-fascists who had left the mountains and were making continual armed assaults against the Italian invaders and their tools. They represented the core of the subsequent partisan fighting units. But in the anti-fascist movement were also included thousands of other Albanians in cities and villages, who fought the enemy in the most varied ways. The whole Albanian people was conscientious in its heroic undertaking, which was filled with dangers and sacrifices: it was conscious of the fact that these battles would determine its fate and existence.

Criticism of the views of Soviet revisionists who attempt to present the Albanians as cowards, as people who avoided fighting the fascist enemy during the years 1939-1941 is also a matter of concern. The teacher can tell his students that the Soviet revisionist authors of Voljme IV of the work, "Historia e Luftes Dyte Boterore" [History of the Second World War], published in Moscow in 1975, write that in 1941, in the deep mountain regions of Albania which are difficult to cross, platoons and small partisan fighting units hid themselves, were still in the formative stage and seldom entered into armed encounters with the enemy.

The students understand clearly that a more overt degradation is not possible of our people's struggle, about which Comrade Enver Hoxha writes: "You were never afraid of slavery of the swords of the enemy or his cunning or his burnings or his killings; you never bowed your head before foreigners and before treachery, but always stood tall, with head erect. In your belt, you carried pistols inlaid with silver, on your shoulder you carried flintlocks, in your hand you held a naked sword and you fought with fury.... History has taught you that those peoples who do not fight disappear, so you, my people, fought for freedom, for your language, for your customs, for your sacred soil and you did not disappear, but triumphed."[5]

In order to refute the slanders of the Soviet revisionist historians, we remind our students that the fighting unit of Peze did not hide in deep, inaccessible places, but operated with ever increasing strength in the immediate vicinity of Tirana and Durres. Its unceasing and completley efficacious assaults caused great alarm in the ranks of the enemy. The carrying out of several consecutive operations by Italian troops against the region of Peze, where the partisan forces led by the Hero of the People, Myslim Peza, were acting, indicates best that Albanians from the four corners of the country were in continual struggle with the occupier. Gradually, the partisan struggle caught fire not only in Peze, but also in Mallakaster, Skrapar, Kurvelesh, and Cermenike.

In treating the Anti-fascist National Liberation Struggle of the Albanian people, the teacher must bear in mind, in his criticism of Soviet revisionist historiography, the fact that the revisionist authors attempt to ignore or distort such important events of our struggle as: the general armed insurrection in its three phases, the failure of the enemy operation in the winter of 1943-1944, the spring assault by our national liberation army in April-May 1944, the failure of the enemy operation of June 1944, and the actions and general assaults of our amy which led to the conclusive victory of 29 November 1944 and to the complete liberation of Albania.

Another important problem which must engage the attention of the history teacher, in connection with the problems of the Second World War and, in particular, of the Anti-fascist National Liberation Struggle of our people, is the unmasking, by means of scientific arguments, of the absurd claims of Soviet revisionist historians regarding the so-called assistance with arms, various military materials, financial resources and even troops, which the Soviet Union supposedly gave Albania during the war years. Thus, one historian writes, in an article published in the revisionist journal NOVAYA I NOVEYSKAYA ISTORIYA, that the material assistance given by the Soviet Union to the national liberation army played an important role in the liberation of Albania. Another work goes even farther. It claims that allegedly during the year 1944-1945, the Soviet Union gave our national liberation army 350 cannons, about 1,000 automatics, more than 15,000 rounds of rifle ammunition, and a great deal of other military materiel. The absurdity reaches its height when it claims that Soviet military aircraft supposedly brought us Soviet soldiers sometimes.

It must be clear to the students that these claims by the Soviet revisionist authors are in flagrant opposition to historical truty. It is well known that the forces of the Albanian National Liberation Army, although they considered the Red Army a support and correctly evaluated its role in the destruction of the fascist beast, "did not obtain any material, arms supply or clothing from the Soviet Union or from the command of the Yugoslav National Liberation Army, which received consderable assistance of this type from the Soviet Union."[6]

The Soviet Union gave economic and military assistance to the partisan movement in other countries of Europe, such as Poland, Czechoslovakia, Yugoslavia, etc. In this area, the students can also be given figures. Thus, for example, during the war, the Polish Army received from the Soviet Union about 700,000 rifles and automatics, more than 15,000 heavy machine guns and mortars, 3,500 cannons, 1,000 tanks, 1,200 airplanes, etc. During 1944-1945, the Soviet Union gave Yugoslavia a great many weapons. Many of these supplies passed through the Soviet military base established at Bari, in Italy. Understandably, the teachers perceive that with the establishment of this base, possibilities increased for the Soviets to help the struggle of our people, but in reality they gave them nothing in their struggle for freedom.

It must be explained to the students that the reasons for this attitude on the part of the Soviet apparatchiks has been analyzed scientifically by Comrade Enver Hoxha in his major work, "Titistet (Shenime Historike)" [The Titoites (Historical Notes)]. In this work, he shows that the history of the Anti-fascist National Liberation Struggle in our country and that of subsequent years best proves the fact that the Soviets, beginning from the time of the Second World War, have not shown any interest in us. They did not know much about the centuries-old history of our people, which had passed in continual struggles and efforts for freedom and national independence, nor about our National Liberation Struggle. Even the Soviet military mission which came to Albania at the end of the war did not see or understand the greatness and depth of the struggle of our people and party. This means not only that the mission consisted of ordinary people, but also that there was a lack of necessary interest on the part of many Soviet leaders in our struggle. Their true attitude, as is well known, was an anti-Albanian one and it appeared openly after the death of Stalin. As Comrade Enver Hoxha writes, "As may be judged, they were interested in and very well informed about the national liberation struggle of Yugoslavia and must have had more faith in it, at a time when they did not have faith in the Greek National Liberation Struggle, while they did not consider us of any account; they did not know us at all and they defended us because it was necessary for them to maintain their principles. As is well known, the Titoites only informed them very little about us. But this, in fact, pleased them and the Soviet leaders must have reached the practical conclusion: 'Let the Yugoslavs deal with the Albanian partisans'."[7]

With regard to the problem of concrete assistance, Comrade Enver Hoxha, keeping in mind Molotov's declaration that "We give economic assistance for

Albania through Yugsolavia," reached the conclusion: "Since 'Yugoslav assistance' did not amount to anything, we may conclude that Soviet assistance did not exist up to the moment when our relations with Titoite Yugoslavia were broken off."[8]

On the basis of the works of Comrade Enver Hoxha, we refute in a reasoned manner the other claim of the Soviet revisionist historians: that Soviet diplomacy allegedly played a decisive role in saving Albania from the danger of falling under the domination of Anglo-American imperialism during the Second World War. Thus, the authors of a work devoted to the Patriotic War of the Soviet Union write that Albania, without the support of the Soviet Union, would easily have become the object of intervention by the United States and England. This view is also expressed in various revisionist organs and journals.

Students who have become acquainted with the history of the national liberation struggle of our people understand immediately that these claims run counter to historical truth. Comrade Enver Hoxha, in his work "Rreziku Anglo-amerikan per Shqiperine" [The Anglo-American Threat to Albania], proves with many facts that "The party, by its heroic struggle and revolutionary vigilance, saved the people and the fatherland from many dangerous traps which the English pseudo-allies set behind our backs."[9]

On the basis of the work of Comrade Enver Hoxha, the teacher refutes the attacks of the Soviet revisionist historians and reinforces the idea that the Albanian Communist Party and Comrade Enver Hoxha have great historical merit because while they considered the Anglo-Americans as allies against fascism, they did not forget for a moment their class nature, their aims against our struggle, the Soviet Union and the great cause of socialism and communism in the world. They preserved the independence of our country by not submitting to the Anglo-American strategy and the allied Mediterranean command, as did the leaders of the communist parties of Greece, Yugoslavia, Italy, etc.

It is the task of the teacher, by unmasking the aforementioned views of the Soviet revisionist historians on the Anti-Fascist National Liberation Struggle of the Albanian people, to prove in class that in terms of the political and ideological purposes that they attempt to fulfill, they are the same as the view of the bourgeois historians, the Yugoslav revisionist historians, etc. These views are nothing more than an expression of the contempt and denial on the part of representatives of large states for the decisive contribution of a small country and people like ours to the Second World War.

The teacher closes his critique of bourgeois and revisionist views--of Soviet revisionist historiography in our concrete case--in class by describing the great contribution made by our people to this war, the countless sacrifices it made in order to gain the freedom and independence which we enjoy today.

HOXHA'S WORKS AT CENTER OF IDEOLOGICAL EDUCATION

AU091808 Tirana ZERI I POPULLIT in Albanian 1 Feb 86 p 1

[Editorial: "Forms of Education Should Militate More Fruitfully for the Fulfillment of Tasks on All Fronts"]

[Excerpt] Comrade Enver Hoxha's work "On the Party" will be studied this year in the forms of education. This compendium, which has been published in three volumes, includes works by the beloved and unforgettable leader of our party and people that deal with a wide range of problems pertaining to the party, from the time of its founding and up to the present, and highlight, among other things, Comrade Enver Hoxha's valuable contribution to the further enrichment of the Marxist-Leninist doctrine on the party of the working class and its guiding role in the struggle against all the distortions and unscrupulous speculations of the modern revisionists of all hues and molds. The powerful ideas and valuable instructions to be found in the pages of these three volumes will constitute a great inspiration to the communists, cadres, and all the working people of our country to honorably fulfill the considerable tasks set out by the party and synthesized in the nationwide revolutionary movement "Standard-bearers of the Implementation of Comrade Enver Hoxha's Teachings." The party organs and organizations must therefore transform the study of the work "On the Party" into a great ideological action to master Comrade Enver Hoxha's teachings on the party, on its correct and consistent Marxist-Leninist line, on the party's leadership role in all fields of socialist construction and the country's defense, on the principles and norms on which its activity is built, on the qualities that must characterize the communists, and so forth. The party organs and organizations must also carefully scrutinize the advanced experience accumulated in organizing ideological actions and must place it better than ever before in the service of constantly raising the political and ideological standard of the communists, cadres, and the working people.

CARCANI AT SHKODER PARTY ACTIV MEETING

AU131013 Tirana ATA in English 0730 GMT 13 Feb 86

[Text] Tirana, February 13 (ATA)--The meeting of the party activists of the District of Shkoder was convened yesterday. It will discuss some important actions in the field of economy, in implementation of the instructions of the 13th plenum of the Central Committee of the party, which will give a further impetus to the frontal realisation of the tasks this year.

The meeting was attended by cadres of the party and government organs, managers of the economic enterprises and the agricultural enterprises, representatives of the districts' mass organisations, as well as chairmen of the executive committees of the people's council of northern districts and others.

Present was also the member of the Political Bureau of the Central Committee of the party and the chairman of the Council of Ministers, Comrade Adil Carcani.

In his report the chairman of the executive committee of the district people's council, Faik Cinaj pointed out the measures adopted and the work being made to implement the decision of the bureau of the district party committee on the acceleration of the work rates in the project for the irrigation of Shkoder from the lake of Vau i Dejes hydropower station, on the increase of the maize and tobacco production, on the further raising of the number of heads of the smaller cattle and the creation of the herds of which the units of arable land and fruit-growing, etc., will take care. Likewise representatives of the districts emphasized in their contributions the work and actions that have been undertaken to frontally carry out the tasks of this year.

Comrade Adil Caracni, too, took the floor in the meeting. On behalf of the Central Committee of the party and the Council of Ministers and Comrade Ramiz Alia personally, he congratulated the party organisation of Shkoder District, which, as the 13th plenum of the Central Committee of the party instructed, has turned the actions into a method of work for the successful realisation of the tasks of the 1986 plan.

He expressed his conviction that the communists and the working people of Shkoder District, in steel unity round the party and its Central Committee with Comrade Ramiz Alia at the head, will turn 1986 into a year of intensive work and revolutionary actions to realise the set tasks and objectives.

QUALITY OF RECENT LITERATURE EXAMINED BY WRITERS, ARTISTS UNION

Tirana DRITA in Albanian 17 Nov 85 pp 1, 3

[Article: "With Common Concern for Artistic Quality"]

[Text] "What Came out From the Meeting of the Writers and Artists Union?"

The meaning of quality as a matter of artistic content and of achievement in creativity. What is the result of the psychology of coexistence with the average? The advantage of going to the grassroots by writers who work in offices and the danger of transforming the house into an "office." The criticism that flattens literary values promotes averaging and leaves mediocrity in the corner. The writers' critical thought also makes criticism. When you write hundreds of literary pages and do not write 5 to 10 pages of literary criticism. The writer creates the work; but the editor has also his noticeable role in regard to the ideological-artistic level. Sectorial thinking must not be confused with general literary opinion.

The meeting that was held last week at the Writers and Artists Union, showed that the creative people, critics and workers of the printing and artistic (stage sets and motion picture) institutions have a common concern and involvement in regard to solving the concrete tasks stemming from Comrade Ramiz Alia's speech at the meeting with creative workers in Korce. Both in the opening speech by Llazar Siliqi, secretary of the Writers and Artists Union, and in the speeches delivered by comrades Dalan Shapllo, Razi Brahimi, Stavri Kristo, Zoja Cela, Kice Blushi, Dhimiter Shuteriqi and Fatos Arapi, it was stressed that the attention must be concentrated on two main fields: on the continuous and systematic work of the creative workers to improve the level of creativity through involvement in the great problems and concerns of the people, strengthening realism and artistic skills, and on further improving organizational and inspiring work forms in the union, in its sectors and literary organs, in the "Naim Frasheri" publishing house and in other artistic institutions.

The activities of the union and of the writers themselves have a particular importance for new achievements in the struggle against the average and even more against mediocrity. The requirement for a more determined struggle assumes today a special force, because now we have notable achievements, literary works with high artistic and ideological value, which are dear to our people and precious to and esteemed by foreign readers and lovers of art.

Therefore, the higher level of our literature and art and the present stage achieved by our country and readers never accept mediocrity and accommodation to the average. Comrade Ramiz Alia stressed that "culture in Socialist Albania, having a deeply popular character, belongs to all social strata" and "the spiritual and material development must progress parallely." This, therefore, implies the need to improve the qualitative level of our literary creativity in order to respond to the requirements of the time.

When we speak about artistic and ideological quality, it is necessary to have a deep and complete understanding about it, as a matter connected with the problems of content and forms. This was pointed out especially by those who participated in the discussions, because, not infrequently, quality is demanded only in regard to creative skills and artistic forms. Comrade Ramiz Alia pointed out that genuine art bears and expresses the great problems and concerns of the people, reflects the present with profound realism and provides prospects for the future and solutions. This means that the matter of artistic quality must be understood, first of all, as a matter of content. What are the phenomena, problems and subjects that writers grasp from reality? They express the characteristics of life in development, the essential differences and the main concerns of the people. If the problems essential to the life of society and to its struggle for the building of socialism are treated with realism, then, also the artistic forms and means of expression will undergo renovation. However, there is harmony in this relationship when deep knowledge exists and when there is serious and continuing perpetuation and involvement on the part of social and party-minded militants. But, with a superficial knowledge, one can "burn" and artistically compromise important themes and problems. Therefore, it was stressed at the meeting that the process of gaining a deep knowledge of life, through the work forms organized by the union, as it is being carried out this year and, particularly, by the initiators themselves, should be a continuing concern and be converted into a work method and style. It is useful when the union creates opportunities for writers who work in offices to go to the grassroots for 6 months; but, one must be attentive to cases when a writer transforms his house into an "office," that is, making a lukewarm life, a confined life. The knowledge of life, the comprehensive formation of writers and the satisfaction with impressions are not seasonal matters nor are they confined to the construction site or area when you have an idea or a subject that stirs you up. Such a "practice" runs the risk of shallowness and schematism.

On the contrary, when the process of gaining knowledge is continuous and inspiration is also continuous, the "arousal" of essential themes and issues exerts pressure on the creative awareness of the writer. Later on, when the concentration on a determined theme, problem or subject begain, then a more thorough knowledge can be obtained. Precisely at this stage, a certain event and its models assume priority and the writer starts "digging" to a greater depth. It is here that quality often has its roots, because, as it was pointed out at the meeting, the matter of quality is entirely a matter of realism. Average works and, especially mediocre works, first of all, have not realism. Many dramas or novels are lacking the force of realistic reflection; therefore, they have no artistic and ideological quality. Without thorough realistic reflection, you cannot embody in art the essential differences, life conflicts, strong characters with individual qualities, deeply spiritual people and ardent literary speeches.

There was the opinion that many novels published in the past 2 to 3 years are of a satisfactory artistic level; however, all of them are not read by the creative workers and have not been properly monitored by criticism. This opinion must be seen from several aspects. It is true that there are writers who do not continuously read each other's works, just as there are critics who do not regularly monitor the literary process; this must not happen. Also, among the novels published during the past years, there are works of a high level, about which the critics have written and must write more. To present the problem in a general manner and to confuse the failure of certain people to read all novels with the general literary opinion means to judge from a sectorial position and to feed yourself with an empty spoon. The general literary opinion is this: regardless of some achievements, the level of novels published during the past years is still below the requirements of the time. Only by creating with full self-knowledge in regard to achievements and shortcomings, determining and working with great objectives, will our writers and publishers further improve the level of their novels.

Staying with the people, where they work and militate not only gives writers their themes, subjects, and vital prototypes and characters, but also helps them to understand thoughts, tastes and demands of their readers. Standing beside their readers, writers learn what pleases them and what works they call average and mediocre. Because, a reader, when he becomes a friend of the writer, does not speak to him from the rostrum of the "presidium" of the meeting or the conference, but expresses himself with sincerity and makes observations and suggestions which, sometimes, are not covered by professional criticism. From his friend the writer learns that the meaning of average, its level, changes from one literary stage of development to the other. Anyhow, the average will exist, but one must not coexist with it. When aiming at noteworthy literary works, the average level also improves from one stage of development to the other. If you accommodate to the situation of the average todya, tomorrow you may find yourself in mediocrity, because life, the times, social development and readers' tastes progress, increase, and improve. In this understanding, to speak about artistic-ideological quality means to speak about the enrichment of the national cultural works, about the tastes and progress of your people. Therefore, it is essential for every writer to make a critical evaluation of his own work, to be more demanding in regard to his creative results. When the party and general social development demand higher quality in creativity, everyone must think more deeply about his own work, about what he intends to write, about what he is writing or what he has just finished. (As a matter of fact, when he deems it necessary, the author can go to the publisher and ask to review his work, although he has already handed it over.) The attitude of seeking to improve one's work is not simply ethical; it is also the evaluation of the masses of readers and of oneself. The feeling of responsibility for creativity is linked not merely with the "schedule" of the creator's work, but also with its effect on the masses of readers. Comrade Enver Hoxha compared artistic literary works, in regard to usefulness, to the giant hydroelectric power stations, comines and wheat-filled plains. This, however, is an attribute of notable works with a high artistic and ideological level, because, as Comrade Ramiz Alia stressed at his meeting with creative workers in Korce, "without the improvement of the artistic and ideological level, the very educational effect of art is diminished." An average level in creativity and average tastes and demands in publishing and theater productions hinder art and are not encouraging for research work and for improving quality.

In this connection, a more intensive development of litarary criticism, and increased efforts to confront the problems stemming from the literary process, play a special role. Reading the reviews which are published one can see that, in regard to works, there are evaluations and considerations that are repeated in cliche form. In many cases, the authors of these writings are known critics or writers, with individuality. Then, how can you explain this uniformizing attitude? Here, it was said at the meeting, among other things, one can feel the lack of a critical attitude in regard to average values. This is one aspect. The other aspect deals with the tastes of authors of the writings. When it esteems and tries to affirm average values, criticism shows its accommodation to the average in literature. On the other hand, thorough and concrete analyses are demanded, because writings without documentation sound either like praise or like insults.

It was also stressed at the meeting that literary criticism, in general, results from the critical thinking of writers, of those with a long creative experience, but also of young authors who must learn to be always active. The critical opinion of the creative workers has many advantages for writers and for literary development in general. It brings the writer face to face with the times and the work of his colleagues, with the tastes of his readers and with the requirements of contemporary development. Therefore, the participants at the meeting stressed that it is unpardonable for a writer, to write tens or hundreds of pages of literature in a year, and not to bother to write 5 to 10 pages of criticism about a literary issue, about the work of a collague or about the work of a young writer. Especially in regard to the latter, there must not be any lack of concern because this is not only consideration, but also, first of all, concrete assistance.

The attitude toward creativity in the editorial staffs and institutions plays its role in literary artistic development. If editors, stage directors, and scenario writers do not keep in step with the requirements of the times and are not in the forefront of the progressive taste of the masses, then, they pave the way for an average level and, soemtimes, for mediocre works. On the other hand, practice shows that it is harmful to confuse the demands for high ideological and artistic quality with those with aiming at "being within safe limits," not to have trouble, as happens more often in staging theatrical productions. The meeting emphasized that backwardness in dramas and comedies has several causes. Our distinguished writers must get more involved in this field. However, this does not mean that we lack talented authors in this genre or that it is a "difficult" field. (What literary genre does not have its special characteristics and difficulties?) Sometimes, its "difficulty" stems from the many "demands" made through certain links. For this reason, there are cases showing that some creative workers think that it is better to tackle a literary work than to undertake the staging of "Odyssey." This is a restraining concept; we must not tolerate it; it is important, however, to struggle against its causes.

The writer creates literature; outstanding and mediocre works, first of all, are the fruit of his creative work. Distinguished literary works are not written by the best editors and producers. However, their role is always noticeable on the artistic-ideological level. Therefore, it is necessary that the publisher, stage director, and scenario writer be as close to the writer as possible, encourage and help him with their porgressive ideas, tastes, culture, and competent knowledge. In this regard, much still remains to be done.

To implement Comrade Ramiz Alia's guidelines, it is essential to have a broader and more intensive cooperation between the creative workers themselves, between experienced creative workers and talented young men and young women, between the Writers and Artists Union and the institutions and between the cultural and artistic institutions and the union. This cooperation has never been lacking. But, the issue is that it should be more intensive and dymamic, capable of using varied work forms, with living and fruitful activity, so as to successfully fulfill the requirements for ideological-artistic quality.

ALIA ATTENDS CONCERT IN RRESHEN--Tirana, February 11 (ATA)--On occasion of the visit of Comrade Ramiz Alia, the amateur artistic ensemble "Mirdite" gave a festive concert in the house of culture and people's creativeness of the town of Rreshen on February 10. Present were vanguard workers and cooperativists, veterans, heroes of socialist labour, militarymen, youngsters and Enver's Pioneers. Those present welcomed with enthusiastic applause the entering into the hall of Comrade Ramiz Alia. Attending were also the member of the Central Committee of the Party Sofokli Lazri, the first Secretary of the District Party Committee Gjela Biba, the chairman of the Executive Committee of the district people's council Petraq Kalemi and other comrades. The amateur artists sang and danced for the party, Comrade Enver Hoxha, the happy life, the moral beautiful future. At the end of the concert, the amateur artists and all those present in the hall applauded and cheered powerfully for the party, its Central Committee with Comrade Ramiz Alia at the head. PROSPECTS FOR 1986 SUMMARIZED

Prague RUDE PRAVO in Czech 30 Dec 85 p 1

/Article: "With Courage and Energy"/

/Text/ Our society is entering 1986--the year of the 17th Congress and the 65th anniversary of the establishment of the Communist Party of Czechoslovakia --conscious of the magnitude of the tasks necessary to effect maximum continuous future development. Although there will be many opportunities to assess the work accomplished in the last electoral period, our main attention must be focused on the prospects ahead--on the tasks of 1986 and the whole Eighth 5-Year Plan.

It is good to draw encouragement for the work ahead from all that went well in the past; it is right to make use of all experiences that led to success. But it is no less necessary to analyze also the reasons for results that were not as good as expected and find the right approach so that future efforts will be more productive than former efforts. In any case, such a critical procedure is characteristic of the activity of our party in the last 15 years.

In order to provide for the further building of a developed socialist society, the results of the national economy are of paramount importance. They are critical for improving the living standard, enhancing the social security of the people and also for our input into the struggle to maintain and consolidate peace and the unity and strength of the socialist community.

In the coming days the general public will be informed of the main thrust of socioeconomic development in the Eighth 5-Year Plan which will be discussed and approved by the 17th Party Congress. The state plan for 1986 has a special position for achieving the basic aims of the Eighth 5-Year Plan. Its role is to ensure a smooth transition from the Seventh 5-Year Plan to the more demanding terms of the Eighth 5-Year Plan.

An increase of 3.5 percent in the national income is planned for 1986. To realize this it is necessary to make substantially better use of all intensifying factors. The plan to increase generation of the national income is primarily based on further reducing the amount of industrial production for the net national product and accelerating the growth of labor productivity. This means that commercial organizations will have to reduce the costs of materials for output about twice as fast as they did in the last year of the Seventh 5-Year Plan.

With such a requirement, the fact is that in the years 1986-1987 as a result of low growth of assets, the strain in the fuel and energy balance will intensify. Consequently, it will be necessary to give prime attention to more efficient consumption of fuel and energy.

Consistent with the main objectives of the Eighth 5-Year Plan, the 1986 plan places emphasis on more rapid development of the progressive sectors of engineering, the electrotechnical industry and eligible chemistry. The basic requirement is to organize all production in accordance with its intended use, especially for export and the domestic market. In matters of investment, there will be a change in direction, toward the most important aspects of development of the economy in accordance with contemplated structural changes and the course of intensification. The volume of machinery and equipment will increase substantially while the volume of construction work will decline.

To fulfill the tasks planned for the first year of the Eighth 5-Year Plan calls for stepping up the application of R&D results to production especially but also to other areas. It is necessary for R&D to have a much greater impact on the creation of new products and technologies as well as cost effective utilization of raw materials, materials and energy.

In order to intensify the national economy by broad application of the results of R&D, it is essential to make maximum use of international socialist cooperation in the spirit of the Comprehensive Program of R&D Progress of the CEMA Member States to the year 2000 as well as our current bilateral programs with individual socialist countries, especially the Soviet Union. Only in this way is it possible to move ahead rapidly, expediently and efficiently and carry out the prescribed goals of economic development more effectively and reliably than before.

In international socialist cooperation it is essential to develop collaboration, specialization and integration on the basis of direct relations, cooperation not only between departments but also economic production units and their enterprises. By joining forces, making the best use of experience and knowledge we strive to increase technical and commercial parameters and the quality of products.

In 1986 we enter into the Eighth 5-Year Plan. Much depends on it being a successful entry on all fronts and with its high demands influencing all work and results during the entire upcoming period of the 5-year plan. It should, above all, bring about a distinct shift in the quality of all work, specifically in production where quality can be measured and controlled as well as in all other activities where quality depends on personal responsibility and discipline. Every author or collective should be able to sign his work knowing that it was the very best that human power could do.

Only by high quality work is it possible to create the conditions needed to attain the 1986 objectives of raising the living standard. Personal consumption is to rise by 1.9 percent and real personal income by 2.2 percent. Compared with development in the Seventh 5-Year Plan this is a considerably higher growth rate which will characterize the whole period of the Eighth 5-Year Plan. But it must be emphasized again that the given goals can be attained only on the basis of concrete results in the development of production, the creation of high quality goods, intensifying good management in all sectors and consolidating working, technological and financial disciplines.

The year 1986 will be a test of our preparedness to master the tasks of the whole 5-year plan. The tasks--as is apparent even now--are higher and more demanding, and that under more complicated conditions. Therefore it is essential to approach fulfillment of the new tasks with courage and energy, with determination not to retreat before any obstacle, not to evade any problem and not to give way to any weakness or misgivings.

In preparing for the 17th CPCZ Congress party organizations are becoming active and workers' collectives are making numerous pledges on the eve of the congress of the supreme party body. They unanimously express their determination to meet the increased tasks fully and honorably. The party greatly appreciates these expressions of initiative and believes they will develop even further and be directed toward broad and prompt application of the results of R&D to production, toward more efficient use of machinery and equipment, raw materials, materials and energy and toward high quality of work and products.

With courage and energy we enter into 1986, resolved to fulfill the prescribed goals and with new working successes on the eve of the 17th CPCZ Congress!

PLAN FOR CSSR SCHOOL SYSTEM REVIEWED

Prague RUDE PRAVO in Czech 19 Dec 85 p 5

/Article by Miloslav Dockal, candidate member of the CPCZ Central Committee and department head: "Significant Changes in the School System"/

/Excerpts/ At the present time, as the preparations of the communist party and of the entire society for the forthcoming 17th CPCZ Congress reach their peak, out educators are reviewing the fulfillment of the resolutions of the 18th CPCZ Congress and the new tasks facing socialist education. In this connection they are especially aware of the fact that our schools must meet the needs of socialism, serve the interests of the working class and other working people, and actively implement the programmatic goals of the Czechoslovak Communist Party. After all, the entire history of the party and especially of the period of building a developed socialist society after the 14th CPCZ Congress confirms that attention to the growth of the cultural and educational level of the people belonged and still belongs to the most important areas of the policy of the CPCZ and the socialist state.

So far the implementation of the program of the party's school policy has been reflected in a sharp rise in the cultural and educational level of the working people. The introduction of 10-year compulsory schooling for all our pupils has become an important step toward the further democratization of our educational system. This change as well as other changes in our educational system were spelled out in the University Law of 1980 and the law of 1984 concerning the system of basic and secondary schools.

The past period witnessed a positive development in preschool education. Our goal to have 90 percent of preschool children in kindergartens was exceeded by 7 percent. This arrangement has offered beneficial opportunities for the social development of young mothers. Just as important is the fact that in this way our children are better prepared for systematic education in regular schools.

The role and social function of the basic shool has undergone a substantial change. With the introduction of 10-year compulsory school attendance, the basic school is now the fundamental vehicle for preparing all our youth for secondary school, where they receive concrete training for future careers. The new role of the basic school emphasizes the development of the thinking and independence of pupils, the formulation of the scientific world view, and of their relationship with a socialist society, and the formation of their positive attitude toward work and education as important social values.

Also, the changes implemented in all three types of secondary schools are of basic significance. Their intent is_to achieve an overall improvement in the work of academic secondary schools /gymnasiums/, secondary vocational schools, and secondary vocational training centers. These changes broaden the specificity of their mission and at the same time help to bring these three types closer to one another by increasing the academic role of secondary vocational training centers and secondary vocational schools, and at the same time by introducing technical education in the gymnasiums.

Especially significant in this respect is the improved work of the secondary vocational training centers. The modern understanding of the training of young workers justifiably emphasizes the general academic aspect and its more appropriate role in vocational training, and the more effective linkage between theoretical preparation and vocational training--in other words, the ability to acquire technical abilities and skills. Understood in this manner, the training of future workers conforms fully to the political role of the working class in a socialist society and the corresponding necessity of active participation by its future members in political and public life.

The past period saw the extension of the length of study and the modernization of its content at our universities. The purpose of this step has been to secure the training of highly qualified cadres with a relatively broad technical background in a given area. Emphasis is given to creative attitudes and the higher adaptability of graduates to the present and future needs of social practice.

Adult education has become an integral part of our educational system. Its goal is the upgrading of skills acquired in the past, greater specialization, or retraining.

During the Seventh 5-Year Plan, we continued primarily to build preschool facilities and basic schools, especially within the framework of our extensive construction program. At the same time, however, the building of other types of schools and school facilities was also done on a large scale. In the course of the past 5-year plan, the national committees spent Kcs 9.5 billion to build educational facilities. This money paid for the completion of 1,600 schools with 7,500 classrooms and 2,000 beds in youth hostels. In addition, we made 173 additions to the existing schools buildings valued at Kcs 750 million. We invested Kcs 2.25 billion in the universities. In this way, our universities acquired 87,000 square meters of new classrooms and laboratories, the necessary space for more student cafeterias for the additional 5,700 meals and 12,300 beds in the dormitories. The latter provide lodging for over 121,000 students which, for all practical purposes, satisfies all student demands for space in the dormitories.

From a number of comments which were made it is obvious that certain people involved in social activity have not yet accepted the idea that at any given level of social development it is still not possible to think that the training of the graduate is completed at the moment he is presented with a diploma or other certificate attesting to his graduation.

It is imperative that the schools' efforts be followed up by the necessary attention of the ministries and individual organizations and institutions which must help to improve the qualifications of young workers, technicians, engineers, and other experts. The modern concept of a life-long education is, after all, not a mere theoretical thesis but a necessity.

This will not reduce but, on the contrary, increase the demand for the improved education and social responsibility of school graduates, their creative thinking, activity and initiative. Consequently, one cannot accept the fact that certain graduates of our secondary schools and universities look for their personal and professional fulfillment in mediocre and routine jobs, in the comfort of a godforsaken office, that they are afraid of difficulties and challenges which they must overcome, and that they do not care to work in demanding positions of our socialist construction. To discover the new laws of science, to experience the adventure of learning, to undertake conclusive creative effort in some seclusion and static comfort is and will remain difficult if not outright impossible.

The building of socialism, the linking of its advantages with the achievements of scientific-technical progress require from each and every worker sacrifice and courage, professional mastery and political awareness, a great deal of creativity but also a sense of collective work, humility and honesty. Only people with these characteristics can and will perform great deeds and achieve significant results.

Our schools, their teachers and other workers play a decisive role in the education of young people. The basic demand on a socialist teacher is his responsibility for the results of his work. This responsibility will grow with the further development of our school system.

The successful fulfillment of the tasks of the party's school policy depends to a decisive extent on the success of improving the effectiveness of communist education in the school and on the joint effort and cooperation of all social functionaries. The Marxist-Leninist world view of young people, their attitude toward their homeland and their international attitude, their attitude toward work and socialist ownership, and their moral and esthetic values and norms do not happen causually. Rather, they are formed gradually under the concrete conditions of life and work. The significance of the above is exemplified by adults.

Because of the above reasons neither the school and its personnel, nor the family, the national committees, the social organs and the organizations of the National Front, especially the Socialist Youth Union and its Pioneer organization, can remain indifferent to the problems which we face in the education of the new generation. The way to improve the system of education, to increase ideological and political awareness, the social activity and involvement of pupils and students is not only a theoretical but also a practical question.

For this reason it is necessary that every person, regardless of whether he works directly with young people or only influences them indirectly, must contribute to the uniform education of the future generation.

The acceleration of scientific-technical development under the conditions of socialist construction increases the demands on our entire school system. It means caring about improvement in the teaching of the modern math, natural sciences and technology; about applying the results of cybernetics, robotics, biotechnology and other progressive fields in the training of future workers, technicians, engineers and other specialists. To achieve a high effectiveness in this respect calls for making the scientific-technical revolution the real substance and work of the socialist school. It is necessary not only to reach electronics and computer technology but also to see to it that this and other areas of scientific-technical progress become the actual focus of the school activity of pupils, students, and teachers.

We are now witnessing the completion of the complex program of computer literacy in our educational system. After the appropriate discussions and approval by the governments, this will become a basis for the accelerated solution to these questions in schools and educational facilities.

In order to realize this goal, it is indispensable that we have enough computers, audio-visual aids and work programs; we also must in time train the necessary teachers. The basic training of teachers for work with computer technology is already being realized in diversified training courses.

Not even in the forthcoming Eighth 5-Year Plan can our school system do without further investments to secure the development of the material-technical base of education. Priority will be given to building all types of secondary schools, including youth hostels which will house the numerically large classes in the 1986-1990 period. Especially, the pertinent ministries must create more favorable conditions for the planned development of secondary training centers and more consistently pay attention to increase space which still lags behind our needs. In connection with the introduction of the 10-year compulsory school attendance it will help the construction of secondary vocational schools and gymnasiums if they will be viewed as part of civic needs within the framework of the construction of housing developments.

The development of the basic school system will aim at the construction of specialized workshops and classrooms. As far as the kindergartens are concerned, during the Eighth 5-Year Plan we will consider in most cases only replacements for outdated facilities. Special attention, however, must be given to further construction of schools in the countryside, children's homes, youth hostels as well as the network of arts schools and schools for youth requiring special care.

As far as the universities are concerned, our investment policy will concentrate on the improvement and expansion of the space needed for instruction, science and education, and on the completion of the network of school cafeterias and dormitories. Our basic target is to accommodate approximately 80 percent of the students in the dormitories by the year 2000 except in Prague and Bratislava, where the needs are lower.

By its increased attention to the solution of all pressing educational, cadre, organizational as well as material-technical questions, our communist party will systematically try to improve our entire school system with an eye on needs to accelerate the socioeconomic development of our society.

RCP'S STOIAN MEETS WITH CRAXI, OTHERS DURING ROME VISIT

Talks With Craxi

AU312104 Bucharest Domestic Service in Romanian 2000 GMT 31 Jan 86

[Text] On behalf of Comrade Nicolae Ceausescu, RCP secretary general and president of the SR of Romania, warm greetings and best wishes were extended to Bettino Craxi, secretary general of the Italian Socialist Party and chairman of the Council of Ministers of Italy, as well as wishes for success and prosperity to the Italian people.

Bettino Craxi expressed thanks and asked the Romanian guest to convey cordial greetings to Comrade Nicolae Ceausescu, as well as wishes for new successes and the expression of his special consideration.

The exchange of messages took place when Prime Minister Bettino Craxi received Comrade Ion Stoian, candidate member of the Political Executive Committee and secretary of the RCP Central Committee, who is visiting Italy.

The two sides exchanged views on the development of relations between the two parties, cooperation at various levels between Romania and Italy, and on certain aspects of the current international situation. Within this framework, the two sides expressed their desire to continue to develop relations between the RCP and the Italian Socialist Party and between Romania and Italy. Special attention was paid to expanding trade exchanges and economic cooperation between the two countries, and the broad opportunities offered by the economies of both countries were stressed.

Discussing certain aspects of the international situation, the two sides emphasized that the basic problem of our time is halting the arms race and proceeding to disarmament, primarily nuclear disarmament, and stressed the need to unite efforts of progressive and democratic forces, governments, and peoples for this purpose.

The RCP delegation led by Comrade Ion Stoian, which is visiting Italy at the invitation of the PCI, also had talks with Paulo Bufalini, member of the directorate of the PCI and chairman of the Central Auditing Commission; Gian Carlo Pajetta, member of the directorate and secretariat of the party

Central Committee; Luciano Magri, member of the party directorate; and Antonia Rubbi, member of the party Central Committee and chief of the foreign relations section.

The Romanian delegation also met with the leadership of the Gramsci Institute and of the Study Center for International Policy and paid a visit to the Federation of the PCI in Rome.

During the visit and talks, the two sides briefed each other on the activity and concerns of the two parties. Special attention was paid to certain aspects of the current international situation and of the communist and workers movement. The sides stressed the desire of both parties to intensify contacts and to develop ties in the interest of the two parties, countries, and peoples.

Meeting With PCI Leader Natta

AU011728 Bucharest AGERPRES in English 1630 GMT 1 Feb 86

[Text] Rome, AGERPRES 1/2/1986--Alessandro Natta, general secretary of the Italian Communist Party, received a delegation of the Romanian Communist Party headed by Ion Stoian, alternate member of the Executive Political Committee, secretary of the CC of the RCP.

From Nicolae Ceausescu, RCP general secretary, a warm salute and best wishes of good health and success were conveyed to the general secretary of the Italian Communist Party, Alessandro Natta, and wishes of new achievements in the party's activity.

Alessandro Natta thanked for the message and asked that Nicolae Ceausescu be conveyed a cordial salute and best wishes of good health and personal happiness from himself and the direction of the Italian Communist Party.

During the talks, both sides expressed satisfaction at the growing evolution of the relations of friendship, collaboration and solidarity between the RCP and the PCI. Stress was laid on the joint resolve to intensify and expand more these relations, on the basis of mutual esteem and respect, of full equality, in the interests of the two peoples, of the friendship between Romania and Italy, of the general cause of social progress, of socialism, detente, security and peace the world over.

Information was exchanged on the situation in the two countries, on the current and long-term concerns and targets of the two parties.

The exchnage of views on the international situation evinced the two parties' identical or similar positions on the major problems of the evolution of the comtemporary world, of the struggle for detente, disarmament, nuclear disarmament in the first place, for the ensurance of peoples' right to existence, peace and life.

Received by Spadolini, Others

AU011733 Bucharest AGERPRES in English 1638 GMT 1 Feb 86

[Text] Rome, AGERPRES 1/2/1986--Giovannia Spadolini, secretary-general of the Republican Party of Italy [PRI], received Ion Stoian, alternate member of the Executive Political Committee, secretary of the CC of the RCP. On the occasion from Nicolae Ceausescu, RCP general secretary, president of Romania, a message of cordial salute was conveyed to the secretary-general of the Republican Party of Italy.

Giovanni Spadolini thanked and asked that Nicolae Ceausescu be conveyed a cordial salute.

During the talks aspects were approached related to the current activity and concern of the two parties, as well as problems of the international life.

Stress was laid on the evolution of the fine relations of friendship and collaboration and the RCP and the PRI and the wish was expressed to work for the intensification of their links and of the Romanian-Italian relations in policy, economy, technics and science, culture and other fields of activity.

Giorgio la Malfa, deputy secretary-general of the PRI, chairman of the Foreign Policy Commission of the Chamber of Deputies of Italy, attended the interview and talks.

While in Italy, the RCP delegation headed by Ion Stoian, alternate member of the Executive Political Committee, secretary of the CC of the RCP, also met and conducted talks with Senator Fabio Fabbri and Deputy Angelo Cresco, members of the Directionate of the Italian Socialist Party, and Filippo Fiandrotti, secretary of the Chamber of Deputies.

CEAUSESCU RECEIVES NORWEGIAN AMBASSADOR'S CREDENTIALS

AU311641 Bucharest AGERPRES in English 1530 GMT 31 Jan 86

[Text] Bucharest AGERPRES 31/1/1986--January 31, President Nicolae Ceausescu of Romania received Knut Erling Sagen, who presented his credentials as ambassador extraordinary and plenipotentiary of Norway to Romania.

Handing over the credentials, the ambassador conveyed President Nicolae Ceausescu choice greetings from his Majesty Kong Olav V of Norway.

In the ambassador's address stress is laid on the Norwegian Government's satisfaction at the evolution of the relations between Norway and Romania, as well as on its resolve to further work for the continuous strengthening of these relations for the development of the Norwegian-Romanian cooperation in domains of common interest. Emphasis is also placed on the decisive importance of the official visit paid by Romania's president to Norway in 1980 for the development of fine relationships between the two countries.

On receiving the credentials President Nicolae Ceausescu thanked for the feelings expressed and also conveyed cordial wishes to the King of Norway, and wishes of progress and prosperity to the friendly Norwegian people.

In the Romanian head of state's address of reply the positive evolution of the relations of friendship and collaboration between Romania and Norway is assessed in the positive and it is stressed that Romania attaches special importance to the development of the Romanian-Norwegian collaboration and cooperation, in keeping with the two countries' economic potential, which allows for a more marked increase of economic, technico-scientific and cultural exchanges and exchanges in other domains. Fine conditions are shown to exist for Romania and Norway, two Euorpean countries, to develop a fruitful cooperation at the Stockholm Conference and at the UN for the settlement of the major issues confronting our continent, for understanding, security and peace the world over.

Stress is also laid in the address on Romania's resolve to steadily work for the promotion of cooperation and security in Europe, for the development of a broad cooperation internationally, without obstacles and discriminations, for the eradication of underdevelopment and the building of a new world economic order, for the achievement of disarmament, for the safeguarding of security, cooperation, and peace throughout the world.

CEAUSESCU RECEIVES ECUADORAN AMBASSADOR'S CREDENTIALS

AU311618 Bucharest AGERPRES in English 1525 GMT 31 Jan 86

[Text] Bucharest AGERPRES 31/1/1986--President Nicolae Ceausescu received on Friday, January 31, Filoted Samaniego Salazar, who presented his credentials as ambassador extraordinary and plenipotentiary of the Republic of Ecuador to Romania.

Handing over his credentials the ambassador conveyed Nicolae Ceausescu the cordial salute of the president of the Republic of Ecuador, Leon Febres Cordero Ribadeneyra, and the Romanian people wishes of progress and welfare.

In his address, the ambassador highlighted the fine links between Romania and Ecuador and expressed the wish to further develop the cooperation between the two countries in various areas of activity, as well as Ecuador's concern to cooperate closely with Romania on an internal [as received] plane.

Receiving the letters of credence, President Nicolae Ceausescu thanked for the message and conveyed the president of Ecuador a warm salute.

In his address, the Romanian head of state highlighted the wish to expand and diversity bilateral cooperation between Romania and Ecuador--economically, politically and in other fields of mutual interest--starting from the existing favorable conditions, to further work for the implemenetation of the understandings reached during the Romanian-Ecuadoran summits, of the provisions of the bilateral documents in force.

Socialist Romania, he said, is deeply interested in developing broad collaboration and cooperation with all the states of the world in the fight for progress and peace. In this framework, Romania works for the strengthening of friendship and collaboration with the Latin American countries, with the developing and non-aligned countries. The Romanian head of state also showed [as received] that the fundamental questions of the international life were the cessation of the arms race and the achievement of a passage to disarmament, to nuclear disarmament in the first place, and stressed that everything possible should be done to prevent a nuclear disaster, to safeguard the people's foremost right to life, peace, free and dignified existence.

DECREE ON WEAPONS, AMMUNITION AMENDED, SUPPLEMENTED

Bucharest BULETINUL OFICIAL in Romanian Part I No 4, 21 Jan 86 p 2

[Council of State Decree Amending and Supplementing Decree No 367/1971 on the Handling of Weapons, Ammunition and Explosive Materials]

[Text] The Council of State of the Socialist Republic of Romania decrees:

Article I--Decree No 367/1971 on the handling of weapons, ammunition and explosive materials, republished in BULETINUL OFICIAL Part I No 21 of 8 March 1976, is amended and supplemented as follows:

1. Letter e^1), with the following content, is inserted in Article 2 after letter e):

"e^1) prop weapons, which are firearms which have been transformed or adapted so that they can be used only with blank ammunition, which are intended for use in the artistic and production activity of the "Bucuresti" Cinematographic Production Center, the Bucharest State Circus and the theaters."

2. Article 17, letter d) will have the following context:

"d) is in the situation described in Article 32, paragraph 3;"

3. Article 24, paragraph 2 will have the following content:

"The Romanian Shooting Federation and the Economic Enterprise for the Management of Bucharest Sports Grounds can organize, with the approval of the National Council for Physical Education and Sports, familiarization courses or training courses in various types of marksmanship; such as air rifle, bullet, trap, skeet, wild game and live pigeon shooting, for foreigners who are in the Socialist Republic of Romania, with payment in hard currency, as well as for Romanian citizens, with payment in lei."

4. Article 26 will have the following content:

"Article 26--Cultural and art institutions, as well as cultural-artistic and sports associations, can have panoply weapons in their possession which they are obliged to register with the militia organs.

The "Bucuresti" Cinematographic Production Center, the Bucharest State Circus and the theaters can possess and use prop weapons which they are obliged to register with the militia organs.

The necessary prop weapons can be obtained from the Ministry of National Defense and the Ministry of the Interior, from the supply of weapons which are no longer in use. The necessary blank ammunition can be obtained from the producing enterprises and from the Ministry of National Defense and the Ministry of the Interior.

The possession of panoply weapons which are in operating condition or of prop weapons by the socialist organizations specified in paragraphs 1 and 2 is permitted only on the basis of an authorization which is issued by the Bucharest Municipality militia or by the militia of the country in whose territorial jurisdiction these organizations have their headquarters, under the conditions stated in AVticle 10 which are applied appropriately."

5. Article 32, paragraph 3 will have the following content:

"The persons specified in paragraph 1 must hand over their pistols to the appropriate organs when they become members of the reserve or when they retire."

6. Paragraphs 4 and 5 of Article 32 are abrogated.

7. Article 54 is supplemented by a new paragraph with the following content:

"Weapons belonging to the Romanian Shooting Federation and to sports clubs and associations with marksmanship sections, which are no longer used for competition, can be used by individuals and juridical entities which have a right to possess them, with the exception of weapons with 5.6 mm caliber bullets which can be used only by authorized juridical entities."

Article II--Within 30 days of the application of this decree, the General Inspectorate of the Militia will draw up norms for its application, which will be approved by the minister of the interior.

TRANSPORTATION NORMALIZING AFTER SNOWFALLS--Bucharest, AGERPRES 4/2/1986--Things went back to normal in the wake of the steps taken in the southern and eastern parts of Romania that have been under heavy snowfalls in the last few days. At present, railroads and railway installations are no longer affected by weather conditions. As for road traffic, it is disrupted on several national road sections in the southern part of the country. Traffic is difficult on a number of roads in southern Muntenia and Oltenia. First-lane two-way traffic is possible on the Bucharest-Pitesti motorway. Operations are in full progress to clear the roads that were closed to traffic. Freight and passenger road transport is affected in several counties in Muntenia and Oltenia. Activites are carried on in normal conditions in all the Romanian Danubian ports, with the exception of the ports at Bazias, Moldova Veche, and Svinita, where activity is hindered by a rough wind. The situation went back to normal in the port of Constanta. All airports are opened to traffic. Postal and telecommunications installations operate normally. CASTRO'S THANKS FOR ANNIVERSARY MESSAGE--To Comrade Nicolae Ceausescu, RCP secretary general and president of the SR of Romania. On behalf of our people, of the Communist Party and the Government of the Republic of Cuba, I send you most sincere thanks for the fraternal message of greetings you sent us on the occasion of the 27th anniversary of the victory of the Cuban revolution. Fidel Castro Ruz, first secretary of the Central Committee of the Communist Party of Cuba and president of the Council of State and of the Government of the Republic of Cuba. [Text] [Bucharest SCINTEIA in Romanian 26 Jan 86 p 7 AU] /6662

JAPANESE CP LEADERS 'THANKYOU'--To Comrade Nicolae Ceausescu, RCP secretary general. Dear Comrade, We thank you for the cordial greetings you sent to us on the occasion of our election by the first plenary session of the 27th congress in the functions of chairman of the Central Committee and of the chairman of the Presidium of the Central Committee of the Japanese Communist Party. We wish you full health and success in your activity. With communist greeting, Cenji Miyamoto, chairman of the Central Committee; Tetsuzo Fuwa, chairman of the Presidium. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

GERMAN DEMOCRATIC REPUBLIC

INCREASED REPROCESSING REDUCES INDUSTRY'S FRESH WATER DEMAND

East Berlin TECHNISCHE GEMEINSCHAFT in German Vol 33 No 11, Nov 85 (Signed to press 14 Oct 85) pp 3-4

[Article by Rudolf Miehlke, engineer, member of the presidium of the Chamber of Technology [KOI], chairman of the KDT association on water: "The resource important to life"]

[Text] The Directive of the Politburo of the Central Committee of the SED and the Ministerial Council of July 21, 1984, on the rational water use during the period of the five-year plan from 1986 to 1990 states that for the further realization of the economic strategy of the SED for the 1980's in water management the further heightening of the intensification is required. The Directive names as the main road towards this the goal-oriented, rational use of water. It is the principal area for creative ideas and initiatives and an important crucial point of labor for the deserving preparation of the 11th Party Congress of the SED.

The constantly growing and long-term demands for a quality oriented and stable drinking water supply for the populace, water processing systems necessary to ensure a high rate of growth of production and for further intensification in agriculture, as well as improvement of the natural environmental conditions require everywhere the rational use of water. They require rational water use, increased protection of ground and surface water from pollution with aqueous toxic substances, intensive effluent treatment, and accelerated the recovery of valuable substances. The constant increase in performance and efficiency of the water management plants and installations is necessary for all branches of the economy.

In this sense the political-ideological efforts of our leaders is important. It is important to explain that the great importance of rational water utilization, and of a method of water protection inseparably connected with this, is derived on the one hand from requisites of the economic strategy of the SED and on the other from the status of water utilization reached at the beginning of the 1980's in the GDR.

Rational water use and (environmental) water protection are inseparably connected with the main objective and fixed component of the economic strategy of the Party of the Working Class. The Water Law passed in July 1982 by the People's Chamber takes into account these requirements.

The results so far from the carrying out of rational water use during the years 1981 to 1984 show that these efforts are rewarding. That was also made clear by the seminars on rational water use held during the third quarter of 1985 in all districts.

Thus, for example, in the economy instead of the predicted rise in water use of an annual one percent, an absolute reduction of 1.4 percent was successfully achieved, including even 5.7 percent in industry. The specific water demand was reduced by about 19 percent.

Less Drinking Water for Production

The combines and plants of industry can display additional advances with reduction in withdrawal of drinking water from the public water system for production purposes. By the end of 1984, 32 million cubic meters had been used, or six percent less drinking water than in 1981. The quantity was consumed mainly by the drinking water needs of the populace. The drinking water consumption by the populace rose 13 percent. In 1984, water amounted to an average of 133 liter per person daily.

It was possible to reduce water pollution, while effluent loading with organic substances dropped by about 10 percent. With this, the conditions for the multiple use of water were improved.

Water supply for irrigation was increased by about 20 percent. At that time this comes to 17 percent of the available water supply in a drought year.

Rational use of water and better treatment of effluent make it possible to provide for the rising needs of the populace and agriculture, with significantly little expenditure. Accordingly, 4.9 billion marks in investments and 390 million kWh of electrical energy were saved. The result of this is sinking operating costs.

Where rational water use is consumed, those collectives are exemplary that strive for the honorary title "Ideally Working Plant (or Combine) in Water Management" in industry and agriculture. In 1985 honorary certificates and prizes were awarded to 143 such collectives in all branches of the economy.

The results show that, with this motivation, large reserves would be released in our republic. In this manner, specific water demand sank by about an average of 30 to 60 percent and absolute water consumption by 51 million cubic meters. The withdrawal of drinking water from the public water supply for industrial purposes could be reduced by almost 9 million m^3. Beyond that plants made available from their own installations almost 14 million m^3 drinking water annually for the central supply. From the effluents valuable substances at a value of over 33 million marks annually were recovered including above all lead, copper, and silver, as well as fibers, fats, oils, whey, yeast, and grains.

KDT Decisively Involved as a Unit

The members and collectives of the KDT cooperate actively on numerous KDT objectives and other initiatives in this economically important movement. Thus, the technical subcommittee on water management in light industry with the results from the KDT objective in the VEB Leather Works Weida has contributed to the fact that it could be started a year earlier with investment preparations. With the proposed process the reduction of the organic loading in the effluents by 60 percent and the sulfide content by 99 percent was successful as well as the recovery of fat/albumen by 71 percent and chromium compounds by 90 percent.

Beyond this, the technical subcommittee became involved in the VEB Oberlausitzer Textile Plant and the VEB Neukircher Leather Factory with the establishment of a water management laboratory as well as provided intensively consultation on the solution to effluent problems to the plants VEB Trikotex Wittgensdorf, VEB Two-Cylinder Spinning Mill, VEB Bright Dye Works Limbach-Oberfrohna, and VEB Bandex Steina.

But also other collectives show, with their initiatives, a mature consciousness. The KDT active of the Combine Sugar has developed great activities toward the utilization of intermediates and waste products of sugar refining for a biotechnical use. Through the collaboration of the industrial sections of the Institute for Research and Rationalization for the Sugar Industry and the Sugar Factory Haldensleben a process for the anaerobic treatment of highly polluted effluents was worked out as well as a large scale pilot plant was prepared. In connection with this, there has been a significant reduction of processing water consumption in sugar factories and a significant increase (up to 80 to 90 percent) in the degradation capacity for organics with the lowest processing costs. The gains, that are achieved with the large scale pilot plant, come to 328,000 marks.

Great efforts are becoming visible in other areas too. The Non-Alcoholic Refreshing Drinks Co. and the Technical Subcommittee for Water Management in the Food Industry are instituting in cooperation the recovery of valuable substances at the bottle washing machines of the MDG construction series. The process already used in breweries of liquor circulation makes possible through the recovery of valuable substances an effluent clean up and the elimination of investment for effluent treatment installations.

During a seminar in May of this year the data from the large scale experiments in the VEB Municipal Brewery Olbernhau were evaluated, solutions for the in-house reuse of rinse water from bottle washing machines, e.g. as boiler feed water and industrial use water, were presented, as well as information was presented on the bottle washing program of the VEB Machine and Steam Boiler Construction Gera, which contributes to water and energy savings. These are data which the recommendation of the research Association for Water should suggest to the FV/WTG [Research Association/Scientific-Technical Society] areas of water use for the inclusion of the rational water use in its branch specific endeavors.

The Technical Association for Water is constantly striving to take into account with its arrangements for further education the great economical desire for rational water use.

Accordingly, the 15th Effluent Technology Seminar on the subject of "Effluent Treatment and Recovery of Valuable Substances - Decisive Components of the Rational Water Purification" that was carried out in cooperation with BV Gera, was used in order to present new, more advanced technologies from various water using areas of the economy and recovery processes. The seminar confirmed the flotation process, adsorption process, as well as the emulsion calculation as equally promising and multivalently applicable efluent purification principles. With flotation considerable, efficiency in the recovery of valuable substances can be achieved.

AUTOMATION INITIATES COMPREHENSIVE INDUSTRIAL, SOCIAL CHANGE

East Berlin WIRTSCHAFTSWISSENSCHAFT in German Vol 33 No 10, Oct 85 pp 1467-85

[Article by Werner Huebner, Dr of Economics, Certified (Industrial) Engineer, born 1938, scientific assistant with the Central Institute for Economics, GDR Academy of Sciences; and by Peter Straehmel, Dr of Economics, Certified Economist for (Industrial) Engineering, scientific assistant with the same institute. Original title: "Automation--A Basic Factor of Comprehensive Intensification".]

[Text] At the ninth SED Central Committee session Erich Honecker pointed out that "the time has come to make a decision that takes our thoughts on our country's development up to 1990, even up to the threshold to the year 2000."[1]

For the future economic development up to 1990 and beyond it is important to get much out of those factors especially that ensure over the long run, stably and irreversibly, the process of intensively expanded socialist reproduction. That was emphatically endorsed at the 10th SED Central Committee session. The sources and substance of growth are changing during comprehensive intensification while they in their specific ways and means determine the course and tempo of expanded reproduction.[2]

Among the long-term stable factors of comprehensive intensification undoubtedly is the automation of production and labor. Of it one rightly expects for now and the years ahead strong impulses on our society's economic and social development. Theoretical and practical generatlizations on the essential substance of automation, its revolutionary function in the system of the productive forces, the main trends and stages of its development, and the consequence and scope of its effects on socioeconomic development are important and necessary tasks in economic science research. They ensure the necessary leads in insight to guarantee a high efficiency and performance growth and the enforcing of socioeconomic aspects under the conditions of comprehensive intensively expanded reproduction.

Economic science literature has often presented research results and discussed *basic problems on the substance and developmental trends of automation* and its socioeconomic effects.[3] Many questions of the social application and development of automation call for more of a clarification still, however, from the political-economic point of view. That includes above all more penetrating knowledge on the further development of automation as dependent on the production goal, the overall economic framework conditions, the scientific-technical innovations, and the socioeconomic conditions; the substantive characteristics of automation and its effects from the social point of view; and problems of the social planning and management for the economic spread of automation. Surveys on these sets of problems are of great importance right now because, for one thing, none but microelectronics facilitates a fundamentally new and qualitatively higher level of automation yet, on the other hand, none but the total effects of this new quality can properly characterize the role and position of automation in comprehensive intensification. The following remarks intend to comment on some of the technical-economic and the socioeconomic aspects.

Microelectronics--Basis for a New Quality of Automation

The technical status of testing, control and regulating techniques thus far largely controlled the developmental level of automation. Mechanical, hydraulic, pneumatic, electrical, and electromagnetic control and regulatory mechanisms would for a long time constitute the essential components of automation technology. It had a harshly confined capacity for the data collecting, storage, transmission, and processing in the production process. It was hardly possible to carry on any complex information exchange, let alone an automatic overall handling of the various parts of the system. The data processing side of automated production processes lagged far behind the other two components, energy and material conversion, in its technical-economic development and ultimately became a constraint to the further development of the process techniques. A high degree of automation attainable in production was correlated with relatively rigid production procedures in mass production, primarily in energy and operational techniques. While traditional automation techniques had initially paved the way for modern synthetic chemistry and the output in power plants and in metallurgical enterprises and in the mass production of the processing industry, already in the 1960's these techniques showed the tendency of putting a brake on increasing the rate of the process, optimal process operation, a qualitative and quantitative increase in the production volumes while keeping even or reducing energy and raw material investments, on the technical-technological utilization of microstructural natural processes and the coping with the management and control efforts, rising due to constantly greater complexity, the effort, that is to say, information called for. Sectors with high data processing requirements, such as the nonproducing sectors and the sectors outside of production itself (R&D, planning and management) as well as the production branches in small and medium-size series production could hardly raise their productivity and efficiency levels by means of these automation techniques. Nor did the use of ADP in the 1960's change that substantially because, for one thing, a spread of the data processing side could technically be realized but incompletely, because of lacking decentralized (spatially distributed) and hierarchically structured systems, for example. On the other hand, these techniques precisely were too susceptible to interference and called for high function-specific economic expenditures. In the late 1960's the GDR developed systems to improve productivity and efficiency in the metal-processing industry. That included the streamlined technical production preparation automation system (AUTEVO) with its part component of automating mental work in the range of that technology (AUTOTECH) and in design/project planning (AUTOKONT/AUTOPROJEKT) and the setting up of centralized production facilities for making individual parts and components. All these systems, however, could not be effectively enforced over the broad economic scale at the time by means of the automation techniques then available.

The transition to comprehensive intensively expanded socialist reproduction calls for surmounting such inhibiting factors.

Through the development of microelectronics the prerequisites have been and are being laid forsurmounting the inhibiting factors of "traditional" automation step by step. It is clearly apparent that this process goes very fast and the limits of that development still are not foreseeable. Microelectronics, however, not only makes possible a new qualitative automation level, it mainly also creates the conditions for shortening the thus far still more or less lengthy historic process from the simple technification of more and more fields of work down to their automation. Important here is the possibility to leap over specific distinct technification levels, of the "division of labor, which already transforms the workers' operations more and more into mechanical ones, so that at a certain point the mechanism can take over for them,"[4] as it was typical of the development of big industry. Microelectronic automation technique makes possible achieving the technification of human labor operations in larger complexes and on a higher technical level from the outset, without having to use successively technical, mechanical, or partly automated working tools for each part of the labor.

The technical-economic potentials of microelectronics cause a penetrating, qualitative and quantitative, upward development of automation technique, especially by the following effective influences:

First, through microelectronics new automation technique elements are tapped, especially for collecting, storing, processing, and transmitting complex data. Of elemental importance to it are the microprocessors which, with their extra microelectronic components like program storage, data and labor storage, and input and output units, form the core of the future automation techniques. Microporcessors and storage units form the basis, for one thing, for the needed transition from the central to the decentralized control over machines and installations and, on the other hand, for the combination of central and decentralized controls into control or computer hierarchies. Even by directly integrating computer and ADP technology, the technical means of automation attain a new quality.

Second, the use of microelectronics on the one side leads to increasing substitution and, on the other, to a technical integration of the conventional testing, control, and regulatory techniques. Electronics' entering the process sequences, the control and regulation of processes under real time operations, calls for a broad spectrum of microelectronic elements to gather and process information. Of special importance here are relevant microelectronic sensors which, coupled with microcomputers, can e.g. collect, convert, analyze, store, and process physical entities like pressure, vibrations (sound, that is, even language in the future), heat, magnetic fields, beams, directly and in small units. The further growing performance potential of microelectronics in connection with other innovations directly initiated by it (such as the condenser relay techniques) also raises the elements of the testing, control and regulatory techniques onto a completely new qualitative level.

Third, microelectronics forms the foundation for pervasive changes in the information infrastructure through the development of new media, new transmission and communications systems, and local, regional, and international networks. The formation and fusion of some partial areas in the information and communications systems and their close link with the material production processes will significantly lead to a higher social complexity and flexibility of automation solutions. From control and regulatory electronics, from computer-aided design and processing systems, and from others, data (language, text, picture, data through possible conversions from analogue into digital signals and vice versa) can be made available at virtually any quantum, at any time and anywhere. Especially the chances for controlling central and decentralized operational and territorial streams of information, i.e. of the complex multivalent use of data once received, lead to an extremely strong reduction of the thus far economically advantageous automation threshold. The scope of the effectively automatible functions of the reproduction process increases enormously.

Fourth, introducing microelectronics leads to the formation of two basic and relatively independent components of automation technique, the hardware and the software. As an indispensable component of the means of automation, software is an element of working tools completely new in quality. "Hardware cuts short and intensifies the processes through its working speed and synchronizes the various processes, but the qualitative changes of the labor processes and their control goes via the software."[5]

For the quality of automation solutions both elements are of elemental importance. Qualitatively and quantitatively inadequate software can bring it about that the possible performance potential of the entire automation system fails to become fully effective, so that possibly efficiency losses arise in time sharing and the energy and raw material use and quality deficiencies in the products. Software thus significantly controls the tapping of the hardware's efficiency potential, provided of course that an efficient and constantly operational hardware is in place. Technically inadequate hardware cannot be substituted for by anything, not even by the best software. The latter also always depends on the technical-economic potential of the hardware. Important though for controlling automation solutions is that with the increasing efficiency and increasing degree of integration in the application systems the qualitative and quantitative demands made on the development and maintenance of the software mount drastically in part. Gilde, for instance, says about using robots: "A widespread error is the belief that electronics (Authors: i.e. the hardware) is decisive in the use of robots. The most important and most difficult and, over the long haul, the most costly and expensive is the software."[6]

The fifth point relates to the application of microelectronics together with the miniaturization of automation technique, the higher labor velocity, the flexibility and reliability of the systems, the relative and absolute reduction of energy and raw material consumption as well as of the maintenance and repair expenditures. Especially important for the cost and efficiency level of automation technology is the further sustained positive cost/benefit ratio for microelectronic components. It is nationally as well as internationally perceivable that dropping or stagnating prices for components are also going to contrast in the future with an electronic performance growth in magnitudes.

Table 1 demonstrates those trends by the example of the development to be expected on the capitalist world market for microelectronic storage elements. Accordingly, the price for chips per million is to plunge from $ 50,000 in 1973 to $ 60 in 1990. Particularly via its exponentially growing functional crescendo and the exponentially falling cost/benefit ratio of its components (while resorting less to resources), microelectronics creates its potentials for the development, production, and application of labor, fund, material, and energy-saving automation techniques.

The development of automation technique proceeds in close interaction with that of process techniques. Compared with the extremely high developmental speed of automation technique, initiated by microelectronics, the process techniques at this time change still relatively slowly.[7] The rapid development potential of automation technique based on microelectronics already runs up against constraints due to the slow rate of innovation in process techniques. Such a reversal is indicated that conventional process techniques can now put a drag on the further development and effective use of automation. "More efficient and cheaper storage units and control systems can less and less be grafted onto aggregates of conventional design. The designs themselves under the impact of improved control techniques are drawn into the accelerated process of change."[8] The advances in machine tool construction, e.g., are mainly based on the application and constant upward development of modern CNC [computer numeric control].[9] That development, however, in no way means that existing proportions will continue forever. On the contrary, automation strategies will in the future have to focus on including new process techniques. Also in this sense must one understand the guideline for the new phase of the economic strategy, "to boost efficiency and productivity importantly through new products and modern technologies."[10]

The long-term development of automation technique and, hence, its efficacy to perfecting the production structures, the economic efficiency and performance improvements, will, especially after 1990, be significantly marked by the development of computers with a so-called artificial intelligence (computers of the 5th generation). By this developmental trend one will reach the transition from simple, formal to combinational data processing, to knowledge processing, as it were. Systems of this sort will form the basis for solving complicated labor requirements and supporting rapid and expert decision-making. They will facilitate, e.g., the input and output of data by means of natural languages and graphics, the development of highly integrated programming, a higher qualitative development of decentralized data processing, and its link with other systems over large geographic distances. Extremely efficient computers will form the basis for new generations of product and process controls.[11]

Table 1. Trend of the Cost/Benefit Ratio for Microelectronic Storage Units on the Capitalist World Market

	1973	1978	1983	1988	1990
Cost/benefit ratio ($ per megabyte)	50,000	5,000	500	100	60
Storage capacities (kilobyte)	1	16	64	256	1,024

Source: "The Price Miracle," CHIP, No 10, 1984, p 266.

What is uniquely important in this trend is that the production intensification becomes feasible in a new fashion. That sort of a level for ADP facilitates within the process of comprehensive intensification a shift of emphasis for production boosts from a primarily physical to a primarily mental type of work,[12] which opens up virtually unilimited potentials for intensification. So automation becomes an essential and stable factor of comprehensive intensification, effective on long-term, because it greatly controls the level and dynamics of productivity and efficiency.

New Quality of Automation and Comprehensive Intensification

What comprehensive intensification is all about, after all, is that, on the one side, the entire economy, all its sectors, not just some branches or combines, will move toward intensification, including even the sector of individual consumption, and, on the other side, the cost/benefit ratio is improved, relative to all types of outlays and forms of consumption, and by use of all intensification factors.

Proceeding from the various influences indicated on the continued stable shaping of the intensification processes, the following effects of qualitative changes in automation seem to be especially significant.

First: Practically, automation solutions can take effect in all production and labor sectors. The automated field of application therefore expands fundamentally. Thus far, the direct production processes in energy and operations techniques and the large series and mass production were preferred fields of application. Yet in the future more or less all sectors of the social production and labor process will gain access to automation. Thereby automation invades fields of work that had hitherto been reserved to immediate human action or were typical of the lower levels of mechanization. That circumstance has extraordinary consequences for the intensification process and is tied up with pervasive socioeconomic changes.

Through the possible extension of automation to mental work in the sectors outside of material production and in the non-producing sectors, but also through possibly including direct production processes that had thus far been largley closed to automation, such as small and medium-series production, the field for the economic application of automation techniques becomes much wider, and new and stable intensification factors can on the long run be opened up.

The scope of the sectors of "non-material" mental production, the production of ideas, concepts, consciousness and its forms, as Marx and Engels put it,[13] increased steadily in the past. In highly developed industrial states the number of those directly engaged in production receded or stagnated. The number of those engaged in the sectors ourside of production and in non-producing sectors climbed considerably in part, a trend typical also of the GDR, as Table 2 demonstrates. The automation that is possible for primarily mental work leads in those work areas, in addition to essential performance improvements, to a relative or absolute saving in live labor, to a reversal or narrowing, i.e., of the developmental tendencies thus far. While in the past the indirect production sectors primarily were the sources for gaining manpower, in the future that will also be true of sectors of primarily mental work. This labor is highly skilled, mind you, for which the social reproduction expense and reproduction period this way can relatively much be reduced. In 1980, e.g., 62 percent of those engaged in R&D were made up of college and technical school graduates. Their proportion of the work force in non-producing sectors came to some 43 percent in 1983. Nearly half of the work force in our economy with college or technical school diploma is in non-producing sectors.

However, in the historic development of the social division of labor at the same time important productivity and efficiency differences evolved between the sectors primarily with physical and those primarily with mental work. Office work performance developed much more slowly than the productivity in material production. Expert estimates indicate that in the last 100 years (1880-1980) productivity rose by some 1,400 percent in the world; yet the rate of performance improvements in the office, and so also that of production preparation, is said to come only to some 40 percent. The discrepancy is, not last, attributable to that each office job in the period under consideration made for less than one-tenth of the investment placed for a release in the productive sector.[14] How important it is to overcome, particualrly, this gradient in efficiency becomes clear when one considers the developmental trend in the ratio between principally physical and principally mental work in the total social labor system (cf. Illustration 1). Even if the trend shown in that illustration may not have been as even and at the indicated altitude, historically speaking, the rapid increase in principally mental work over recent decades is clearly apparent--as it is also borne out by Table 2.

Yet to the extent that primarily mental work becomes the decisive component in the production and labor processes, its efficiency likewise becomes the decisive factor in overall economic efficiency.

The possible increase in the efficiency of mental work by means of a qualitatively new automation technique constitutes an essential point of departure for accelerating scientific-technological progress as the most important intensification factor. Particularly in the science-technology-production-sales cycle, the efficiency of the principally mental work becomes the crucial factor.

Table 2. Trend of the GDR Employment Structures

Years	Ratio between Employees in Non-producing Sectors and Total Work Force (Percent)	Proportion of Production Workers to Total Work Force in Industry (Percent)	mvI[a] (Percent)	R&D Personnel (College, Technical School Personnel)	Total
1955	14.2	72.3			
1960	15.5	71.4			
1970	17.5	65.2	60.4	127,000	67,000
1975	19.0	66.0	60.2	162,000	94,000
1980	20.1	63.5	58.4	182,000	113,000
1983	20.7	63.1	58.5	200,000[b]	

---

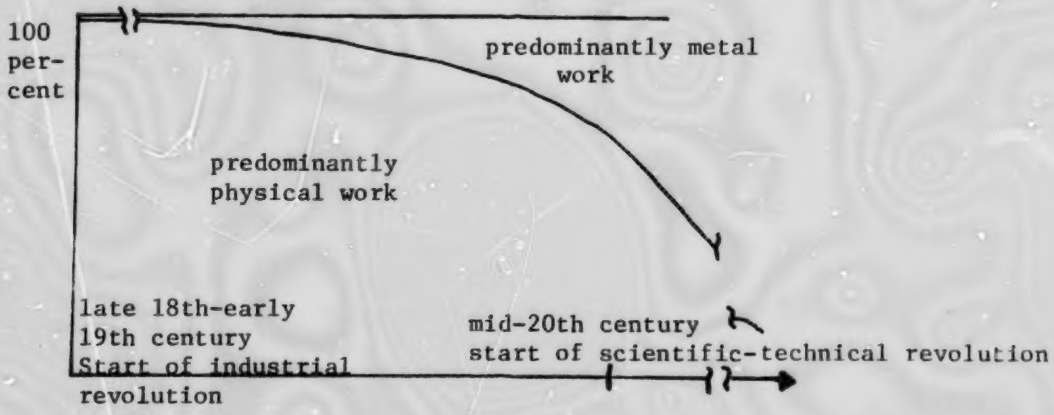
a) mvI=metal-processing industry. In FRG machine building the 75.5 percent proportion of 1960 dropped to 60 percent in 1980. b) 1984.

Source: From data in GDR Statistical Yearbooks and "Blickpunkt Wirtschaft" [Aspect Economics]: "Hohere Effektivitaet durch Wissenschaft und Technik," 1984, p 77.

If one wants to create fundamental scientific-technological insights and solutions for problems, one must have a modern research technique and use it effectively. The point is, after all, to open up to social production an "exceptional" productive force through the R&D process. As the use of machines multiplied the efficiency of physical work, the same will be possible for mental work. The tasks of future developments plainly also has to be to ensure optimal interaction between man and automated working tools in processes principally mental in chracter, so that there too man can become ever more effective in conformity with his performance qualifications. With the increasing linkage between science and production, the efficiency of the material production processes will increasingly be determined by the efficiency of scientific and scientific-technical work which, after all, is primarily mental in nature. The proportion of created value by mainly physical work declines in tendency then, whereas that from mainly mental work increases in tendency. Crucial, however, is the "economic use value" of the results of scientific-technical work because through it the production preparation sectors, such as design and technology, affect the production costs, in machine building, e.g., to between 60 and 80 percent, and the operations periods in small and medium-series production, to circa 55 percent. Increasing the efficiency in the pre- and post-production sectors through various technical-technological factors has positive effects on reducing run-through periods and costs, on possibly raising the product turnover, the quality of output, and the reaction capability to changing market requirements, and in the final analysis it more and more determines the efficiency of the entire operational reproduction process.

Labor processes not automated in immediate material production thus far for economic reasons now can be opened up to automation and dealt with on a higher qualitative level. These are mainly activities where both man's physical and mental work is taken over by robot technology, for instance in assembly processes. In 1980, the proportion of "manual work" in material production was still only 30 percent, but in assembly work almost 70 percent was handled manually, and in auxiliary processes, i.e. intra-plant transport and repair, it came to roughly 60 percent.[15] These "residual positions" of mainly physical work in the production sphere can increasingly better be integrated with automation processes. Process-flexible robots, automated transportation and assembly systems, and other automated machines, devices and installations form the material basis for a more comprehensive intensification of the direct and indirect production processes.

Illustration 1. Trends in Reaching Relative Self-Reliance by Predominantly Mental or Physical Work



It is essential for enforcing comprehensive intensification that all production and labor sectors become more efficient, whatever their size. In the early 1980's, mainly the site-concentrated large enterprises would use the efficiency potential of the new automated technology, but in subsequent years it would make rapid inroads into small and middle-size enterprises. Japan, e.g., expects to operate circa 40 percent of all installed robots in enterprises up to a work force of 500 by 1985. Table 3 shows the estimated spread of some new automation techniques in the United States in terms of size of enterprises.

It is apparent that the future use of this technology is envisaged especially for small and middle-size enterprises. This development is of great interest also to the GDR. Especially in the processing industry sectors there are relatively many medium and small enterprises along with the large-scale enterprises. In the circa 1,350 machine and vehicle construction enterprises, e.g., a high percentage of the workers and employees can be found in enterprises up to a work force of 500.[16]

The use of new automated technology will become an important element for more broadly exploiting the intensification factors also for all middle and small enterprises, in the long run. In our view, the trend toward basically expanding the field of operations is the decisive technical, economic, and social thrust evolving from the new quality of automation.

Second: Another important developmental trend lies in the increasing complexity of automated solutions, i.e. automated single working tools, groups of working tools, and whole processes. This actually involves three closely entwined processes. For one thing one can see the tendency toward an increasing installation character of the working tools, the transition from single machines to machine systems and automated enterprises in production. Secondly, complex territorial automation solutions which already embrace parts of production and labor and consumption are becoming more important. Finally, the possible data processing in all sectors of the reproduction process becomes more complex through integrated information and communication systems. The technical development of all three sides depends significantly on the status and further development of information technology and its integrating capacity.

Table 3. Estimated Use of Automation Technology in Terms of Sizes of Enterprises in the United States (enterprise size proportions in percent)

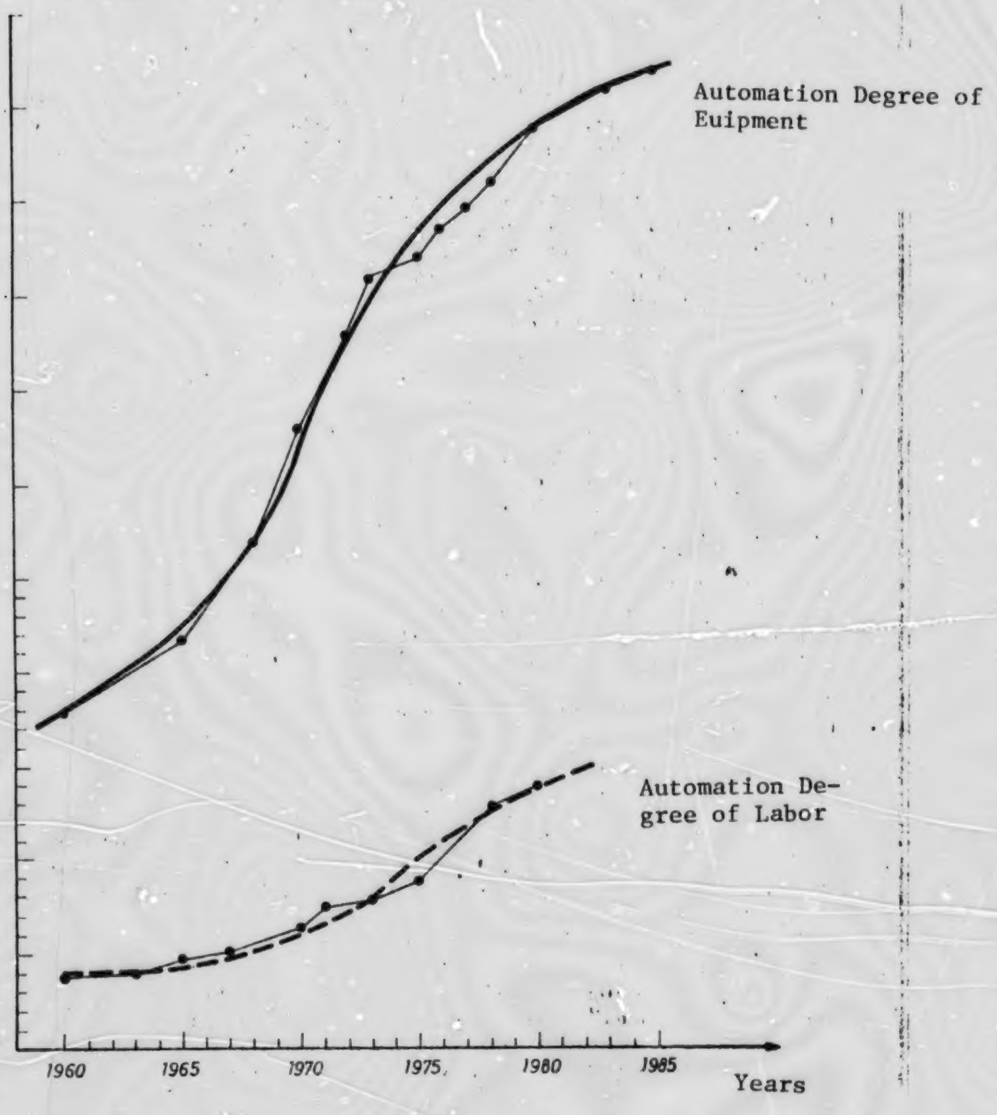
Use of		1 to 99	100 to 499 employees	500 and more
CAD/CAM systems	(1)	2	8	50
	(2)	15	35	90
CNC-controlled machines and processing systems	(1)	0	4	65
	(2)	10	25	96
Industrial robots	(1)	5	12	45
	(2)	20	35	83

---

(1) Roughly between 1980 and 1981. (2) Five to 10 years later.
Source: From H. Berndt, "Capitalist Rationalization with Flexible Processing Systems," IPW BERICHTE, No 3, 1984, p 27.

Continually running production processes in energy and operations technology have come for some time with a high degree of complex automation, which results in particular from the high technological thrust of those processes. Discontinuous production processes, on the other hand, were given much less complex a degree of automation thus far. Especially in those enterprises the development is such that would lift the production enterprise onto a higher level as a streamlined production-organizational and production-technical system by means of using a qualitatively new automation technique. In machine building, e.g., the transition from a single machine via technological units to integrated production sectors in which the needed work piece, tool and information flow traverses through a complex system can be seen. Such a development is reflected, for one thing, by a steady elevation of the degree of automation in the equipment and, then also, by its differentiated dynamics (cf. Illustration 2). Roughly

Illustration 2. Development in the Degree of Automation of Labor and Equipment in the Centrally Managed Industry of the GDR



between 1960 and 1973, a relative growth can be seen (mainly an extensive expansion of automation technology in use), yet the relatively small increase between 1973 and 1985 also reflects a stronger linkage of automation equipment into larger complexes due to the transition to a primarily intensive basic assets reproduction (modernization of extant installations). The further spread of automation to always again new production and labor fields is going to lead once more to a progressively increasing trend.

Through the upward development of automation technology, especially the use of computer hierarchies and their being coupled with automated machines, devices, and installations, conditions have become ripe for focusing the automation strategies in all producing sectors on complex solutions throughout. "Automation solutions introduced without regard for the overall connection between production preparation and production operation can always lead only to partial results which mostly, moreover, are unstable in terms of time."[17] That calls for coupling the processes of design and technology, planning, management, and supervision, the materials economy, storage, and transport directly with the production process itself. Complex automation thus presupposes the comprehensive connection between the principally physical labor processes and the principally mental work activities--ultimately a complex fusion of all energy, material and information flow into one unified production process. The increasing complexity of automated solutions then also leads to a progressive integration of all main, auxiliary, provisioning and clearing processes in production. That development leads to automatic systems combining the process computer techniques and the machines equipped with microelectronic controls, the industrial robots, the transportation, transshipment, and storage systems, the measuring, testing, and assembly techniques, and the computer-aided jobs in design, technology, and administration. That goes hand in hand with much of an intensification of the overall technological and economic processes.

Along with the requirements for a better control over the process parameters, complex automation mainly relates to reducing the run-through periods in the production processes and to shortening research processes and the material and financial turnaround, the acceleration, in other words, of the processes in operational and social reproduction. Erfurt's Forming Equipment Combine, e.g., through using complex automation (especially CAD/CAM solutions), was able to trim the run-through period from the signing of contracts to the sale of the commodities from the previous 16-18 months to between 6 and 8 months. Automated systems are the basis for increasing the production upgrading rate of 11 to 16 percent in the early 1980's to more than 30 percent in 1986. Isolated rationalization solutions often lead to remarkable results in cutting down the time frame without the production cycle for the commodities on the whole being significantly reduced because elsewhere the time gained is lost again. Complex solutions are needed to make effects like that take hold. Controlling the time factor as a key issue for the attainable increase in production efficiency also is lastingly affected precisely by the complexity of automation solutions.

Territorial complex automation solutions embracing parts of the production and labor sectors and consumption can constitute another important point of emphasis for comprehensive intensification. The use of ADP is the basis for the development and application of complex automation solutions for heating, the aeration and ventilation of buildings, gas and water supplies, the producing and using of secondary energy, and the resolving of ecological processes. An important field of application here is the so-called structural automation with its broad opportunities for making optimum use of territorial resources while possibly improving the working people's working and living conditions.

Of special importance to further improving the efficiency of the social reproduction process through comprehensive intensification over the long haul is the now rapidly evolving formation of complex information and communication systems. Such systems close the time and space gap between information supply and demand; they make it possible for any kind of information to be furnished and used at any time. They permit a rational control over information, enormously increasing with the growing acceleration of the scientific-technical progress, and a decisive intensification of the now still very expensive process of data procurement, processing, and handling. They thereby lead to a more comprehensive and qualitatively improving control over data processes in all sectors of our economy. Directly supplying and processing data by complex information and communication systems becomes more and more a task of fundamental importance for the economic growth of our economy in many fields of the economy, production, and above all of science. Solving that task will in the future become an important prerequisite for controlling the science-R&D-production-sales cycle more effectively and at the rate required by modern productive forces development and the competition with capitalist industrial countries. Partial data systems in specific enterprises and sectors are combined into ever increasing units and tend to embrace all steps, phases, and sectors of social reproduction. Precisely in this field one can see most clearly that the increasing complexity of automation solutions is an essential condition for comprehensively explorable fields of effectiveness.

Third: Another basic trend in the qualitative change of automation is the higher flexibility of automation solutions. That is largely due to the technical-economic status of microelectronic automation techniques, i.e. to the quality of product and process controls, the computer and ADP technique, and the available usable software. Often the importance of higher flexibility is narrowed down and related only to the techniques in small and medium-size production of the metal-processing industry. Such a narrow view of the basic change in automation fails to see the abundant opportunities for opening up the efficiency potential as to the fields of application shown under point 1. The higher flexibility of automation solutions undoubtedly is a general trait of the new quality of automation. Many examples demonstrate that more and more industrial production processes and labor processes in non-producing sectors are being flexibly automated. Only circa one-third of the flexible industrial process robots found in our economy are assigned in the centrally managed sector of our metal-processing industry. Microcomputers for drawing pattern designs and control automated knitting machinery in the textile industry, e.g., are trimming the expenditure of live labor for a pattern design from 1,400 to from 10 to 40 minutes per pattern and permit effective production at a lot size reduction from 20,000 to below 100 pieces.[18]

Creating and efficiently using flexible automation solutions becomes increasingly an economic requirement for the combines and enterprises so they will meet faster and more comprehensively the multiple conditions of scientific-technical progress with respect to product innovation, increasing product variety, and a higher speed in the spread and width of application of the products and of export needs and requirements. Economically using science and technology especially by way of new products which as production instruments also promote new technologies offers a unique opportunity for bringing out new products with less investment of live and embodied labor. Implementing the central guidelines on obtaining an annual average upgrading rate of 30 percent for industrial production and 40 percent for consumer goods production will in the future be dependent on how well we succeeed in making the operational reproduction process more flexible. A flexibly usable automation technique therefore becomes more and more of an essential prerequisite for efficiently resolving the increasingly sharper contradiction between the high dynamics in the product and technology development on the one side and the economic use of long-lasting basic assets, on the other.

Internationally, demonstrating a flexibly organized field of operations for automated techniques counts among the outstanding criteria for the efficiency of automated working tools. While only a few years ago machine tools under CNC control were mainly meant for use in small and medium-series production, now the CNC more and more deeply penetrates the entire machine tool assortment and replace highly productive conventional automation equipment while boosting the performance. Machine tools under CNC control--often exposed as synonymous with the flexible automation of small and medium-series production--also increasingly enter the sectors of large-scale and mass production, where they also make possible a higher flexibility of the working tools, compared to what previously mainly were separate automated single-purpose machines. It is apparent that microelectronic machine and installation controls are penetrating ever more deeply the working tools of all production sectors. The flexibility of automation solutions thus is not the sole preserve of automation for small- and medium-scale production.

The economic effects of high flexibility reveal themselves mainly in connection with the greater complexity of automation. Single flexibly automated means of production do provide partial efficiency advantages but they do in no way place the industrial production process onto a qualitatively new level. To bring the advantages of the flexibly automated working tools to full effect, their development has to be coordinated in all labor processes--in production as well as in the pre- and post-production sectors--and their effect has to be passed on to the production process on the whole.[19] Achieving a high flexibility in the production machinery thus also always calls for complex automated solutions.

On Some Social and Structural Aspects of the New Quality of Automation

The new quality of automation, based on microelectronics, leads to penetrating, revolutionary changes in the material-technical conditions for the existence and development of our society. Of elemental importance, as already pointed out, is that automation can far exceed the limits of its application thus far and thrust into new sectors of social production and labor. On the one hand, comprehensive intensification is thereby placed on a much broader base and, on the other hand, automation exercises a much deeper influence on various sectors of public life closed to it thus far. The rate and breadth of application of automation then determine no longer merely the possible opening up of a broad effective field, they affect also the scope of the involved, and to be controlled, social effects and changes in the social organization of production and labor. The economic, social, and organizational effects are, as shown above, by no means confined to the immediate area of production. Basic changes occur in those sectors which, in contrast to material production, had thus far remained relatively untouched by technical progress and its social and organizational effects. The social changes in the spheres of principally mental work will undoubtedly be no less significant than those in the production processes as such. The gradual surmounting of essential differences between physical and mental work, today and in the future a basic requirement, as it were, for increasing productivity and efficiency, for satisfying social needs in the production and labor process, and for the further unfolding of the socialist way of life, receives its technical-technological basis from the new quality of automation, without which it is impossible.

One of the special factors relative to the social concerns of the working people, their working and living conditions, while also important for intensification, is there the technically and economically necessary production and labor regimen of "around the clock." "High capacity use of machinery and installations in connection with multishift use of them more and more becomes the pivot and fulcrum for economic advances in the field of intensification as such."[20] Along with a steady increase in shiftwork in production itself, the capacity use of modern technology is already increasing today in data processing centers, on computer-aided design, project planning and technological jobs, at the social and health provision facilities in enterprises, in municipal transportation, and at modern research institutions. At the same time, through automation on the basis of microelectronics possibilities are indicated for largely shifting night shifts that go hand and hand with three and multishift operations from man onto technical means, expressed, e.g., in nightshift labor that does not call for much service or in "unmanned" operation.

Precisely during the transitional phase from the "social exception" to the "social norm" automation leads to new and higher labor requirements, conditions, and relations. While it makes possible cutting back in hazardous and heavy physical and monotonous work, it also enriches the substance of labor. Just think of the use of flexible process robots. On the other hand, it makes higher demands on the working people's willingness for training and advanced training, their flexibility and mobility, and a systematic control over manpower changes within and among enterprises and facilities. Enterprise or combine-internal solution variants no longer can deal with this development. Territorial and overall social complex solutions become necessary. Yet this relates not only to matters of infrastructural safeguards, it mainly relates to questions of social and moral recognition.

The economic and social effects of the new quality of automation are determined not solely by the qualitative and quantitative changes in automation technique. Of importance also are pervasive changes in the social organization of production and labor. Because of the high efficiency of automation solutions and their complexity and flexibility, the production cycle must be organized in such a way that novel and marketable products can be produced in small and medium lots and at broad assortments without any loss to efficiency gains, perhaps by reducing the run-through time frames and a working capital tie-up through limited cooperation relations. For that reason, there are then entirely new demands made on the qualitative and quantitative organization of socialization processes. Ancillary industry, for example, must meet higher criteria for flexibly making available, proper as to qualities and schedules, ancillary products suitable for automation. Connected with that, we must further improve the systematic control over a high flexibility of the economic activity of our combines while they continue to become further entwined in our economy.

The ongoing process of an upward qualitative development of the material-technical base of our economy relying on automated machinery, devices, and installations new in quality proceeds not without contradictions. That there is a "broken in" technology technically and organizationally dominating the production which is of course in part an old technology, is inhibiting to some extent.

The experience of recent years shows that, on the one side, there are greater chances than are thus far being used for modernizing through matching microelectronic automation technology and the connecting of conventional techniques with CNC machinery, flexible industrial robots, computer controlled transportation and storage systems, and other things like that. On the other side, one also finds that not the whole available machine and equipment park is suitable for an effective modernization. The modernization of what there is must be considered an extremely important way for reaching the qualitative upward development of our material-technical base with a high economic and social impact, combined with the indispensable part of new equipment allocated through the investments of our economy.

There will however also be differentiations in the whole qualitative transformation process of the material-technical foundations of social progress. Evolving complex-automated production enterprises in the processing sector and more complex information and communication systems is a topical task which, however, also ranges into the far distant future and calls for high scientific, educational and investment appropriations. That enforces a graduated realization while capacities and funds have to be assigned in a concentrated and complex manner. These are no mean efforts our economy has to make to carry on this development.

Characteristic, however, of the future development of comprehensive intensification is that the acceleration of scientific-technical progress in all fields is most essentially based on the use of modern data and automation techniques. Their preferential development, production, and application therefore remains in years to come a fundamental requirement for economic structural development. At the same time, this development in many sectors of production requires profound technological transformations the likes of which one could not even imagine only a few years ago.[21]

For more resolutely implementing automation in the years ahead, there are especially four aspects that seem to be of essential importance:

First, it is important to activate all conceivable efficiency reserves of automation through minimal fund allocations. That makes it necessary to continue in carrying on the so-called partial automation, the use of separate automated machines and devices within the production process as is--on a level, to be sure, that is determined by microelectronics. Along with the new introduction of automated production and working tools, a dominating role continues to attach to the modernization of extant fixed assets even for more complex automated techniques. Important prerequisites for that are a fundamental reorientation of rationalization means construction toward a broad assignment of microelectronic automation techniques while safeguarding the software requirements.

Second, for future conceptualizations for automation solutions, one must start with the aspect of their consistency. Then one will have to bring together at the same time, consistently, on the basis of a technical-technological change fashioned by the accomplishments of the scientific-technical revolution the production sector-related individual solutions on automated production complexes and, ultimately, for fully automated enterprises. This mainly involves implementing economic innovator processes that greatly require the use of modern automation technique, whereby they assentially affect the scope and degree of automated production. They call for a more long-term priority-oriented and concentrated allocation of capacities and funds at a closed and division-of-labor type cooperation in science, research and development, production, and application.

Third, the international developmental tempo in automation demands to come up with the first complex-automated enterprises as pilot projects already in the next few years, mainly in the machine building sector, in order to learn to deal with the many altered conditions like the coping with organizational structures, the linking of transport and storage processes including measuring and testing techniques, involving the pre- and post-production sectors, the development of software, and changes in working and living conditions, while at the same time gathering experiences for producing such technologies.

Fourth, it is important systematically to cope with the already referred to social and organizational concerns and consequences.

These aspects of the continued implementation of automation indicate that the future reproduction processes in the combines and territories, though identical, will and have to proceed unevenly in terms of time and locations. To these diverse conditions the economic cycle of combines as well as the branch and territorial management and planning process have to be adapted.

SCIENTIFIC LABOR ORGANIZATION'S ROLE IN COMBINES' PLANNING

East Berlin SOZIALISTISCHE ARBEITSWISSENSCHAFT in German Vol 29 No 6, 1985 pp 416-422

[Article by Dr of Economics Rudolf Hempel, scientific assistant at the Central Research Institute for Labor; State Secretariat for Labor and Wages. Original title: "Direction and Planning of Scientific Labor Organization in the District-Directed Combined Works"]

[Text] Comprehensive use of the Scientific Labor Organization (WAO) within the framework of complex socialist efficiency measures requires that its methodical approach also be ensured in the district-managed combine. Observance of three closely linked tasks is an essential condition.

1. Managerial rule of the WAO, and its complete inclusion in operational planning.
2. Firm inclusion of workers in solving the tasks of WAO.
3. Continuous training and qualification of the necessary cadres in order to create an appropriate qualifications level in the area of WAO.

These factors are of growing importance because of the large number of small and medium-size enterprises, the numerous technologies applied and products manufactured, and the progressive interlocking of combine enterprises within a district-managed combine.

To study the process of WAO inclusion in management and planning of district-managed enterprises and combines, existing experience of centrally managed combines was used and specific solutions were worked out, paying attention to the special circumstances of district-managed industry. In close cooperation with the economic council of the Dresden district, they were successfully implemented in the state-owned Praecitronic combine Dresden, and were recommended to other district-managed combines.

An essential component of managerial activity in the area of WAO is the planning of WAO measures. It proved correct in principle to derive WAO tasks directly from the intensification and efficiency concepts of the combines and enterprises. From these basic documents, development of a WAO concept is recommended for the conceptual plan preparation in every district-managed combine enterprise and every structure-determining combine plant. It is to be part of the plan sector Science and Technology with its "long-term concept of the use and better utilization of society's work potential" (with regard to gaining more manpower and job savings), the plan sector Working and Living Conditions (with regard to improving material working conditions), and to be coordinated with activity plans to increase shift work and reduce job-related difficulties and exposures, and a five-year plan is to be prepared.

A detailed general part of the concept contains aims and study areas of WAO work, distribution of tasks, structural questions and a rough guide to the indices for 5 years in the district-managed combine, as well as a part of essential indices and tasks to be specified annually. Presetting of the following indicators is recommended:

Current Year	Plan Year	
Probable Actual Figures	State Task Setting	Draft Plan

a) Working hours saved through measures of WAO (Th) in total;
of these, saved through the following technological steps
--major production processes
--auxiliary production processes.
b) Number of existing jobs (total of workers and employees);
of these, production personnel, management/administration.
c) Total number of jobs eliminated;
of these, production personnel, management/administration.
d) Total number of jobs changed or redesignated.
e) Total number of personnel gained for new tasks;
of these persons, for
--new tasks in the enterprise and in factories of the combine overall (relative gain)
    for greater utilization of the production funds
    for expansion of rationalization funds and the research and development potential
    for expansion of consumer goods production
--tasks in other enterprises and combines of the region (absolute gain).
f) Jobs where exposures occur (total number).
g) Exposed workers (total number).
h) Workers, at whose place of work exposures with health risks are being reduced (in case of several exposures) or eliminated, respectively (subdivided according to types and amounts of exposures).

These indices must be brought in line with state reporting.
Annual tasks must be planned, taking into consideration the major thrusts of WAO, enforced through individual measures, and categorized in the following manner:

1. Complex WAO measures
2. Introduction of typical WAO solutions
3. Development of manual work processes
4. Improvement of work and production organization
5. Tasks to improve material working conditions, including restructuring of exposed jobs.

Tasks of job classification and the development of new work norms and performance indices should be an integral component of all measures.

Table 1 presents the linkage between planning of WAO measures. This creates the conditions for planning all necessary personnel and material-technical prerequisites for exacting WAO work.

In the complex introduction of WAO it proved useful to establish an efficient WAO structural unit in the main plant of a district-managed combine, which carries out planning, coordination, implementation and the accounting of the WAO tasks of the combine. The following tasks are the focus of this structural unit.

Key:

1. Long-term concept of social efficiency-intensification
2. Concept of product and technology development, as well as investments
3. State tasks/state requirements
4. Plan sector: science and technology
5. Plan sector: fixed asset reproduction (investments)
6. Coordination plan of effectiveness
7. Complex WAO studies
8. Plan discussion in all areas
9. Plan sector 4 fixed asset reproduction investments
10. Plan sector 7 working and living conditions
11. Plan sector 1 production
12. Plan sector 6 work productivity manpower
13. Plan of WAO measures - WAO concept - component of plan sector science and technology
14. Short-term Measures: Immediate implementation within framework of plan
15. Medium-term Measures: Implementation under annual plan
16. Long-term Measures: Integration into long-term concept of social efficiency

--Development of WAO concept, and transmittal of preset requirements to the factories of the combines;
--Planning and accounting of the indices and measures vis-a-vis the management authority;
--Guidance for WAO mandataries in the combine enterprises and for WAO specialized cadres in the departments preparing production;
--Carrying out WAO analyses including preparation of data for job organization and classification;
--Planning and coordination of these preparations, and introduction of normatives and indicators on a company and above-company level for work productivity and sector-specific standard values for the labor force;
--Implementing formation of WAO collectives, and giving them guidance and support;
--Organization of an exchange of experience above the company level, and performance comparisons on the best technologies, progressive work methods, forms of wages, and results of work with normatives and indices of work performance;
--Implementation of hygienic work norms, and reduction of influences endangering health and obstructing work;
--Cooperation with institutions above company level (production group, AWZ, institutes of technology).

However, implementation of WAO is not solely the job of the WAO structural unit, but requires interdisciplinary cooperation, since every sector has to solve specific tasks.

Since not every plant can have an official chiefly responsible for WAO, due to the size and structure of combine factories of district-managed combines, the use of WAO mandataries has proven useful in assisting plant managers. These colleagues should be politically experienced cadres who command respect and authority and possess high expert knowledge in the area of WAO, classification and normatives; preferably, they should have authorization to measure harmful substances, or be willing to qualify for it, respectively.

The WAO mandataries in the combine enterprises have the following tasks:
--On the basis of the combine's WAO concept, the indices set for the plant must be prepared and are to be proved by accountable measures, in coordination with the plant manager. The measures become part of the plan sector Science and Technology and must be controlled and accounted for.
--They are partners of the plant director for all WAO questions, as well as in the introduction of productive wages in the enterprise.
--They must provide guidance to the leaders of WAO collectives, including suggestions for qualification measures and organizing an exchange of experience.
--Timely and comprehensive inclusion of all workers in planning and implementing WAO measures, in connection with the appropriate state managers.

Furthermore, trained specialized WAO cadres are to be integrated in the production-preparing areas of science and development, technology, project planning and development of efficiency funds, in order to realize the specific tasks of WAO in these areas. (Footnote) (See R. Hempel: Including WAO in efficiency measures of district-managed combines, SOZIALISTISCHE ARBEITSWISSENSCHAFT, 1985, No 5, p 333.) Labor-scientific requirements must be prepared and applied in the new or further development of products, processes, technologies and the shaping of work places and processes, so that they become effective in future work processes. For example, every production preparation should contain work with specific labor-scientific demands and their realization in the course of development. The WAO group leaders of the main plant perform a guidance function in this, just like the WAO mandataries. A proposal for possible integration and subordination of specialized WAO cadres in district-managed combines is shown in Table 2.

work hygiene

The forming of WAO collectives proved helpful in all areas in support of the work of these WAO structural organs and in a broad inclusion of workers in the rationalization process. It is important to develop staff management along the lines of the Schwedt experience. To coordinate tasks, we recommend that the combine management or main factory establish a WAO staff.

The WAO staff, consisting of top level managers, the party secretary and the chairman of the plant labor union executive board (BGL), is primarily responsible for developing the basic work directions and goals of complex rationalization in the enterprise. This also includes establishing the main functions of WAO collectives in management areas, and control of fulfillment of these tasks. The specialized directors have the task of pinpointing these proposals with regard to the formulation of tasks for the WAO collectives. In larger enterprises, formation of a WAO panel for the management area is recommended for this work.

The WAO collectives are established in the individual management areas. Through their broad effect, they assist in complex socialist efficiency measures. Depending on the size of the enterprise and its departments, it is possible to form several WAO collectives within one management area. For solving cross-section tasks, formation of interdisciplinary WAO collectives has proven successful. Combine enterprises should proceed along the same lines. Typical WAO tasks for purposeful activities of WAO collectives were described in detail by Feig/Waldenburger. (Footnote) (See R. Feig/ M. Waldenburger: Erfahrungen und Arbeitsweise von WAO-Kollektiven, Schriftenreihe AUS DER PRAXIS - FUER DIE PRAXIS, No 12, ZFA Dresden,1984.)

Due to the staffing in the preparation departments of small and medium size enterprises, work with WAO collectives is imperative for complex socialist efficiency measures. Corresponding to differing conditions, the tasks to be solved by WAO collectives are also different. However, every manager should form a permanent WAO collective in his area of leadership and assign it topical tasks. Experience in centrally directed companies shows that WAO collectives--directly participating in analyses, projects and plans for measures--have contributed considerably to fulfilling operational goals.

Personnel selection should be such that it makes possible, on the one hand, the function of a consultation collective for the state manager in charge, and on the other hand, that of an implementation collective in carrying out WAO tasks. Main functions are participation
--in the planning stage of tasks and goals of socialist efficiency measures (intensification concept, WAO concept, plan sector Science and Technology);
--in preparation, particularly the analysis to uncover reserves and shaping of processes to be made more efficient;
--in implementing efficiency measures and innovative processes with the goal of improving the production flow and lowering stoppage and break-down times, making work easier and safer, eliminating jobs, and perfecting work methods.

WAO collectives should not have more than five to eight members. The specialized manager in charge should also be the manager of the WAO collective and direct it from task setting to implementation. It has proven useful to conclude WAO agreements between WAO collectives and the managing director, whose results must be defended before the management collective.

In addition to utilizing one's own possibilities for increased efficiency, in the case of small and medium size enterprises of district-managed combines it is also recommended that they utilize regional reserves. As the Stassfurt example shows, it is of advantage to these enterprises to receive the support of work groups "WAO--Regional Efficiency"--of the councils of cities, town districts and kreises. The goal setting of these work groups, which consists in assisting the enterprises in greater increases of work productivity and increased production of export and consumer goods, is achieved through an increased degree of mechanization and automation with a simultaneous improvement of work and production organization in major and auxiliary production processes, as well as improvement of working and living conditions of the workers. These work groups are faced with the task of giving support to utilizing primarily one's own efficiency means, but also including the cooperation association and regional interest groups. The work groups consist of experienced WAO cadres and technologists from the enterprises and scientific institutions of the region. Direction of this process by the chairman of the kreis council enables immediate implementation coordination with other work groups of the regional efficiency drive, such as "chief mechanics" and "fixed asset economy", as well as the cooperation association "Efficiency assistance."

A high level of qualification of the cadres in this field is an essential precondition for making WAO workable. Analyses in the enterprises of district-managed combines have shown that, on the one hand, the necessary or already existing WAO structural organs are not sufficiently staffed in qualitative terms and, on the other hand, that the present qualification level of managers, the cadres and experts of technical and economic universities and trade schools as well as all other personnel is inadequate in the field of WAO to solve WAO tasks with high effectiveness. In district-managed combines there are few labor-scientific cadres in the combine management; in the greater number of individual enterprises there are none.

For this reason, labor-scientific qualification and continued training of the cadres in enterprises of district-managed combines must become a permanent part of managerial activity in order to carry out the numerous tasks. This requires that WAO training courses for the qualification of specialists must be held, but also that labor-scientific findings be given to managers and engineering cadres (master craftsmen, technologists, project planners).

For training and continued education, close cooperation with the Chamber of Technology (KDT), technical universities and institutes has proven valuable. Qualification measures must be planned in cooperation between the managing area responsible for WAO and the director of "Cadres and Training." Among other things, there are the following possibilities:
--Qualifying proven skilled workers as labor organizers
--Courses on basic questions of managing and planning WAO work for managing directors and leadership cadres at industrial branch academies and institutes for socialist business management
--Continued education courses by the KDT (for example, WAO in management and administration, work classification, process analysis, work-hygienic complex analysis)
--post graduate studies for university and trade school cadres in the field of work economy and work organization
--Qualification for the procedure "shaping manual work processes."

ECONOMY

HUNGARY

GREATER EFFORT TO LURE FOREIGN INVESTMENT CAPITAL URGED

Budapest FIGYELO in Hungarian No 3, 16 Jan 86 p 7

[Interview with Bela Csikos-Nagy, academician and Executive President of the Industrial Policy Council [IPT], by Dr Gyorgy Varga: "Foreign Capital Is Much More Selective"]

[Text] The minister of industry created the Industrial Policy Council in 1984. The body is the consultative organ at the ministry's disposal. Academician Bela Csikos-Nagy, the Executive President of the Industrial Policy Council [IPT], was interviewed by Dr Gyorgy Varga about the role of imported foreign operating capital in making Hungarian industry dynamic.

We must give up the illusion that we can approximate the technological level of the leading countries of the world, even in a few areas, by depending exclusively on our own resources. The essence and value of importing operating capital is in the fact that it connects Hungarian technological and economic culture, at the most favorable juncture from the point of view of international competitiveness, with the appropriate foreign patents and manufacturing processes. This way, it is possible to assure that we do not fall too far behind the world vanguard, and in certain areas we might even come close to the leaders.

It is not advantageous to inject foreign capital into the economy of the country only in the form of bank loans. The disadvantage of this is that the lender does not take a risk on the yield of the investments; while it is largely those institutions making the decisions with regard to investments which are not subject to market influences. Anyway, nowadays it is only with the import of operating capital that the country can alleviate its shortage of capital.

[Question] These, however, have other, more profound consequences than taking on the burden of foreign loans.

[Answer] I do not dispute this, and it is necessary to speak about this candidly. First of all, we must admit that we cannot shape our ideas on structural policy in a completely autonomous fashion. But of course we could not do this previously either. The integration of international elements--if you prefer, intervention--would become more open, and we would have to weigh more firmly than we have up to now the comparative advantages and disadvantages of this in our development policy. Therefore, the import of operating capital would also reflect a value judgment of the market, because capital would only flow into those areas and endeavors which were attractive and promising. Foreign capital will be far more selective than we have ever been able to be.

Market Development

[Question] In one of your speeches abroad, you spoke about self-discrimination. What does this mean?

[Answer] Whenever we talk about the fact that the Hungarian export price level is low, many explain this by the differences in commodity structure and by Western discrimination used against us. Thus, no matter how badly we manage our economy, we can always provide an explanation for a decline in our exchange rate by mentioning these two factors. We do not, however, examine to what extent the reason for this is that we do not adjust well enough to the forms or norms of market and international cooperation, which would enable us to approach a higher price level. I called this behavior self-discrimination. The solution: market development. I think that our recognition of this fact is reflected in giving preference to the formation of mixed enterprises and commercial houses. Under the present circumstances, all of this can also contribute to more rapid industrial development as well.

[Question] Do you believe that industry is ready to abandon this pattern of self-discrimination?

[Answer] Look, there is no doubt that a lot of people are still thinking in terms of the 1960s, when the growth rate in industrial production, based on a rather dynamically increasing import of Soviet energy sources and raw materials and with a dynamic increase in CMEA-related export, could easily reach 5-6 percent annually. It is a fact that many managers of our industrial enterprises became used to this simple model for growth in production. However, this model is no longer usable. A new situation has arisen, and we have not yet succeeded in finding a suitable growth course.

[Question] I think that we are talking about a structural problem. . .

[Answer] . . . this is a false concept, i.e. the problem is structural only to the extent that accommodation, while a systemic question, is also a task of regulation and market development. Formulated more precisely: those who regard the competitive capacity of our industry strictly as a structural issue, could have a tendency to do away with those enterprises--or to reduce their production--which, with a more effective business policy, could bring the country profits. Nor should we forget the fact that certain products have cycles of greater and lesser profitability. For this reason effective structure cannot even be evaluated in a static situation. Also for the same reason, I have always had an aversion to the ranking of economic value of products at a selected time and to taking actions based on this type of attempt to change the scope of an industry.

I am convinced that, in addition to modernizing the regulations, the first steps on the road to a solution must be taken in market development. Our backwardness in market development is expressed in the simple fact that "we cannot sell in the West and we cannot buy in the East." Our export policy is still based upon treaties negotiated between the nations of the CMEA.

Hard and Soft Commodities

[Question] You mean that as long as it is possible to live off the CMEA market, our enterprises will not make any real efforts to break into Western markets?

[Answer] Yes, that is in part what I mean. Think about it: if they can live off a poor utilization of their capacities, then what would induce the enterprises to undertake work for the marketplace, which would be more difficult than what they have done up till now?

[Question] What tasks are awaiting solution with regard to market development?

[Answer] I will start with the non-enterprise tasks. Since to this very day the CMEA has not succeeded in joining the world market, Hungary as a country dependent on foreign trade must examine its own potential in this area. From this point of view it is also necessary to centrally stimulate the formation of commercial firms which would undertake hard currency-yielding commodity transactions. This is a more developed and modern enterprise form than that which we adopted in the 1970s, when we accepted Western equipment needed for our investments with the condition that the supplier would buy Hungarian manufactured goods. That, of course, was a disadvantageous business deal, because our foreign partner, regarding the purchase compulsory, calculated it from the start into the investment price. Diversified business firms are institutions of a different kind. They could represent a new type of area for the entry of operating capital. We first conducted discussions concerning this with the Austrians, and we are now ironing out the details of the concept.

[Question] Would the increase of Austrian foreign trade traffic be the main task of commercial firms operating as mixed enterprises?

[Answer] What is new in our thinking is that the goal would not be the growth in bilateral traffic but rather cooperation on so-called third markets, and in reducing actual discriminatory factors. This type of endeavor might improve the world market export price structure and reduce price losses in Hungarian foreign trade, and what is more important, it might also create an acceptable institutional structure for efforts directed at forming joint ventures by West European enterprises which have an interest in CMEA related export. Naturally, the precondition for this is that the treaty structure should not hinder the growth of ruble account export.

[Question] In the global strategy of transnational corporations Hungary plays little or no role as a market for special energy-resources, or as a sales market. The Hungarian market can become attractive to foreign capital primarily by performing the role of a springboard toward the rest of the CMEA market. In other words, for the transnational corporations the export of operating capital is primarily a question of business policy.

[Answer] I agree with you on this; this is why we should work very hard at bridging the gap between soft and hard commodities and convertible and non-convertible currencies. As far as the CMEA is concerned, foreign capital is self-evidently interested. In my opinion, Hungary should also be interested in offering products for the CMEA market that are more modern. If we fail to do this, our opportunities in this area will also deteriorate. If we could approach the level of more developed countries in the machine and chemical industries, or in certain segments of theirs, we could reduce the less advantageous share of foodstuff and light industrial commodities in our CMEA exports, to the point that this would not hinder the dynamic development of Hungary's industries. However, we still cannot sidestep the challenge of having to maintain a balance in ruble and dollar alike. Thus, we must find a comprehensive solution, one that takes care of the relationship between the dollar and ruble exchange rates. I am convinced that commercial firms which perform currency converting operations would be suitable for this task...

[Question] ...provided that they recommend the purchase of such a machine or equipment, or a product of such quality, for which the CMEA countries presently pay with convertible currency or with commodities of equal value. In fact, this is the substance of the solution found by the Finns and the Austrians for their foreign trade policies. Beginning with January, the regulations controlling the influx of foreign operating capital will be made more advantageous. Opinions on this issue appear to be uniform. Do you agree?

Debaters Who Agree

[Answer] Yes, and no. Experts have already reached an agreement concerning the basic question. On the other hand, there are a considerable number of people who disagree on the feasible size of foreign capital investment. My view on this is that anyone who does not consider the capital hitherto imported as insignificant in volume, in fact interprets the basic concept incorrectly. After all, just think about it: As early as 1973, the government gave the green light for foreign capital investment. And the result? As of now, we have invested a ridiculously low amount--perhaps not even 10 million dollars--in our industries. If there has not been a significant amount of foreign capital streaming into the country, this is primarily attributable to certain responsible individuals who have not done enough to encourage the process. On the other hand, the positive example of some of our enterprises demonstrates the effect of operating capital on such factors as technology, production discipline, organization practices and marketing.

[Question] What proof do you have to support this charge?

[Answer] There are a great number of industrial enterprises which during the past 10-15 years repeatedly turned to the responsible organs with proposals for the founding of multinational enterprises, and one after the other they were talked out of this. Instead of injecting foreign operating capital, the securing of bank loans was recommended. Of course, if an enterprise is repeatedly discouraged, it will discontinue experimenting; as a result, it can even be used as an argument that Hungarian enterprises are not predisposed toward becoming partners of foreign firms.

It is also part of the problem that none of our institutions is prepared for the import of foreign operating capital, and thus no one is able to promote the process with the appropriate authority.

[Question] You mentioned that there are indications that Austrian businessmen may be interested in joining Hungarians in forming multinational firms. Could you tell us more about this?

[Answer] Around the end of last year, the Austrian Zentralsparkasse initiated and conducted discussions on this issue. In the course of these talks, the idea surfaced that not only Austrian money should become partners in Hungarian commercial firms, but Hungarian operating capital should also be exported--possibly to Burgenland. After all, in that region it is possible to establish multinational firms very quickly, numerous administrative problems can be solved much more easily than in this country, and it is easier to connect foreign capital into industrial activities than in Hungary. Such initiative could be good practical training for us, while we create the conditions for the reception of foreign capital in our country.

In the interest of progress, however, we should avoid repeating the course covered since 1972, during which we either emphasized what cannot be accomplished, or tinkered with the regulations controlling the establishment of multinational enterprises.

A Threat of Failure?

[Question] As you pointed this out, the majority of our enterprises--with the exception of a few foreign trade firms--have no experience with the activities of commercial houses. Since the state promotes such enterprises, there will probably be an increased interest in creating firms of this type. Are not you worried about failures?

[Answer] This is a similar problem encountered in the course of creating a new type of banking system. In that case, too, we need new types of bank employees, one might say: bankers. But this should not prevent us from taking the necessary steps in banking; just as the threat of failures should not compel us to delay the establishment of commercial houses and the creation of conditions for the reception of foreign operating capital.

A similar debate took place in 1967: at that time the question was, is it possible to work without plan instructions, in view of the fact that plant managers were used to having their tasks annually prescribed to them in detail in the form of broken-down plans. I agree with you that certain types of people could reproduce certain mechanisms; however, in the final analysis people are formed by their environment.

[Question] All over the world, the import of operating capital is accompanied by management know-how, as well as technological know-how. We are in a similarly disadvantageous position when it comes to either of the above. Is it conceivable on a broader scale that foreign experts would participate in the management of our firms?

[Answer] Foreign management is already present in our presently existing multinational enterprises: In the persons of managers who may be foreigners or Hungarians employed by foreigners, as well as in the form of technological or organizational practices which are prescribed by the foreign investor-partner. One reason the foreign investor insists on retaining a majority of shares is the desire to guarantee a say-so in management practices. Certainly, foreign partners would not tolerate the kind of cost-profit ratio generally prevailing in Hungarian enterprises.

[Question] This, of course, implies that the issues of arbitrating the various interests and regulating wages would have to be re-considered soon.

[Answer] My opinion is that we will have to deal with these problems even independently of foreign capital, if we wish to start making progress.

[Question] In the recent past, English and Japanese businessmen stated that they envisioned two immediate pre-conditions for investing their capital in Hungary: Hungarian enterprises should come up with their own ideas and proposals; and profits on the amounts invested should be competitive with profits achievable elsewhere. Looking at it from this point of view, how do you evaluate the chances of foreign capital investment?

[Answer] I do not see any problem with either of these conditions. To start with the second one: Enterprises abroad usually figure on a 20 percent profit rate, but I must point out here that according to their accounting system profits include depreciation, and in this manner there is no appreciable difference between our profit-rate and the one prevailing abroad.

As for the first part of your question, I do not agree that it should always be the Hungarian firms that take the initiative. After all, capital can stream into areas where Hungarian enterprises do not even exist. I do not even believe that a large transnational enterprise would decide to invest in Hungary primarily because one of our (relatively small) firms suggested this. Just think back to the offers made by Japanese auto firms for the creation of assembly plants in Hungary.

As for the Hungarian enterprises, their readiness to initiate action in this sphere will increase by leaps and bounds, once they find out that they do not have to fight against overwhelming odds for the realization of their proposals.

For the first time in our history, the recently ratified Seventh Five-Year Plan mentions the investment of foreign capital, referring to it not as a measure designed to support and finance the fulfillment of the plan, but as an auxiliary resource, over and above the investments incorporated in the plan. This demonstrates that the government is ready to receive foreign operating capital. However, we still must learn how to manage this extraordinarily complex issue.

PROBLEM OF NEGATIVE INTEREST RATES DISCUSSED

Belgrade EKONOMSKA POLITIKA in Serbo-Croatian 23 Dec 85 pp 19-21

[Article by Tomislav Dumezic: "Debts Without Debtors"]

[Text] Almost all of the "structures" that have influence upon decision-making have joined in the offensive against the attempts made thus far to enthrone the policy of positive interest rates (otherwise, the interest on all credits together today covers about 50 percent of the rate of inflation) and the policy of the so-called real exchange rate for the dinar. The initial step was taken by the Federal Executive Council in its Draft Resolution for 1986, which, in addition to planning a 30 percent annual rate of inflation, also cites the need for a reexamination of the present interest policy (the period: the first quarter, perhaps in order to apply this new policy after the expiration of the present arrangement with the IMF on 15 May). This determination does not conflict with the attitudes expressed in the SFRY Assembly, the SFRY Presidency, and the Economic Chamber of Yugoslavia.

The latest concrete plan for bringing the rate of inflation down to 30 percent, which would be implemented next year with abundant support from the new interest rate policy, was drafted by the National Bank of Yugoslavia. This plan, as it appears from the published reports, is essentially identical to the already cited determination contained in the Draft Resolution: it is more radical with respect to the period, since as early as 1 January 1986 the general discount rate and the interest rate on deposits and credits would be adjusted to the "agreed-upon" rate of inflation. In doing so, there would be no change in the present determination that interest rates on term deposits would be positive (above 30 percent).

Why such a heavy blow against the policy of positive interest rates and the policy of a "real exchange rate" for the dinar? Especially since neither is even close to having been achieved, since the average interest rate on all credits covers perhaps somewhat more than 50 percent of the rate of inflation, while the exchange rate for the dinar is such that it ensures current liquidity and a balanced balance of payments, but due almost exclusively to restrictions on imports, which have made the Yugoslav economy a completely closed one, naturally with long-term negative consequences.

Is this an attack on the so-called real economic categories, or rather, on the introduction of economic criteria in business activity, which would also mean a fundamental revision of the already rather dogmatized Long-Term Economic Stabilization Program? Perhaps both, but nevertheless one reservation is also necessary -- economic categories cannot be introduced in business activities through regulations, nor can economic criteria be forced upon enterprises as obligatory ones. There has not even been a capital market, nor will there be one as long as capital is socialized (in the sense in which this concept is understood today), and as long as the economic organizations are state ones, and when there is no money market, there are no measures regulating it. There is not even a foreign exchange market (and there will never be one), and so any story about a policy of a real exchange rate for the dinar is an illusion.

The demands for a change in the present policy on interest rates and the dinar exchange rate are primarily motivated by practical considerations. With the increase in inflation and the decline in the value of one's own funds, the interest burden is becoming increasingly greater for the economy of each sociopolitical community, and exchange rate differences for foreign credits and citizens' foreign exchange savings are accumulating, all of which -- in a system with a state-monopolistic closed economy, in which enterprises operate without risk, and are interested (to some extent) only in the situation on paper, as depicted in the balance of successes -- is reflected in the price of products and services. Furthermore, money is constantly being taken away from economic organizations (with their own money, they cannot even cover 20 percent of the so-called durable working capital), and thus the amount of credits is growing at a dizzying rate -- on 30 September 1985 the economy used over 7,000 billion dinars of credit, of which 4,000 billion dinars of credit was for working capital, in practice for financing the enormously large stocks, the bookkeeping value of which exceeded the social product achieved during the first 9 months of this year.

Transfer Based on Credits

Interest is growing at a dizzying rate. Last year it amounted to 819 billion dinars. During the first 9 months of this year, it reached the amount of 1,355 billion dinars. The economy's earnings from interest are also growing. During the period from January to September 1985 they amounted to 520 billion dinars in the economy, so that the net outflow from the economy as a result of interest was 815 billion dinars.

In addition to the fact that interest expenses constitute a considerable item in calculation of the cost prices of products and services, there is also a transfer between branches. For the organizations in industry, mining, agriculture, and fishing alone, there was a 690 billion dinar net outflow as a result of interest, which constitutes approximately 85 percent of the total burden on the Yugoslav economy. In contrast to the organizations of industry and agriculture, which cover only 28 percent of the interest expenses with interest earnings, the organizations in some other fields achieve considerably more favorable results. This applies to the organizations in construction, general trade, and especially foreign trade.

In addition to the redistribution of income among branches, there is also a territorial aspect. As a rule, the economy in the developed republics and provinces is less burdened with net interest expenses, while the underdeveloped republics and Kosovo are in a considerably more difficult financial situation.

The ratio between interest earned and paid is most unfavorable in the economy of Montenegro, where the interest earnings cover only a little more than 1/5 of the interest paid. The economies of Macedonia and Kosovo cover 1/4 of the interest with interest earnings; the economy of Vojvodina is in a more unfavorable situation than the average for the country, primarily because of larger credits to cover stocks of agricultural products. In the Croatian economy, because of a forced excessive pooling of funds in so-called long-term investments, the situation is also more unfavorable than the average for the country. The rest of the republics are approximately at the average level; the only exception is Slovenia, whose organizations cover exactly 50 percent of the interest expenses with earned interest.

Differences Between the FEC and the NBY

Judging by the draft resolution for 1986, the Federal Executive Council [FEC] would not make any fundamental changes in the present interest policy and the policy on the exchange rate for the dinar. It is, however, planning for inflation in the range of 30 percent, and is subordinating current economic policy measures to the achievement of this goal. The Resolution says that if the economic policy measures adopted do not yield results in the sector of the market and prices, as planned, direct social price controls will be imposed. The President of the FEC does not support social price controls. She thinks (as past practice has proven, after all) that price controls lead to an increase in losses in economic organizations, less of a selection of products, a decline in the quality of products and services, and to shortages even prior to distribution. Does this mean that the Draft Resolution was nevertheless not sufficiently coordinated even within the FEC, which drafted it?

With respect to the concrete interest policy for next year, the FEC has committed itself to a policy of positive interest on term deposits, which would be established, after the expiration of the agreement with the IMF, on the basis of the planned inflation, with the provision that after the expiration of a certain period there would be an adjustment of interest rates in accordance with the actual changes in the prices of industrial products.

As we have learned, the NBY feels (and it is not alone) that today the main sources of inflation are the nominally high interest rates on credits that accompany the rate of inflation, and the exchange rate for the dinar, which is continually adjusted to the difference between the domestic rate of inflation and inflation in the countries of the "basket of currencies." According to the reports that have reached the public, the entire concept of the NBY should be reduced to several measures. First, the rate of inflation of 2 percent monthly, or 30 percent annually, should be protected by all possible measures, including direct social price controls. Second, some of the credits from the primary issue (about 50 percent) should be transformed into long-term credits with a favorable interest rate (for example, 8 percent), but this was also contained in the previous FEC proposals. It is also proposed that credits covered by the business banks be rescheduled. Third, the general discount rate of the NBY, as well as the interest rates for term deposits and for credits, should be coordinated with the planned rate of inflation, which means that they would be a little above 30 percent, so that the interest would be positive. Fourth, a reduction in the (illegal) earnings of the NBY and the national banks of the republics and provinces based on primary issue credits would make it more difficult to manipulate the so-called coverage of the negative exchange rate differences at the NBY (for NBY credits and foreign exchange savings), so that probably part of these exchange rate differences would have to be written off, which naturally will not reduce Yugoslav foreign debts by even a thousandth. Fifth, there is no reason why the NBY, like the FEC, after all, should not accept the slogan about relieving the economy of the burden of contributions for general and joint expenditure.

There will be only two results from all these measures: the transfer of credits from the primary issue, and direct social price controls. When the transfer of part of the credits from the primary issue is proposed, one cannot avoid the following question -- why is the illegal state capital, which is formed on paper through the expropriation of the economy and the population, retrained, while it brings real earnings to the state and real expenses to the economy? A measure has thus been proposed that will temporarily reduce the expenses of the users of these credits, but there will be no substantive changes, since the owners of the money will remain the same and since the reduced earnings of the NBY will be replaced by other issue and inflationary earnings (also on paper).

Social price controls may temporarily curb the rate of inflation, but their consequences will be precisely the ones that were indicated by the FEC president. In the long run, they will be even worse, since the fictitious elements in the balances will be increased, the social criteria in distribution will be expanded even more, and the low productivity and the poor quality of products and services will close the Yugoslav economy to foreign countries for a long time.

Real Problems

A higher interest rate cannot be a source of inflation in a market economy. On the contrary, it stimulates savings and contributes to a more rigorous selection of investments on the basis of profitability. There is no market economy in Yugoslavia, and thus the nominally high interest rate, although it is lower than the rate of inflation, is nevertheless a generator of inflation. Why?

If one excludes the systemic reasons that result in our economic organizations not being commodity producers, two main reasons remain: first, the more unacceptable structure of the sources of working capital, in which the funds owned by economic entities are marginal in covering current reproduction expenses, and second, enormously large stocks of materials, unfinished production, finished products, and goods that at the end of September exceeded the value of the social product for the first 9 months.

On 30 September 1985, the total credits used by the economy amounted to 7,017 billion dinars, which is 75 percent more than two years ago. During the same time, the durable sources of business resources, in which the business fund is dominant, were increased by 59 percent. Of the total credits, 2,949 billion dinars were for credits for fixed capital (from domestic and foreign sources), while the remainder, about 4,000 billion dinars, were for credits for working capital. On 30 September, the total stocks amounted to 5,267 billion dinars, and had increased by 87 percent compared to the situation two years earlier. The largest increase was in the stocks of finished products (held by producers), by 112 percent, while the lowest was in stocks of goods (in trade), by 63 percent. The economy is covering about 20 percent of the total stocks with its own funds (part of the free funds of the business funds for covering working capital), and it is covering the remainder by credits and loans between enterprises.

Seven or eight years ago, the economy covered about 50 percent of the stocks, i.e. the so-called durable working capital, with its own funds. Today this percentage has been reduced to less than 20 percent. Why? It is not primarily a case of financing investments out of working capital. There are other problems involved. First, economic organizations have been forced to invest necessary monetary resources in so-called long-term investments, which induces them to seek new credits. Second, the accounting system is such that it leads to the expropriation of the economy. Because of the high inflation, monetary funds are being reduced in real terms, and so the difference (lost property value) is transferred to consumption -- personal, general, and joint. Otherwise, the effect of inflation can be eliminated by revaluation of the value of the property. The property of the enterprises is contained in the business fund. Part of this property (the fixed assets) is partially revalued, while the part that is in monetary form virtually melts away. Does this have to do with ignorance, or with an intention of leaving the enterprises without money of their own, so that individual representatives of sociopolitical structures would have complete power over economic organizations, and so that the state, on the basis of nonexistent capital, would create earnings (taking income away from the economy and the population) to cover its own financial mistakes?

Incorrect Accounting System

Even with the existing administrative state-property system, improvements are possible that would help it to function better. One of the areas in which these improvements are inevitable is the accounting system. Since 1 January of this year, a mandatory revaluation has been imposed for working capital in the form of things (raw and other materials, minor inventory, unfinished production, finished products, and goods). Since many people have proved that such a revaluation is a source of inflation, since the stocks are primarily covered by credits for which interest is paid that approximately corresponds to the rate of inflation, a change in this regulation has been proposed -- the amount of the revaluation can be reduced by the difference between the interest paid for credits for working capital, and the calculated negative exchange rate differences and the earnings received from interest and the calculated positive exchange rate differences. Both methods of accounting are wrong. Instead of a revaluation of things, it is necessary to revalue property in the form of money that serves to finance current reproduction.

Some economists think that the mistake in the accounting system is that economic organizations cover interest on credits up to the rate of inflation under operating costs. Instead of this, they propose a revaluation of the principal commensurate with the rate of inflation. Such gymnastics mean nothing in reality. We can agree that interest below the rate of inflation is not interest in the classical meaning of this concept. It is an expense, however. If the credit is for fixed assets, this cost is transferred to the cost price of the product through amortization, which is calculated at the value of the fixed assets, which is the same in real terms although nominally larger. If the credits are for working capital, they must also be repaid in what is really the same amount, although nominally larger. Where does the payment for the difference between the present and original nominal value come from? From profits? Certainly not, since this is a question of the same real value that the economic entity had to maintain in current business operations, which means that this difference must be a burden on the operating expenses of OURs [organizations of associated labor].

It is not necessary to prove to anyone that the stocks are enormously large. Why? Because the economic organizations are not interested in the efficient utilization of property, in efficient business operation and earnings. They are interested in showing a positive balance, in bookkeeping terms, for the successes of current business operations, so that they will not have any problems in paying personal incomes. Isn't it possible to change this relationship by changing the accounting system? For example, if it were the rule that at the end of the accounting period the organizations were responsible for covering stocks that had increased, compared to their original status, at the expense of current business results, the growth of the stocks would be stopped. The question is only whether this would contribute to adjusting production to the possibilities for sales, or whether it would lead to a reduction in production.

The interest rate and adjustment of the exchange rate for the dinar (maintenance of the already established parity) are not causes of inflation, but under our conditions they nevertheless stimulate it. It turns out from this that it is necessary to change the conditions, or to cure the main causes of such illogical behavior by our economic entities. First, we should abandon the present method of financing the budget of the sociopolitical communities. Instead of the present method, which is economically easiest but economically and socially the worst, we should introduce a system of progressive taxation of the incomes of households, including a considerably greater taxation of the property of citizens. Second, it is necessary to eliminate fictitious state capital by returning the entire primary issue to economic organizations, as long as the formation of new fictitious capital is prevented. Third, the losses of economic organizations must be covered from real sources, or their continued operation must be stopped. And, fourth, the greatest material problem is foreign debts. This is not a question of credits for equipment, which are used by most of the economic organizations, and which can be repaid. This has to do with the financial credits of the National Bank of Yugoslavia, financial credits converted into dinars, part of the credits for fixed assets which are invested in organizations that will never be able to repay them. Most of all, this has to do with debts that are not backed by real debtors. They must be found, which means that it is necessary to divide them among specific sociopolitical communities, which would be responsible for finding a way to create real earnings, from which they would be able to repay these debts.

ECONOMY YUGOSLAVIA

WESTERN COMMENT ON ECONOMIC CRISIS, NONFUNCTIONING OF SYSTEM

Hamburg DIE ZEIT in German 17, 24 Jan, 7 Feb 86

[Article by Andreas Kohlschuetter: "Tito's Heirs Are Bankrupt--Only an Attitude of Resignation Prevents the Outbreak of Workers' Unrest"; first paragraph is DIE ZEIT introduction]

[17 Jan 86 p 5]

[Text] Belgrade, Jan 86--The Yugoslav multinational state, at one time desirous of building a model countering Soviet communism, is slipping more and more deeply into a crisis. Millions of people live below the poverty limit. Foreign indebtedness amounts to 20 billion dollars. There are no reforms in sight. Future Premier Branko Mikulic has the reputation of a hard-line dogmatist.

Svetislav Durdevic, a junior worker at the Zmaj tractor plant near Belgrade, which recently experienced a 2-day strike, gives vent to his feelings: "It is true that financial demands are behind most strikes, but that is only a pretense. The real reason is human dignity, which in a country supposedly ruled by the working class must fight for survival. We make a minimum living, or even less. We work for wages which will pay for the rent, milk, and perhaps just barely for cigarettes. A twin-class society of the superrich and superpoor has come into being." His conclusion: "I find it incomprehensible that the workers have not yet taken to the street instead of just stopping their machines."

Milos Stanisic, a senior worker at the same tractor plant and at the same time a member of the Belgrade Municipal Committee of the League of Communists, is irate: "We workers are in a desperate situation. Constant price increases, decreases in living standards, and the fact that wages lag behind inflation have brought us to the fringe of existence. We no longer can feed our families. We have lost all interest in working. Thus the workers strike simply because they cannot stand it any longer. We are sick and tired of it."

Zoran Prijobic, a striking metalworker at the "21 May" plant at Radovica, states: "Difficulties are piling up everywhere; nothing is what it should be. One spark is enough to ignite the fire of strike; that is how tense the situation is. I can only smile at all those theories about sudden strike actions triggered by moods of the moment, or claims that laggards and people going it alone are behind the work stoppages." He says: "Spontaneous strikes are out of the question when dissatisfaction is so widespread. We have reached the end of our patience. The working class has nothing to lose and nothing to fear any more."

Deep clouds of crisis are glowering over cold, wintry Yugoslavia. The entire country is covered by a frosty layer of bitterness and resignation. The lack of a political way out has a stifling effect, the economic misery an oppressive one. Even in the Belgrade Central Committee this atmosphere is addressed openly. "We are talking about the shaken confidence of the workers," said a Serbian representative at one of the latest plenary sessions; "no, comrades, the confidence of the workers has not been shaken, it has been utterly destroyed."

The economic indicators of the crisis are indeed depressing:

--Foreign indebtedness amounts to 20 billion dollars. Servicing the debt eats up 40 percent of foreign-currency income. Exports to hard-currency countries are not growing sufficiently. Trade deficits and payment deficits are increasing. International solvency can be insured only through constant debt-restructuring maneuvers.

--Instead of an expected real growth of 3 percent, probably only a meager 1.2 percent was attained in 1985. Productivity is decreasing. Likewise investments, and thus also capacities for industrial modernization and procurement of jobs, have been decreasing--for the past 6 years.

--The number of unemployed has gone over the million mark, now amounting to 17 to 20 percent. In the underdeveloped Province of Kosovo it is as high as 30 percent, and among the young it amounts to more than 70 percent.

--The rate of inflation is about 80 percent, with the government office for statistics pegging price increases "of products most needed by the population" last year at 104.4 percent.

--Real income has dropped more than 40 percent in the past 5 years--"to the level of 1967-1970," according to Ante Gavranovic, chief editor of the economic journal PRIVREDNI VJESNIK.

These key economic data reflect increasingly precarious economic straits of broad strata of the population. According to a statement by a Central Committee member, only 5 percent of Yugoslav households can make do with their regular income. As the government admitted at the end of the year, 69.5 percent of those employed, or a total of 4.5 million workers, earn less than a minimum living, pegged very low as it is (not including medicine and cigarettes). Including members of families, 8 or 9 million Yugoslav (of a total of 22 million) are below the poverty limit.

In Macedonia, for instance, an average monthly income of 29,500 dinars ($98)--not attained, in fact, by 70 percent of the working people--in a family of four contrasts with a need for foodstuffs amounting to 38,000 dinars ($126). In ore mines, miners even work for only a miserable 13,000 dinars ($43) a month. Pensioners have to make do with 10,000 dinars. "Thousands of families in the center of Belgrade" had their electricity and power for heating turned off, according to Member of Parliament Zarija Martinovic, because they could not pay their bills any longer. The workers of the Sloboda plant in Cacak, Serbia, the newspaper INTERVJU reported recently, were "seen crying when they received their monthly wages."

Zagreb sociologist Josip Zupanov says it is a "Yugoslav miracle" that there have not been any mass demonstrations, workers' revolts, and open outbreaks of popular indignation against the regime. He refines this statement immediately, though, by stating that it is a "negative miracle at the expense of industrial efficiency which is pushing us deeper and deeper into the crisis." What is clear, however, is that the pressure from below is not yet so strong, and the economic impoverishment as yet not so direct and pervasive, as to compel the communist power apparatus to make major changes and institute a true reform of the system. "The moment of truth has not yet arrived," comments a U.S. diplomat; "as yet, things can go on like this, despite the fact that the water already reaches up to people's necks in Yugoslavia."

For one thing, strikes--neither permitted nor prohibited but tolerated--which doubled in 1985 compared with the year before, reaching a record number of over 700, have the effect of lightning rods in relieving social tensions, the more so because in the completely atomized economic structure no kind of fronts of solidarity are emerging which might reach beyond the narrow limits of individual enterprises or even the individual republics. One would not dream of an all-Yugoslav solidarnosc movement on Polish lines. The strike fronts, built around wage demands in 90 percent of the cases, generally can be solved quickly and smoothly by financial concessions. This occurs at the expense of a longer term economic reform, however, without regard for production criteria or the urgently required differentiation of wages between profitable and unprofitable enterprises.

Another variant of the workers' protest generally tolerated by the regime is slovenliness and idleness on the job. It is passive resistance under the uppity slogan "You just cannot pay me as little as I work." It included a whole repertory of possible behavior enumerated in the weekly NIN: "Arriving late for work, feigning illness, unauthorized absence, loafing on the job, negligent maintenance of the machinery inventory, and damaging of products and machines."

The arising economic losses are horrendous. In the opinion of a Slovene economist, of 7 work hours a day, there are "only 2 or 3 hours in which any real work is done." No wonder it takes three to five times as long in Yugoslavia as in the FRG to make radios, vacuum cleaners, washing machines, and television sets. Professor Zupanov comments: "Our working class is patient, but it presents its bill to society in the form of low productivity, which is one of the sources of our economic and social crisis."

Of quite crucial importance for insuring one's existence in Yugoslavia and earning one's daily bread is the flourishing "gray" economy. It offers a chance to mitigate the "socialism of pauperization" of the Tito state. Painters, plumbers, masons, and electricians engage in illicit work after hours and on weekends. "Part-time farmers" take it easy during work in the plant in order to be able to devote their unspent energy to farming afterward. Many Yugoslavs rent out their rooms to tourists with foreign currency, with about half of last year's income from tourism, which amounted to more than 2 billion dollars, flowing into private pockets. Owners of hard-currency accounts fed with income from work in the West finance the feverish construction activity which can be observed in all villages.

Yields from the "gray economy" in the case of many Yugoslavs cause wages to become side earnings. These yields amount to an estimated 40 percent of the GNP. And only this explains why despite a 40-percent drop in real wages since 1980 consumers' expenditures have decreased only about 5 percent.

It also explains why many Yugoslavs continue to be able to go to the Adriatic coast for their vacations and why quite a few Slovenes continue to go shopping in the Austrian town of Klagenfurt. Illicit work creates reserves which, though unable to stop the growing pauperization, can prevent mass starvation and make the economic situation more tolerable than it is portrayed by the statistics. The army of millions of underpaid, unemployed, and pensioners who are not supported by an extended family and have no rural roots are left out in the cold, however.

Finally, safety valves against social unrest are also provided by the freedom to take trips, the possibility of seeking work in the West, and the mercilessly open crisis debate in the media. A young Belgrade taxi driver out of work as a business employee curses the whole "communism-Titoism," but his ire is limited by the prospect of a job at a pizzeria in Stockholm, which he hopes will pay for "a new radio taxi and perhaps a New Year's Day celebration in Vienna."

The whole Yugoslav misery is spread out in the press with unsparing detailed criticism of state and party. The radio spreads such biting comments as the following: "Why is milk getting more and more scarce and expensive? Because there are more and more oxen in this country." Television shows the inhabitants of a village armed with axes and shovels defending themselves successfully against police in the disappropriation of land for building a factory. There was a broadcast of a remark by a worker that it would make no sense to demand the overthrow of the workers government considering that the workers were already in an extremely poor position. "We cannot change anything but can say almost anything," says PEN club writer Predrag Matvejevic; "there is hardly any democracy in this country, but there is an enormous amount of freedom."

An expert who has observed Yugoslavia for many years sums up the crisis situation in the multinational Balkan country saying: "Tito is gone, the money is gone, the elan is gone." This is exactly the impression one gains everywhere--in Ljubljana, Zagreb, Sarajevo, and Belgrade. The inspiring

"Yugoslav model," the hopeful "third way" between East and West, which at one time triggered so much intellectual elan and worldwide enthusiasm, is passe. Yugoslavia's clocks do not show a different time any more; they simply have stopped.

[24 Jan 86 p 7]

[This instalment is headed "The Way to Standstill--Disgruntlement With the State and Resignation Have Assumed Threatening Proportions--Tito Wanted to Avoid Fights for Succession and Between Nationalities, but His Heritage Is Proving a Shackle for Yugoslavia"]

[Text] Belgrade, Jan 86--Asked about what kind of mood he is in, the Zagreb sociologist responds: Emptiness, boredom, resignation." His students, he describes as "disinterested, uncommitted, disinclined toward any debate, and full of anxiety about the future and pessimism." The critical sociologist Ljubomir Tadic in Belgrade describes the Yuguslav crisis as "incurable total paralyzation." And the philosopher and reform Marxist Gajo Petrovic speaks of a "horrible lack of perspective in theory and practice," of an "incredible inability of the system to change."

The three scholars all point to the "political roots" of the problems in Yugoslavia--the lack of a market economy and democracy. They deplore the competing power and economic interests of the individual republics and nationalities (Slovenia, Croatia, Bosnia, Serbia, Montenegro, Macedonia) and the "atomization" into "hegemonic communist natiocracies which prevent any kind of all-Yugoslav drafting, decisionmaking, or action" (Tadic).

"Yugoslavia is dead, not as a state but as an idea," says the prominent critic of the regime Milvan Djilas. The dismemberment protects the regime because no cohesive blocs of opposition can emerge and--in contrast with Poland--the resisting workers, the churches, and the intellectual intelligensia are affected by the nationalist fission fungus. At the same time, however, the fragmentation weakens the regime because it makes it inefficient and thus discredits it. One journalist complains: "Since 1980 and since Tito's death, the Central Committee has convened more than 30 times to deal with serious problems in politics and industry which allegedly could not be put off--and nothing happened."

Though Yugoslavia is not facing collapse, the government authority is increasingly called into question. This is shown by the "new quality" of many strikes which, all official assurances notwithstanding, contain more than wage demands and internal factory disputes. Disgruntlement about party and union bosses is clearly on the increase. "They treat us like enemies, they live off our money, and they do not share our fate," it is being stated in the plants. The dissatisfaction with the workers' self-administration being manipulated from outside and from above is rising: "We have no influence on decisions and cannot even elect our director." Thee is an increase in vociferous appeals to the party and state leadership at long last to "make clear-cut decisions in order to lead the country out of the crisis."

The decrease in muscle of the power apparatus can also be recognized by the warnings of high officials that the party is losing the working class. In fact more and more disillusioned workers are quitting the state trade union league. Further, of the 75,000 Yugoslavs who quit the party in 1984, more than half were workers. One student from Ljubljana who became an enthusiastic party comrade at 16 now has had enough. She says: "One cannot accomplish or move anything, exercise any influence on decisions; genuine criticism is not allowed; there is no end of hypocrites and careerists."

Opinion polls in Croatia show a rapid growth of religiousness particularly among workers. Whereas in 1968 only 33 percent of the young people polled described themselves as "religious," the figure in 1985 was 52 percent, of which more than 75 percent were children of workers. The idols of these people are Mother Theresa and the pope. Lenin comes in in 11th place, and Tito is not mentioned.

What is important, though, is one's nationality. The proletariat in Croatia and Slovenia, sworn to the "unity and fraternity" of socialist Yugoslavia, lets itself be carried away to the worst mob actions at soccer and hockey games, as well as dance festivals, against people of other nationalities from Belgrade or from the "lower" parts of the country. On the facade of the building of a municipal administration in Slovenia, one could see for days the offensive graffito "Entry prohibited to people from the south and dogs."

Five years after Tito it is clear that the system created by the founder of the state does not work without him--neither politically nor economically. The 10 pillars with which he meant to support and strengthen Yugoslavia are turning out to be of faulty design.

1--The constitution of 1974: With it, Tito's chief ideologist, Edvard Kardelj, meant to put an end to Belgrade centralism, bureaucratism, and etatism and, on top of that, take the wind out of the sails of the nationalism which had emerged in the six republics and the two autonomous provinces, Vojvodina and Kosovo. The Belgrade Federal Government was literally disappropriated, having to cede most of its domestic political, particularly economic, responsibilities to the "sovereign" components of the federation. Just as in the party--divided into eight individual organizations on the same pattern--the member states are now in charge of the Yugoslav government. Their representatives form the eight-member national presidium, renewed in regular rotational shifts, which furnishes the national president for a year at a time. They appoint the premier from their midst for 4 years at a time, select "their" cabinet ministers, and dictate to "their" delegates in the two chambers of the Federal parliament how to vote on Federal legislation.

All bodies are ruled by the consensus principle, combined with the right of veto of each individual republic or autonomous province. This is even true where the constitution does not prescribe it, for example during votes in the council of ministers. Thanks to narrow particularist interests, Federal authorities at any time can be blocked by a veto and be enslaved by the lowest common denominator.

Najdan Pasic, leading party jurist and president of the Serbian Constitutional Court, blames for this "exaggeration of the unanimity rule" a "downright pathological fear of centralization" which goes back to "bad memories of the monarchy, civil war, and Stalinism." Tito wanted to prevent any fights for his succession and to make sure that after his death no faction, nationality, or strong personality could win the upper hand. His wish was fulfilled, but at the expense of far-reaching paralyzation of the central Federal authorities, whose inadequate power makes it very difficult, if not impossible, effectively to cope with the crisis. It sounded like a cri de coeur when Premier Milka Planinc recently rebutted those who criticized the allegedly hesitant government action in the crisis by saying: "With what right is all this being expected of the Federal Government, whose responsibility and authority is so limited and is not equal to the demands being made of it?"

2--The law about united work or self-administration of 1976: This giant work of 617 articles, a constitutional jungle in which no worker can find his way any longer, was meant to crown the liberation of the Yugoslav proletariat from paid labor, state and party bureaucracy, and decisions by others. The utopia of rule by the base was to become reality. Thus, on the basis of the constitution and the law of self-administration, Yugoslav industry was divided into about 30,000 autonomous "basic organizatons of united work." These administrative and financially independent economic entities (the Federal Railway alone is composed of 350 separate units) administer themselves through workers councils. In their enterprises, they determine wages, products, prices, ways of marketing, and the procurement of credit and capital and send their representatives to the next higher self-administration level. Originally all of Yugoslavia was to administer itself in accordance with this system.

But the "third way" between capitalism and communism led to chaos, to economic and political dead ends from which the country now no longer can find a way out. Smashed were the unity of the domestic market, all possibilities of coordinated economic management, and also any development of market economy laws, corrections, and stimuli.

An attempt--not very successful--was made to control the disarray with so-called "social agreements" between the self-administration enterprises and with branch cartels. The economic enterprises escalated, the self-administering enterprises were utterly overtaxed, wages and prices rose enormously, and labor discipline and productivity declined. In the words of Leo Mates, former director of the Belgrade Institute for International Affairs, in lieu of the central state and party bureaucracy "dumber and more malign republican and communal apparatshiks" arrogated the power of intervening in the economy. The workers' self-administration became an integral component of the "policentrist etatism" with its eight "sovereign" egotistically high-handed command centers. In the final analysis, their efforts for autarky are responsible for the grotesquely wrong Yugoslav investments, the utterly unprofitable establishment of superflous and uncoordinated lines of production, and the country's massive foreign indebtedness.

The self-administration democracy is the real nucleus of the Yugoslav malaise, which is being fed by the unbridgeably wide gap between social dreaming and political reality. "The liberation of the workers from production, as the self-administration model demands it, has never taken place," says Leo Mates; "workers' democracy has never worked, and management is making all the decisions."

Management, which uses the workers council for implementing its instructions, is supported by local party and state officials--with the same person acting in several capacities, or extreme favoritism. "The integration of economic democracy and ideology is not succeeding," admits Deputy Economics Secretary Novenka Pecar-Sindic. As a party ideologist put it, "direct democracy on the basis of self-administration, if it is genuine, means rejection of the (power) monopoly and therefore is irreconcilable with the system of party rule." The great idea of workers' self-administration was based on the illusion of the state and party dying off, but there cannot be any question of that in Yugoslavia.

In Loznica, Serbia, the worker Vidoje Jancic notes: "Our political system is in a profound crisis, but many people in their comfortable chairs still behave like ostriches, pretending not to see anything." A few kilometers away, on the other (Bosnian) side of the Drina, one can read, chiseled in stone, under a huge portrait of Tito: "Comrade Tito, we swear to you that we will not desert your road." To what extent is that still possible?

[7 Feb 86 p 15]

This instalment is headed "The Monopoly of Impotence--Yugoslavs Place Little Hope in New Belgrade Premier Branko Mikulic--Key Problems Are Being Discussed Openly and in Detail in Yugoslavia, but There Is No Foreseeable End to the Crisis"]

[Text] Belgrade, late Jan 86--The politically dark spots in Yugoslavia include the Republic of Bosnia-Herzegovina, whose onetime president, chairman of the Olympic Winter Games of Sarajevo, Branko Mikulic, takes over as premier in Belgrade in May. He bears the stamp of the strained ideology with which this fragile republic of Croats, Serbs, and primarily Muslims is being administered.

In Bosnia, Yugoslavia's unsolved multinational problems are reflected in miniature. There historical reminiscences of Turkish, Austro-Hungarian, and monarchist Greater Serbian times, and of civil wars, are being kept alive. The bloody history with its reservoir of hate and discord has remained alive. It is being opposed by the communist leadership with dogmatism and thumb screws, with pigheaded resistance against any ideological relaxation and liberation. For heaven's sake, no experiments with a market economy and private initiative, and no mercy for dissidence and criticism of the regime! That is the Bosnian word which Mikulic will take with him to Belgrade when he becomes premier.

As far as civil and human rights are concerned, Bosnia represents a veritable black mark for a Yugoslavia which is interested in being presentable by European standards. An example is the draconian sentence against an alleged "group" of 12 Muslim intellectuals, recently slightly reduced by the Belgrade Federal Court in the last instance. They had been sentenced in Sarajevo in the summer of 1983 for "counterrevolutionary activity," for "hostile propaganda," and for "Muslim nationalism" to imprisonment ranging from 6 months to 15 years.

The trial scene was spectrally Stalinist. Without waiting for the judgment, party leaders and propagandists--with Mikulic in the lead--and Yugoslav media stamped the defendants as "conspirators, traitors, enemies of the people, and terrorists." During the televised pronouncement of the sentence, the court was packed with applauding party activists. The public has been aroused with a hate campaign awakening old anti-Muslim mob instincts.

Supposed witnesses for the prosecution, however, retracted in court their incriminating written statements and complained about police maltreatment, blackmail, and threats. A student stated that the investigating authorities had beaten her and forced her for days on end to learn her prefabricated testimony by heart. One witness retracted and then could not be found for a week, only to reappear in court, newly prepared by the Police, to retract his retraction. Even the judge, Rizah Hadzic, himself a Muslim, was bothered by a bad conscience after the trial--his last. He made an offer to the families of the defendants to serve gratis as their attorney in appealing his own sentence. He admitted that Belgrade fellow lawyers had "tied his hands from above" during the trial.

The trial brought the alleged counterrevolutionaries 90 years of imprisonment--90 years for an abstract endangering of the state, for discussing in the most intimate circles religious theses of Islam, which according to the Yugoslav constitution enjoys religious freedom. This is a textbook case of judicial terrorism--a political and arbitrary Bosnian trial where human conviction rather than an actual deed became a crime.

Return of Dogmatists?

Under these portents, pessimists regard the ineluctable rise of Branko Mikulic to the office of premier as an indication of the return to power by dogmatists and hard-liners. After all, they say, in Yugoslavia, where all human rights are subject to the prevailing "interests of socialism and the working class," freedom is subject to revision, and all democracy reversible.

"Optimists, on the other hand, assume that the liberalization, propelled by the constraints of economic issues and crises, can no longer be reversed. And, finally, minimalists prophesy a "muddling through" of long duration without any clear decision for one or the other orientation.

Indeed there are no recognizable signposts or routes leading out of the Yugoslav crisis mess. "The crisis is strengthening all forces, nationalists and centralists, democrats and supporters of a strongman's policy, reformers and dogmatists," says Zeljko Brihta, commentator of the Zagreb newspaper VJESNIK.

The hard-liners, at any rate, are not satisfied with the present course. They mess around in the economy, gripe about the "imperialist interest servitude" the country has gone in for--being up to its ears in debt to the International Monetary Fund and 600 Western banks. While Yugoslavia, with a debt of about 50 billion Deutsche marks [approximately $21 billion] in the West, has just announced that it will continue to work with the IMF, the dogmatists in the country are already shaking the foundations of the stabilization program passed under IMF guidance in 1983, which prescribes market laws and austerity. They are trying to stop the market-free, and therefore higher, formation of prices. They have already undermined an important part of the IMF anti-inflation policy and prevented the establishment of "real interest rates" adapted to the level of inflation. They resist the stimulation of private industrial energies and the abolition of a regulation which limits the land of private farmers to 10 hectares, while 2 million hectares of agricultural and pasture land lie fallow and Yugoslavia has to import foodstuffs. They are blocking the expansion of small private industry, setting limits for the number of employed, and creating credit and import obstacles, and engaging in bureaucratic chicanery. This is not the way to create hundreds of thousands of jobs for more than a million unemployed: long live socialist equality in poverty!

The state of which Mikulic will take charge as yet is pursuing a more liberal policy. It appears that after a 5-year delay a post-Tito era is to begin. "After Tito's death we were in shock, clung to continuity and unity, and did not want to touch or change anything," says Nijaz Dizdarevic, and intellectually impressive leading communist official from Bosnia; "only now is life without Tito actually beginning, with his testament not to be taken literally but to be adapted to new kinds of needs." Boris Muzevic, secretary in the Belgrade party Presidium, declares 1985 to be the "beginning of the Yugoslav phase of sobering up," of "transition to real alternatives." And he promises, "For 30 years we have tried to put words into action; now we will do so in earnest."

It is a bold promise, though some things have already been set in motion. The crisis debate is being conducted with an impressive openness, supported by an extremely critical self-diagnosis and a diagnosis of the system which would be unthinkable in other communist-ruled countries. The key problems are being identified correctly.

What is at stake is the role of the party, which theoretically has forgone its power monopoly over state and economy since 1952 but which in practice, according to the newspaper DANAS, "is arrogating all decisionmaking," and is doing so "without any regard to the democratic procedures prescribed by the constitution." What is at stake is the central question of political and economic responsibility. What is being debated further is a renovation of the weakly workers' self-administration, split into mini-units and dominated by technocrats, local bureaucrats, and state and party officials. The market economy, differentiation of wages, and the closing of unprofitable enterprises are being conjured up. One deplores the separatist division of Yugoslavia into competing interest groups in the state, the party, and the economy, being guided by the interests of six republics, two autonomous provinces, and eight nationalities. And one deplores what Boris Muzevic calls the "monopoly of impotence" at the Federal level.

Should one first change the political or the economic system? Is it in fact necessary to change the system? Is the crisis not just being caused by an erroneous interpretation of the constitution and a flawed implementation of the workers' self-administration? Is it not human failure and "a lack of awareness" rather than the existing structures and institutions that are to be blamed for the whole misery?

Many questions, and no conclusive answers. A lot of rhetorical wind but no movement. Nejdan Pasic, party ideologist and president of the Serbian Constitutional Court, is right when he says: "In criticism, we are radical; in analyzing the roots of the crisis, already less so; and when it comes down to concrete solutions, hardly any radicalism can be felt any longer." Pasic was a member of a government commission which after years of drudgery and consulting hundreds of experts came up with a "critical analysis of the political system." According to Pasic, it yielded virtually nothing and by and large had to be content with "political-moral messages."

The bottom line of the reform debate in Yugoslavia, conducted at great expense and with a lot of noise, is a few reform band-aids which cannot close the crisis wound by any means. The principle is: Yes to economic corrections, no to system reform.
